3. In a machine for waterproofing fabrics, the combination of a mass of solid waterproofing material, a hollow cylinder of flexible material adapted to hold water, and the supporting-rollers F, G, and H, which hold the said hollow cylinder against the mass of waterproofing material, substantially as set forth.

4. In a machine for waterproofing fabrics, the combination, with the devices for feeding the fabric through the machine, of a slab of solid waterproofing material of greater length than the width of the fabric to be waterproofed, and having its ends beveled, and a holder for the slab of waterproofing material, substantially as and for the purpose set forth.

411,082. SPINNING-MULE. EDWARD WHERRY, Worcester, assignor to the Davis & Furber Machine Company, North Andover, Mass. Filed Nov. 7, 1888. Serial No. 290,231. (No model.)

Brief.—The invention consists in improvements upon the machine described in Letters Patent No. 370,840, dated September 20, 1887, and has for its object to provide mechanism of superior efficiency and practical utility for the purposes intended.

Claim.—1. The combination, substantially as described, of the backwardly and forwardly movable roll-beam D, supported by guides *a* on the frame and provided with the trip-piece *d*, the rocker-shaft R, mounted in bearings on the beam-supporting frame and provided with fingers R' R^2 R^3 and arm R^4, the escapement lever L, having the upright bifurcated arm with engaging-lugs *i i*, and the horizontal

arm L', fulcrumed at its angle in connection with the bed A', the rod *l*, connecting the arm L of said lever with the arm R^4 of the rock-shaft, and the cam-shaft I, having the escapement-wheel fitted for engagement by said lugs *i i* on the escapement-lever, all arranged and operating as set forth.

2. The escapement-lever constructed with a bifurcated top carrying the steel detents *i*, and having the arm L, and the spring-brake L^5, acting against said arm, in combination with the escapement-ratchet having its teeth externally disposed, the connecting-rod *l*, rocker-shaft R, and its actuating mechanism, substantially as and for the purpose set forth.

3. The combination, with the draft-scroll and in-drawing scroll, of a yielding take-up or tension band connecting both of said scrolls, and a spring connected to said band by a running attachment for simultaneously giving tension on both of said scrolls, while the take-up is free to adjust itself to the action of either scroll, substantially as set forth.

4. The combination of the scrolls J and K, the drums J^3 and K^3, the band or strap O, guide-sheaves O', pulley O^2, and spring O^3, substantially as and for the purposes set forth.

5. The combination, with the scrolls and tension take-up strap, of the take-up drum mounted to turn loose on the shaft or hub of one of the scrolls, the scroll-hub provided with a ratchet-wheel J^4, and the pawl J^5, pivoted to the drum and engaging said ratchet, substantially as and for the purpose set forth.

6. The combination, with the back shaft, the auxiliary scroll, and scroll-rope winding thereon, of the adjustable rope-holding hub provided with means for the attachment of the end of the scroll-rope thereto, mounted loose upon said shaft adjacent to the end of said auxiliary scroll, said hub and scroll being formed with intermatching lugs and notches that prevent backward rotation of said rope-holding hub when the adjacent end faces of said hub and scroll are brought together, substantially as set forth.

7. The combination, with the movable roll-beam, the roving-delivering rolls, the roll-operating chain, and the sprocket-wheels that carry said chain, of an auxiliary starting-clutch in connection with the roving-delivering-roll shaft, a chain and operating-gear to rotate said clutch, and an actuating-dog attached to the stationary part of the machine, that engages and imparts movement thereto as said roll-beam approaches the spindles, as set forth, for starting the roving feed an instant before the roll-beam reaches its forward limit of movement.

8. The combination, with the roving-carrier or roll-beam, roving-delivery rolls, their drive-chain, and sprocket-wheel E^2, internally ratcheted at *c*, of the disk or wheel E^3, mounted on the roll-shaft and carrying the pawl c^2, the swinging arm E^5, the connecting-chain E^6, strap d^3, and spring D^5, and dog a^6, substantially as and for the purpose set forth.

9. The combination of the carrier 10, longitudinally-movable plate 17, its top edge having the level and inclined portions and carrying nut 18 and cam-block 22, the slide 20, having the pin 19, the cop-forming bar 21, hinged at its rear end to said slide, the cop-builder

arm X, having roll *x*, that travels on said bar, the stop-dog 24, the shaft 14, having screw-threads 15, the pulley 25, pawl 26, ratchet 27, chain 28, arm 29, weight 30, and sheave 31, for rotating said shaft, all arranged for operation substantially as set forth.

10. The combination, with the movable carrier having the cop-builder mechanism supported thereon and the quadrant-arm that governs the action of the winding-chain, of an inclined guide supported on said carrier, a quadrant-operator that receives its movement from said guide, and connections for transmitting motion from said quadrant-operator to the quadrant-arm, substantially as described, whereby said arm is caused to act in unison with the action of the cop-builder mechanism.

11. The combination, with the carrier having cop-builder mechanism mounted thereon and the quadrant-arm that governs the action of the winding-chain, of an adjustable inclined guideway supported and hinged upon said carrier, a movable brace and slide-block for raising and depressing the free end of said guideway, a quadrant-operator that receives movement from said guideway, connections for transmitting motion from the quadrant-operator to the quadrant-arm, and means, substantially as described, for adjusting the inclination of said guideway simultaneously with the adjustment of the cop-builder plate, for the purposes set forth.

12. In a spinning-machine, in combination with the winding-drum, winding-chain, fallers, and faller-locking mechanism, the quadrant and cop-builder mechanism arranged for conjunctive action, substantially as described, means for operating the quadrant, together with the cop-builder, an adjuster-shaft with an actuating-ratchet, and a plurality of engaging-screws, whereby both the quadrant and cop-builder are controlled or adjusted at the same operation simultaneously, as set forth.

13. The combination of the carrier 10, the cop-builder plate 17, longitudinally movable on the carrier, the adjustable guide 32, its support 33, and the slide-block 34, the adjusting-shaft 14, supported in bearings on said carrier and provided with a screw-thread 15, engaging with a nut fixed to said cop-builder plate, and a screw-thread 16, engaging a threaded opening in the slide-block, and the rod 35, having one of its ends connected with the cop-builder plate and its other end extending through an opening in said slide-block, screw-threaded, and provided with adjusting-nuts, for the purpose set forth.

14. The combination, with the adjusting screw-shaft mounted on the carrier and the actuating-gear for said carrier, of the loose pulley 25, the interchangeable ratchet-wheel 27, keyed on the shaft, the pawl 26, pivoted on said pulley, the chain 28, attached to said pulley, the swinging arm 29, pivoted to a stationary support with its movable end attached to said chain, a counter-weight 30, and the sheave 31, connected with said carrier for imparting intermittent rotative action to said shaft, substantially as set forth.

15. The adjustable inclined guide 32, its supporting-brace 33, and slide-block 34, in combination with the carrier 10, adjusting-shaft 14, having the screw-thread 16, quadrant-operator 38, having a shoe 36, that works on said guide, quadrant-arm 40, carrying the sheave 41, connections for transmitting motion to said arm from the quadrant-operator, and means, substantially as described, for moving said carrier backward and forward, substantially as set forth.

16. The combination, with the movable roll-beams carrying the sheave d^9, the winding-drum C^9 on the cylinder-shaft, and the winding or quadrant chain 44, of the arm 40, swinging on an axis at A^2 and provided with a sheave 41, that carries said chain, the quadrant-operator 38, fulcrumed at A^2 and having connection for moving said arm, the cop-builder carrier 10, an adjustable hinged guide 32 thereon for actuating said quadrant-operator, a slide-block and hinged brace supporting said guide, the cop-builder plate, the adjusting-shaft having screw-threads 16 and 15, respectively fitted for moving said slide-block and the cop-builder plate, and the rod 35, provided with an adjustable stop or nuts, connecting said slide-blocks and cop-builder plate, substantially as and for the purpose set forth.

17. The quadrant-arm 40, having an upwardly-extending end 42, to which the end of the winding-chain is attached, in combination with the cylinder winding-drum, winding-chain 44, guide-sheave 41, roll-beam D, sheave d^9, quadrant-operator 38, operator-connections 39, and means for actuating said quadrant-operator, substantially as and for the purpose set forth.

18. The combination of the cylinder winding-drum, winding-chain 44, quadrant-arm 40, quadrant-operator 38, adjustable quadrant-operator guide 32, its movable support-block 34 and brace 38, adjusting-shaft 14, with screw-threads 16, an interchangeable ratchet 27 on said shaft, a pawl 26, pivoted on the rotating sheave-disk 25 and engaging with said ratchet, and means, substantially as described, for operating the same, as and for the purpose set forth.

19. The adjustable inclined bar 32, having its hinged supporting-brace, and slide-block 34, adapted to move past the center or vertical plane of the hinging axis of the brace, in combination with the reciprocating carrier 10, quadrant-operator 38, actuated by said inclined bar, and the adjusting-screw 16, mounted in bearings on the reciprocating carrier for shifting said slide-block and support, substantially as set forth.

20. The inclined guideway 32, having an oil-well 37 formed in the lower end thereof, and the bearing-shoe on the end of the quadrant-operator adapted to dip into the oil-well, in combination with the quadrant-operator, the movable carrier whereon said guideway is supported, and means, substantially as set forth, for imparting motion thereto.

21. The combination, with the cop-builder and quadrant-operator mechanisms, of the reciprocating carrier having a bearing-boss on its lower side and a support or pillow-block 8, provided with a bearing-surface on which said boss slides, a depression or channel at the ends thereof, and an upwardly-extending lip or flange surrounding said bearing-surface, substantially as and for the purpose set forth.

22. In combination with the roll-beam or roving carrier D, winding-chain 44, and cop-builder arm X, the swing-lever 46, carrying a pulley 47, that engages said chain, a ratcheted actuating-bar 48, connected with said lever, a lifting-lever 50, for raising and depressing the ratcheted end of said actuating-bar, a connection 51, for moving said lifting-lever with the cop-builder arm, and a lug or detent 49 connected with the roll-beam that engages the ratcheted end of said actuating-bar and imparts movement thereto, for the purpose set forth.

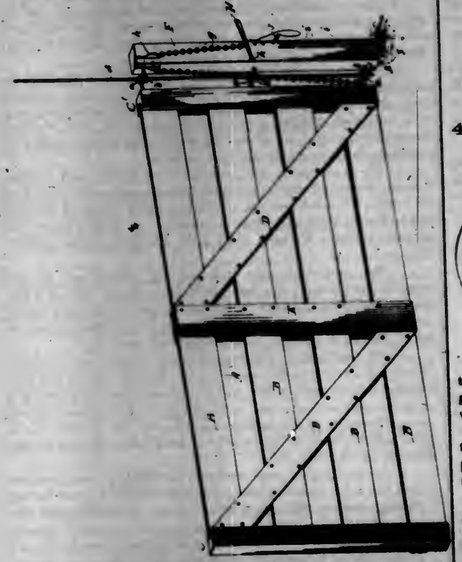
23. The combination of the cylinder C, drum C^9, winding-chain 44, roll-beam D, carrying guide-sheave d^9 and lug 49, quadrant-arm 40, carrying-sheave 41, connecting-chain 39, quadrant-operator 38, adjustable incline 32, its lifting-arm 33 and slide-block 34, reciprocative carrier 10, with the cop-builder mechanism, and adjusting-shaft 14, with screws 15 and 16, mounted on the reciprocating carrier, the cop-builder arm X, faller-lock F, fallers f, take-up lever 46, carrying-sheave 47, ratcheted actuating-bar 48, lifting-lever 50, connection 51, and operating-detent 49, substantially as and for the purposes set forth.

24. The spring-bar 52, in combination with the faller-lock mechanism, roll-beam D, having the detent 49, take-up actuating-bar 48, its lifting-lever 50, and connecting-chain 51, substantially as and for the purpose set forth.

25. The combination, substantially as described, of the roll-beam D, the chains D^4, attached thereto, the sprocket-wheels B', the back shaft B, a scroll or disk M, fixed on said shaft and carrying a stud 62, a counterbalanced lever mounted upon a screw-threaded hub fixed on said shaft adjacent to the disk and provided with a stud 61 for engagement with said stud 62, and an operating-connection 57, attached to the arm of said lever, and means for imparting motion thereto, for the purpose set forth.

26. The combination, substantially as described, of the back shaft B, the scroll or disk M, fixed thereon and carrying the stud 62, the counterbalanced lever 58, fulcrumed upon a screw-threaded hub fixed on said shaft and carrying the pin 61, the worm-wheel 54, carrying a crank, and connection 57, for operating said lever, a swinging bracket whereon said worm-wheel is mounted, having the spring-arm 55, the cam-shaft I, provided with a cam that engages said arm, and a worm-screw 56 and shaft for operating said worm-wheel, for the purposes set forth.

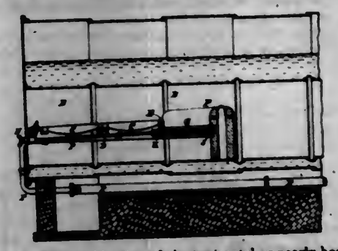
27. The combination, with the quadrant-arm, its chain, and the winding-drum on the cylinder-shaft in a spinning-machine, of a frictional belt acting on said drum in opposition to the draft of the chain with force sufficient for winding the chain thereon when slack, but whose force is easily overcome by the draft of the chain-operating mechanism in action when winding up the yarn, substantially as set forth.



28. The combination, with the winding-chain 44, winding-drum C^9, and auxiliary shaft Q, of the friction-belt 71, its pulley 70, and the counterweighted lever 72, carrying a tightening-pulley 73, that is pressed against said belt by the counter-weight to give friction on the winding-drum for winding up the quadrant-chain, substantially as set forth.

29. The combination, substantially as described, with the faller-lock, escapement-lever, and roll-beam, of the trip-bar 76, pivoted upon the faller-lock, with its rear end in line with a lug on said escapement-lever L, and having the lug or stud 78 near its forward end, the upright lever 80, pivoted at its lower end and its upper end at position to engage the roll-beam, and centrally provided with an adjustable plate 79, for engaging the lug 76 on said trip-bar, all arranged and operating substantially as and for the purpose set forth.

30. The combination, with the movable roll-beam D and counter-faller *f'*, of a lever 85, one end of which is connected with the counter-faller by a cord or chain 87 and its opposite end having a cam or inclined surface on which the roll-beam engages when at backward position, substantially as and for the purpose set forth.

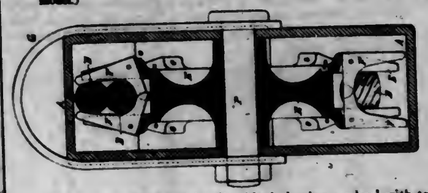


31. The combination, with the movable roll-beam, the indicator-clock, and indicator-operating mechanism mounted thereon, of a guideway *a*, upon which the roll-beam travels, provided with a depression having the inclined surface 98 formed thereon, and the pawl actuating bar 97, arranged to drop into said depression and receive movement from said incline as the roll-beam passes over the same, substantially as set forth.

411,088. FARM-GATE. Byron L. Zimmerman, Belle Centre, Ohio.
Filed June 26, 1888. Serial No. 278,305. (No model.)

Claim.—The combination of a gate hinged, as shown, upon a vertical rod supported by its hinge-post, a pulley pivoted in a slot of said post, a chain passing over the pulley and connecting the lower hinge-eye of the gate with a lever fulcrumed upon the post, and a pin adjustable in a series of holes in the hinge-post to secure the lever in any position desired.

411,084. STEAM-BOILER OR OTHER FURNACE. James H. Ahrendale, Pelton, County of Mid-Lothian, Scotland. Filed Jan. 24, 1889. Serial No. 297,412. (No model.)



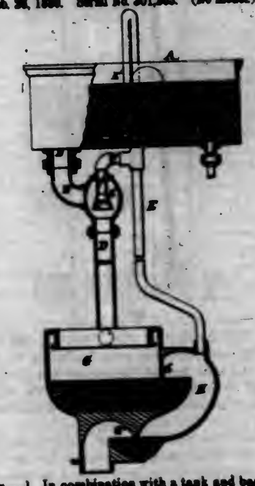
Claim.—The combination of the horizontal or nearly horizontal fire-bars of a furnace and the bridge, with a perforated hearth-slab or grating between the inner ends of the fire-bars and the bridge, and having central trunnions, upon which it is mounted, with a longitudinal spindle fitted to the square end of one of the trunnions and extending out beyond the front of the boiler and having there a clamp by which the spindle may be turned.

411,085. PILE FABRIC. William H. Ramsden, Bridgenorth, County of Salop, England. Filed Nov. 22, 1887. Serial No. 256,206. (No model.)

Claim.—As an article of manufacture, a cut pile fabric having pattern-warps forming the pile, of which only one-half or less are at any time buried in the back or ground of the fabric, the remaining portion where they appear in the fabric being merely bound therein by weft-threads, and weft-threads, filling-threads at the back of the fabric, and ground-chains which bind the pile warp, filling-threads, and wefts in the body of the fabric, all substantially as described.

411,086. SELF-LOCKING DIFFERENTIAL HOIST. Charles F. Batt, Brooklyn, N. Y. Filed June 27, 1888. Serial No. 315,801. (No model.)

Claim.—1. A differential pulley-block having a wheel with two turns of the rope passing over the wheel, one on top of the other, and gripping devices to grip the outer turn and lock the pulley under the weight of the load, all substantially as described.



2. A differential pulley-block having a wheel with two turns of the rope passing over the wheel, one on top of the other, and gripping-levers carried by the wheel, to be acted on by the inner turn of rope to grip the outer turn, all substantially as described.

3. A differential pulley-block having a wheel with a single deep groove, two turns of rope passing over the wheel, one on top of the other in this groove, and gripping-levers pivoted in notches in the flanges of the grooved wheel, to be acted on by the inner turn of the rope to grip the outer turn, all substantially as described.

4. A differential pulley-block having a wheel, two turns of rope passing over the wheel, one on top of the other, and gripping-levers on opposite sides of the rope, to be acted on by the inner turn to grip the outer turn, all substantially as described.

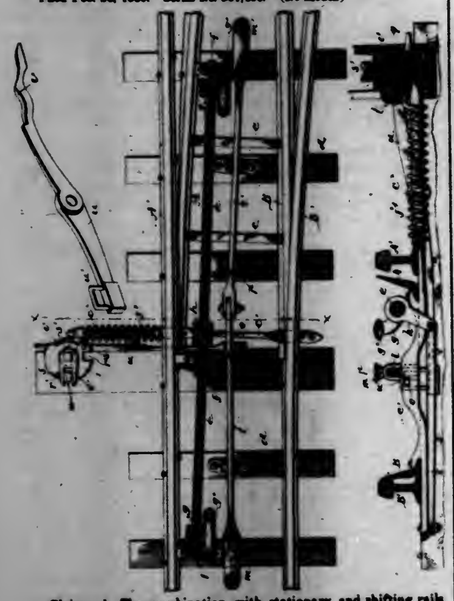
5. A differential pulley-block having a wheel, two turns of rope passing over the wheel, one on top of the other, and pairs of gripping-levers to be acted on by the inner turn to grip the outer turn, the two levers of each pair being on opposite sides of the rope and out of line with each other, all substantially as described.

411,087. WATER-CLOSET. Albert F. Bleser, Columbus, Ohio. Filed Feb. 26, 1889. Serial No. 301,363. (No model.)

Claim.—1. In combination with a tank and basin having a cham-

ber H, a chamber C in the long leg B of the flushing-siphon, a bent air-pipe E E', extending upward and then bent downward, so as to connect chamber H and the water in the tank above the minimum level, and a connecting-pipe F F', extending laterally from E into the interior of chamber C and opening downward, substantially as set forth.

2. In combination with a tank and basin having a chamber H, a chamber C in the long leg B of the flushing-siphon, a bent air-pipe E E', extending upward and then bent downward, so as to connect chamber H and the water in the tank above the minimum level, and a connecting-pipe F F', extending laterally from E into the interior of chamber C and opening downward, terminating in a bell-mouth, substantially as set forth.



3. In combination with a tank and siphon and basin having a chamber H, a chamber C in the flushing water-passage, a pipe E E', terminating slightly above the level of the mouth of the short leg of the siphon, and a connecting-pipe F F', terminating in the downwardly-opening bell-mouth F² in the chamber C, substantially as set forth.

411,088. ARC LAMP. FREDERICK R. BOARDMAN, London, County of Surrey, England, assignor of one-half to Bernst Carl Wilhelm Peterson and Mads Peter Hardt, same place. Filed Aug. 14, 1888. Serial No. 282,751. (No model.)

Claim.—In an arc lamp, the combination of one or more solenoids, each having a core attached to a vertical rack-bar, a marble block with an aperture therethrough, two electrodes in connection with said block, one of which is movable, a horizontal rack-bar attached to said movable electrode, a pinion with which the rack-bars engage, and the circuits and connections, substantially as described.

411,089. RAILWAY-SWITCH. ARCH BOUGHER, Mooclova, Ohio. Filed Feb. 23, 1889. Serial No. 301,490. (No model.)

Claim.—1. The combination, with stationary and shifting rails, of a double-acting spring-actuated latch for locking the shifting rails in one position, said latch having shoes on its outer ends, and means for engaging said shoes, whereby the latch is raised and the shifting rails are allowed to assume their normal position, substantially as set forth.

2. The combination, with stationary and shifting rails and tie-rods connecting the latter, one of said tie-rods having a notch or recess therein, of a double-acting latch located between and parallel with the tracks in position to be actuated by a car and normally bearing upon said tie-rod and adapted to enter the notch when the latter is in position beneath the latch, substantially as set forth.

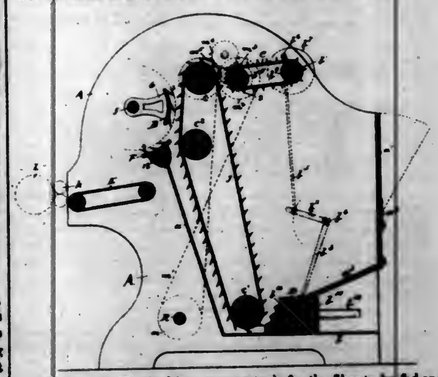
3. The combination, with stationary and shifting rails and tie-rods connecting the latter, one of said tie-rods having a notch or recess therein, of a pair of spring-actuated pivoted levers comprising a double-acting latch, one of said levers being adapted to drop into the notch when the latter comes beneath the latch, substantially as set forth.

4. The combination, with stationary and shifting rails and tie-rods, of a latch for engaging one of said tie-rods, a rock-shaft connected with one of the tie-rods, and treadles on the rock-shaft, whereby the latter is rocked, substantially as set forth.

5. The combination, with stationary and shifting rails and tie-rods connecting the latter, one of said rods having a notch or recess in its upper edge and a bearing-surface beneath the stationary rails, of a rock-shaft, treadles, a lug projecting from the shaft, a pitman connecting the outer end of said lug with the tie-rod, and a latch for engaging the latter, substantially as set forth.

6. The combination, with stationary and shifting rails, treadles whereby the switch may be operated from a passing train, and a latch for holding the rails in position, of means whereby the switch is shifted and locked by hand, and a lever operated by the shifting device and adapted to remove the latch which holds the shifting rails, substantially as set forth.

7. The combination, with stationary and shifting rails, tie-rods connecting the latter, and a latch for locking the tie-rods, of a pivoted lever adapted to engage the latch at one end and having a curved bearing-surface at the other end, and devices for engaging the curved end of the arm to raise the latch, substantially as set forth.



8. The combination, with stationary and shifting rails, a notched tie-rod, and a latch, of a switch-stand, a turning post thereon, said post having a bearing-arm thereon, and a latch-operating lever having a curved bearing-surface at one end in position to be depressed by the contact therewith of the bearing-arm, whereby the opposite end is raised and the latch is removed from the notch in the tie-rod, substantially as set forth.

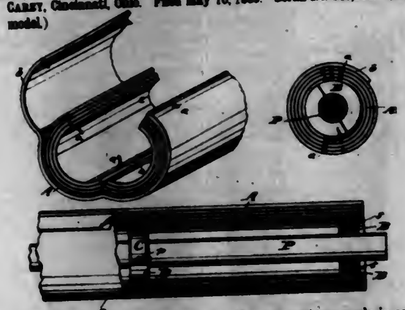
9. The combination, with stationary and shifting rails, a notched tie-rod, and a double-acting spring-actuated latch, said tie-rod having a yielding extension and a spiral spring thereon, of a switch-stand having a notched plate on its top, a turning post, a locking device thereon, a bearing-arm on its lower end, secured to one end of the spring, and a lever extending transversely beneath the rail with one end beneath the latch and the other end beneath the bearing-arm, said latter portion having a rounded surface, substantially as set forth.

10. The combination, with stationary and shifting rails, a latch, rock-shaft, and means for operating said shaft and latch, of a switch-stand, a turn-post, a handle for locking the latter, and a bearing-arm on the post, a lever extending beneath the rails, with one end under the latch and the other in position to be engaged by the bearing-arm on the turn-post, substantially as set forth.

411,090. FEEDING MECHANISM FOR MACHINES FOR TREATING WOOL. WILLIAM C. BRAMWELL, Hyde Park, Mass. Filed June 23, 1887. Serial No. 242,708. (No model.)

Brief.—The machine is specially designed to feed long-fibered wool in fleece form, or after the wool has been once washed.

Claim.—1. The feed box or receptacle for the fiber to be fed and the toothed elevating-apron therein, combined with a horizontally-reciprocating pusher located at the bottom of the said feed box or receptacle, and with means for actuating the said pusher to cause it to act upon the said fiber at the bottom of the said receptacle and impale it upon the teeth of the said elevating-apron, substantially as set forth.



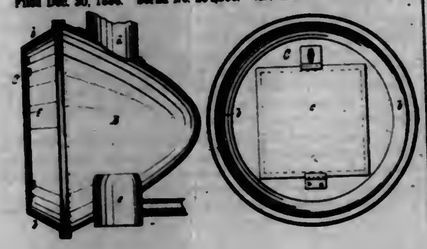
2. A receptacle for the wool or other fiber to be fed, a toothed elevating-surface therein, and a reciprocating pusher, combined with a comber or evener composed of a toothed apron to co-operate with the said elevating-surface, substantially as described.

3. A receptacle for the wool or other fiber to be fed, a toothed lifting-surface therein, a reciprocating pusher, and an apron comber or evener, substantially as described, combined with a segmental clearer or stripper located at the rear side of the toothed elevating-surface, and with a fixed holder, to operate substantially as described.

4. A receptacle for fiber and an elevating-apron therein having needle-pointed teeth, and the vibrating stripper located at the rear side of the said elevating-apron and having two or more rows of substantially straight needle-pointed teeth, substantially as described, set dodging, combined with a holder also located at the rear side of the said elevating-apron and having two or more rows of needle-pointed teeth, the motion of said stripper being of such extent, substantially as described, as to enable the stripper to strip the teeth of the elevating-apron and of the said holder, and to be in turn cleared by the holder, substantially as set forth.

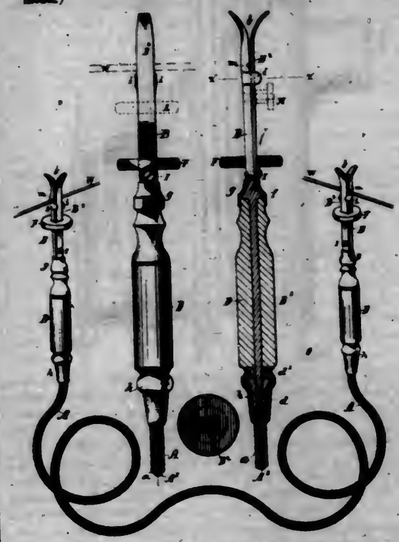
5. A receptacle for the fiber and an elevating-apron therein having needle-pointed teeth, and a vibrating stripper located at the rear side of the said elevating-apron and having two or more rows of needle-pointed teeth set dodging, combined with a holder also located at the rear side of the said elevating-apron and having two or more rows of needle-pointed teeth, the motion of the stripper being of such extent, substantially as described, as to enable it to clear the teeth in the elevating-apron and the teeth in the holder, the teeth of the said stripper being in turn cleared by the holder, and with a reciprocating pusher, and means to move it intermittingly to impale the fiber at the bottom of the mass in the said receptacle upon the teeth of the said elevating-apron, substantially as set forth.

411,091. COVERING FOR STEAM PIPES OR BOILERS. PHILIP CAREY, Cincinnati, Ohio. Filed May 10, 1889. Serial No. 310,301. (No model.)



Claim.—1. A removable covering for steam-pipes, made in sections and composed of a continuous roll of flexible material coated on one or both sides with magnesia, fossil-meal, slaked lime, or other pulpy fire-proof composition, and partially bisected, substantially as and for the purpose described.

2. In a removable covering for steam-pipes, the combination, with a fire-proof coated flexible material rolled into layers, of pegs or nails inserted therein to bind the layers together, in the manner and for the purpose specified.



3. In a removable covering for steam-pipes, the combination, with a flexible fire-proof material rolled into layers, of composition rings formed in semi-cylindrical parts strengthened and hinged by wire or other flexible material embedded in the same, substantially as and for the purpose described.

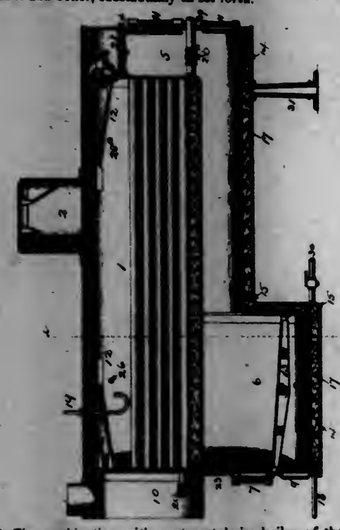
411,092. MAGIC LANTERN. JAMES R. COLT, New York, N. Y. Filed Dec. 20, 1888. Serial No. 294,200. (No model.)

Claim.—The combination of the lamp, the parabolic reflector having the chimney *d* secured to one side and a burner-case to the opposite side, and the hood C, having the window *c*, the burner of the lamp being received within the burner-case, by which the reflector is supported, and the reflector and hood constituting the combustion-chamber, substantially as and for the purpose described.

411,093. INSTRUMENT FOR CONNECTING LINE-WIRES. WILLIAM H. CORBLIN, Worcester, Mass., assignor of one-half to Herbert H. Fairbanks, same place. Filed Apr. 10, 1889. Serial No. 306,907. (No model.)

Claim.—1. An instrument for the purpose specified comprising a flexible conductor provided at each of its respective ends with a metal bar having a transverse notch or recess near its end for the reception of the line-wire of an electric-lighting circuit, and a spring or jaw adapted for pressing the wire into said notch and holding it in connection therewith, substantially as set forth.

2. An instrument for the purpose specified comprising a flexible insulated wire-conductor provided at its two ends with metal bars, each having a seat or notch across its face adapted for receiving and holding the line-wire, in combination with a movable jaw on the side of said bar overlying said seat, and a jaw-clamp for locking the jaw thereon, all substantially as described.



3. In an instrument for the purpose specified, the combination of the flexible conductor, the metal attaching-bars coupled at their shanks to the respective ends of said conductor, and each having a seat or notch for receiving the line-wire, with slide-ears adjacent thereto, the spring-jaw overlying said notch and retained laterally by said ears, the handles of non-conducting material arranged on the shanks of said attaching-bars, and a locking disk or slide for positively clamping the jaws upon the line-wire, substantially as set forth.

4. The combination of the conducting metal bar B, having a notch or seat for holding the wire, and the shank B', shouldered at *f* and threaded at its end, the non-conducting handle D, fixed on the shank of said bar, the jaw *b*, overlying the wire-holding seat, the flexible insulated conductor A, the coupling *d*, connecting said conductor to the end of the bar-shank, the insulating-ferrules *g* and *h*, and the non-conducting sliding disk F, fitted over the bar and jaw for forcing them together, substantially as shown and described.

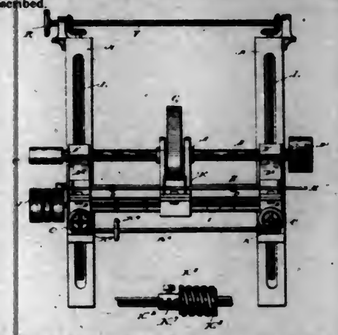
411,094. STEAM-BOILER. JOHN DIRK, Mendville, Pa. Filed Nov 1, 1887. Renewed Mar. 9, 1889. Serial No. 302,762. (No model.)

Claim.—1. The combination, with a return tubular boiler, of a double casing or water-jacket having open ends, a curved lower portion extending the full length of the boiler and combustion-chamber and horizontally across and beneath the fire-box, combustion-chamber, and boiler, and vertically on each side thereof and constituting, respectively, the bottom of the ash-pit, the bridge-wall, and the bottom of the flue, head-plates closing the open-ended water-jacket and open-ended combustion-chamber and provided with doors to permit of ready access being had to said combustion-chamber and boiler-

flues and one or more feed-pipes, and a circulating-pipe connecting the jacket and boiler, substantially as set forth.

2. The combination, with a return tubular boiler, of the double-walled casing or water-jacket herein described, of U form in cross-section, extending from the front of the fire-box to the rear thereof upwardly to form the bridge-wall and thence horizontally to the rear of the combustion-chamber and extending across the bottom and up the sides thereof and constituting the bottom of the furnace-flue, the water-space between the walls of said casing or jacket being closed at the top by a bar or flanged joint, and said casing being removably attached to the boiler by suitable means, as by flanged plates, and suitable supply and circulation pipes connecting said jacket and boiler, substantially as and for the purpose set forth.

3. The combination, with a return tubular boiler, of an open-ended water-jacket of U form in cross-section, within which the boiler is removably set, said jacket extending horizontally across the bottom of the fire-box and vertically upward at the rear thereof to constitute the bridge-wall and thence along the combustion-chamber to the end thereof and forming the bottom of the flue and thence vertically up the sides thereof and also of the boiler, an open-ended combustion-chamber, cast-iron heads closing the open ends, respectively, of said jacket and of the combustion-chamber and provided with suitable doors to permit of ready access to said combustion-chamber and boiler-tubes, and suitable water supply and circulation pipes connected with the boiler and jacket respectively, substantially as set forth.



4. The combination, with a return tubular boiler, of an open-ended combustion-chamber and an open-ended water-jacket of U form in cross-section, within which the boiler is removably set and braced, said jacket surrounding the entire bottom and sides of the fire-box and combustion-chamber, and the sides of the boiler extending the entire length thereof and also constituting the bridge-wall and the flue-bottom, head-plates secured to the respective ends of the jacket to close the water-space therein and also the respective ends of the combustion-chamber, water-supply pipes, and a water-circulating pipe connecting the respective sides of the jacket and the boiler and having a suitable blow-off, substantially as set forth.

411,095. ROLL-GRINDER. PATRICK F. DOOLEY, Malone, N. Y. Filed Dec. 7, 1888. Serial No. 292,941. (No model.)

Claim.—1. The combination, in a roll-grinding machine, of the laterally-movable brackets carrying the shaft and the grinding-wheel, the screws K^3, engaging and adapted to move the brackets, the shaft K^2, and the worm-gears connecting the latter to the screws K^3, whereby the brackets may be operated simultaneously, substantially as described.

2. The roll-grinding machine comprising the vertical standards, the brackets movable vertically thereon, the non-revolable bar H, connecting the brackets, the traversing carriage mounted on said bar, the screw-shaft to operate the carriage, the driving-shaft journaled in the brackets and connected to the screw-shaft to rotate the latter, and the grinding-wheel having its bearings in the carriage and feathered on the driving-shaft, substantially as described.

3. In a roll-grinding machine, the combination of the standards, the brackets movable vertically thereon, the driving-shaft B', mounted on said brackets and having the pulley C', the bar H, connecting the brackets, the carriage traveling on said bar, the sleeve journaled in the carriage and feathered on the driving-shaft, the grinding-wheel secured to the said sleeve, the screw-shaft to operate the carriage, and connections, substantially as specified, between the driving-shaft and screw-shaft, whereby they are operated simultaneously, substantially as described.

4. The combination, in a roll-grinding machine, of the laterally-movable brackets carrying the shaft and the grinding-wheel, the screws K^3, engaging and adapted to move the brackets, the shaft K^2, and the worm-gears connecting the latter to the screws K^3, one of said worm-gears having a set-screw K^4, so that it may be rigidly secured to the shaft or rendered loose thereon, whereby the brackets may be moved simultaneously or independently of each other, substantially as described.

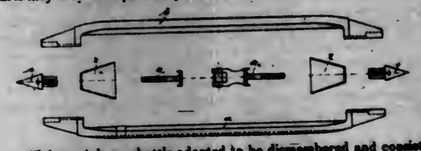
411,096. SHIPPING-CAN FOR PERISHABLE ARTICLES. DAVID H. EATON and AMBROSE C. EATON, Waverly, N. Y. Filed June 14, 1889. Serial No. 314,321. (No model.)

Claim.—1. The combination, with an outer cylinder or jacket provided with a series of vertical corrugations, of an inner receptacle mounted in the jacket and supported out of contact with the walls thereof, substantially as specified.

2. The combination, with the jacket of a shipping-can provided with a series of corrugations, said corrugations extending through its length, forming air-passages, of a vertical collar secured upon the inner surface and at the bottom of the jacket and extending below the same, substantially as specified.

3. In a shipping-case, an outer jacket provided with a series of corrugations disposed from top to bottom, a collar mounted within and at the upper end of the jacket and extending above the same, and a stiffening-collar mounted in the lower end of the jacket within the same and extending below the same, in combination with an inner receptacle having a bead resting on the upper collar depending within the jacket and terminating a short distance above the lower end thereof, substantially as specified.

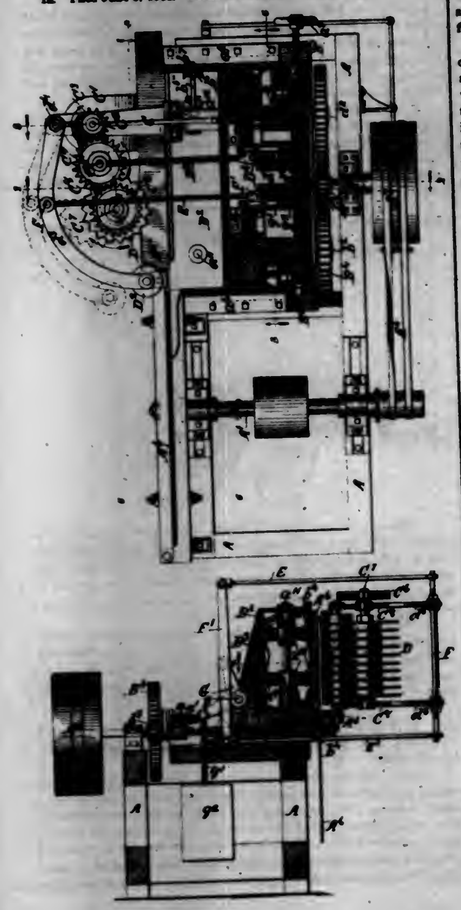
4. A shipping-can the receptable of which is provided with a cover consisting of a disk adapted to enter the receptacle and a superimposed metallic cap having a series of perforations forming an air-chamber, the perforations being so relatively arranged as to form draft-passages, substantially as specified.



5. A shipping-can the inner receptacle of which is provided with a cover consisting of a disk having a superimposed metallic cap perforated and provided with corrugations extending from each perforation to its opposite perforation, substantially as specified.

6. In a shipping-case, the combination, with an outer jacket

formed of sheet metal, wood, or other material and corrugated from top to bottom, a collar arranged in the upper end of the same and projecting above the jacket, and a collar arranged in the lower end and projecting below the same, of a can or receptacle arranged within the jacket and provided with a cover having an annular flange and a superimposed air-chamber, and pliable cover-fastening clips inserted between the upper edge of the jacket and its upper collar and adapted to turn over the bead of the cover, substantially as specified.



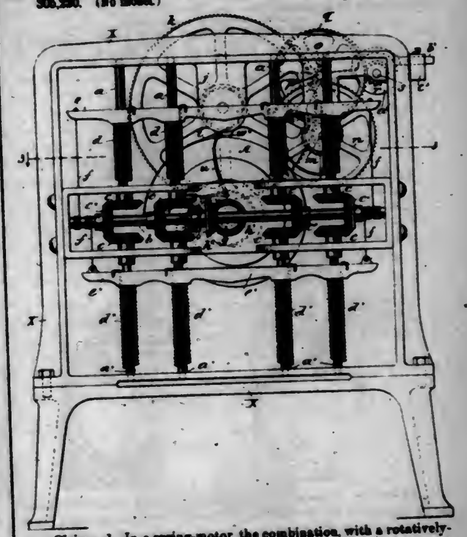
411,097. LOOM-SHUTTLE. JULIUS ISAAC and EBERHARD WERNER-BURGER, Cannstadt, Wurtemburg, Germany. Filed June 18, 1888. Serial No. 314,570. (No model.)

Brief.—In case of the breakage or wearing out of any of the parts they may be replaced by others.

Claim.—A loom-shuttle adapted to be dismembered and consisting of two longitudinal pieces *a* and *b*, two holders *z z*, two points *s s*, with inner screw-thread, two screw-threaded cramps $b' b^2$, the latter of which serves as spindle-support, and the spindle *c*, substantially as and for the purpose set forth.

411,098. RESAWING-MACHINE. ROBERT FISHER, Chicago, Ill. Filed June 5, 1888. Serial No. 276,066. (No model.)

Claim.—1. In a resawing-machine, the combination, with the main frame, of the carriage-box frame adjustably mounted thereon and provided with the lower angular edges a^4 a^4, the angle bed-plates a^5 a^5, the cap-plates a^6 a^6, the screw-shafts having a threaded engagement with the under side of said box-frame, the pinions mounted on said screw-shafts, the hand operating-shaft, and the pinions mounted thereon and which engage with the companion pinions on the screw-shafts, substantially as and for the purpose set forth.



2. In a resawing-machine, the combination, with the main frame, of the adjustable carriage-box frame mounted thereon, the vertical shafts a^{11} a^{12}, journaled thereon, the sprocket-pulleys mounted on said shafts, the lag feed-chain carried by said pulleys, the pinion *b*, mounted on the lower end of the shaft a^{11}, the pinion b', the horizontal shaft b^2, the gear-wheel B^4, the pinion b^3, and the counter-shaft A^2, substantially as and for the purpose set forth.

3. In a resawing-machine, the combination, with the rotating toothed feed-roller arranged vertically and yielding laterally, of the bifurcated swinging bracket-arm in which said feed-roller is journaled, the lag feed-chain moving in a vertical plane, said toothed roller and feed-chain being located upon and pressing against opposite sides of the material in the line of the saw, and the carrying-shafts upon which said lag-chain is mounted, substantially as and for the purpose set forth.

4. In a resawing-machine, the combination of the lag feed-chain consisting of a number of rectangular plates arranged vertically and hinged together, as described, the vertical shafts and sprocket-wheels upon which said lag-feed is mounted, the toothed feed-roller, the laterally-swinging bifurcated bracket-arm in which said feed-roller is mounted, the presser-roller located in advance of and on the same side with the feed-roller, the curved swinging arms d^2 d^2, and the stationary shaft upon which the rear ends of said curved arms are pivoted, substantially as and for the purpose set forth.

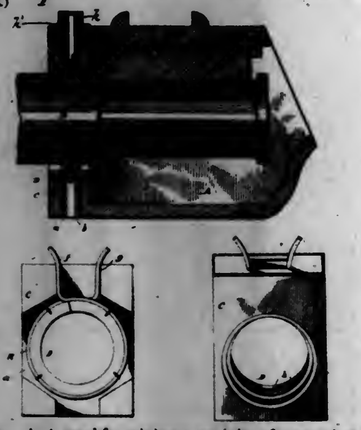
411,099. SPRING-MOTOR. PARKER J. GATES, Darien, Pa., and ROSSMER H. GATES, Brooklyn, N. Y. Filed Mar. 30, 1889. Serial No. 305,290. (No model.)

Claim.—1. In a spring-motor, the combination, with a rotatively-mounted shaft, as *b*, of a rotatively-mounted spring-arbor geared therewith, a helical spring on said arbor and secured at one end thereto, a slide-bar secured to the other end of said spring and adapted to move in a direction parallel to the longitudinal axis of the spring, and a flexible connector attached at one end to said slide-bar and secured at its other end to said shaft *b*, and adapted to wind about

said shaft, as set forth, whereby said spring is caused to exert two forces tending simultaneously to rotate said shaft.

2. In a spring-motor, the combination, with a rotatively-mounted shaft, as *b*, of a rotatively-mounted spring-arbor geared to said shaft *b*, a helical spring on said arbor and secured at one end to the same, a slide-bar secured to the other end of said spring and adapted to move in a direction parallel to the longitudinal axis of the spring, a flexible connector attached at one end to the slide-bar and secured to and winding about the shaft *b* at its other end, the fusee and its shaft geared to the shaft *b*, the drum *j*, the connector *i*, which connects and winds on said fusee and drum, the power-shaft *a*, and the train of gears intermediate between said drum and power-shaft, substantially as set forth.

3. In a spring-motor, the combination, with the shaft *b*, of the rotating spring-arbors *a*, two or more, geared to said shaft *b*, the springs *d* on said arbors, secured at one end to the respective arbors, the bar mounted to slide on the spring-arbors and secured to the springs thereon, and the flexible connectors secured to the respective ends of said slide-bar and winding on the shaft *b*, substantially as set forth.



4. In a spring-motor, the combination, with the spring from which the power is derived, a drum *j*, and a flexible connector winding on said drum, of a fusee driven by said spring and communicating its motion to said drum through said connector, said fusee being in the form of a volute of the character described, and having a pitch which varies with the variations in the angle made by the intermediate portion of the connector *i* with a line which passes through the axes of the fusee and drum, whereby the regulation effected by the fusee is rendered uniform, as set forth.

5. In a spring-motor, the combination, with a drum *j* and a flexible connector *i*, of a fusee A in the form of a volute whereof the pitch varies with the variations in the angle made by the straight intermediate portion of the connector *i* with a line which passes through the axes of said drum and fusee, whereby the regulation effected by the fusee is rendered uniform, as set forth.

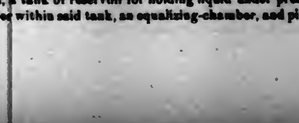
6. In a spring-motor, the combination, with a helical spring from which the power is derived, of a longitudinal tension applier and torsional-tension applier, whereby the spring may be put under longitudinal and torsional tension, for the purpose set forth.

7. In a spring-motor, the combination, with a helical spring from which the power is derived, and the power-shaft, of intermediate mechanism between said spring and power-shaft, whereby the spring is put under longitudinal and torsional tension and reacts under both tensions simultaneously on the power-shaft, said mechanism consisting of a longitudinal-tension applier and a torsional-tension applier, substantially as described.

411,100. DUST-GUARD FOR CAR-AXLE BOXES. CHARLES W. HAYES, Washington, D. C. Filed Jan. 28, 1887. Serial No. 225,904. (No model.)

Claim.—1. A guard for axle-boxes, consisting of a case adapted to be inserted in the guard-recess of the axle-box, and having a recess in which is confined a freely-moving plate, perforated to embrace the axle and form a bearing portion therefor, the said recess being larger than the plate in both vertical and horizontal dimension, and an anti-friction-bearing substance located in the bearing-surface of said plate, substantially as set forth.

2. The combination, in a guard for axle-boxes, of a case adapted to be inserted in the guard-recess of the axle-box and having a recess in which is confined a freely-movable plate, adapted to embrace the axle and vibrate bodily therewith, and comprising an annular section separated at its upper side, an anti-friction-bearing substance located in the bearing portion of said plate, and a spring E, secured to said annular section and having extended ends by which it may be operated, substantially as set forth.

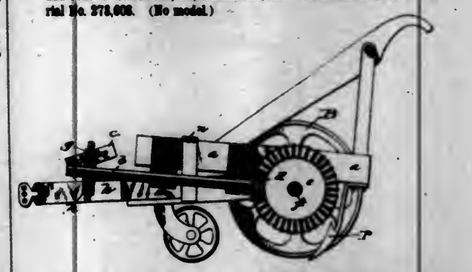


3. The combination, with a car-axle box having a guard-recess, of a guard in said recess and having a portion extending above said box, and a cap adapted to incase the projecting portion of the guard, substantially as set forth.

4. The combination, with a guard for axle-boxes, of a cap therefor, and curved springs *n n*, depending from said cap, substantially as set forth.

5. The combination, with a guard for axle-boxes, said guard having a case proper confining a freely-moving bearing portion, of an outer metallic sheeting for said guard-case, substantially as set forth.

6. The combination, with an axle-box, of a guard therefor having a yielding bearing portion, an operating-spring therefor connected thereto and having extended ends, and a cap or case for said guard adapted to cover the guard and extended ends above the top of the axle-box, substantially as set forth.

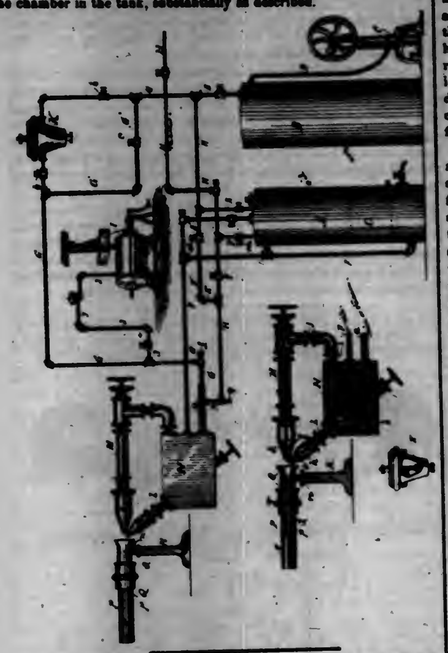


411,101. SUSPENDER-BUCKLE. EDWARD A. HILL, Chicago, Ill. Filed May 13, 1889. Serial No. 310,510. (No model.)

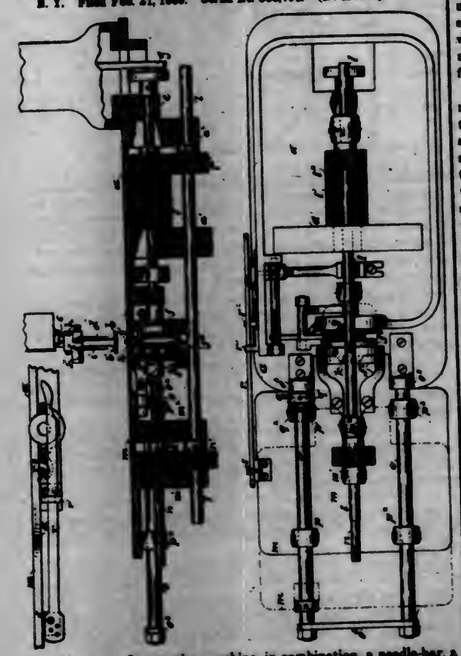
Claim.—1. A suspender-buckle composed of an upper and lower section united by a hinge-joint, the upper section being of sheet metal and provided with a slot and its lower edge armed with teeth, and the lower section formed from wire with a passage for the web and carrying a bearing-plate for the toothed plate to confine the web thereon, substantially as specified.

2. A suspender-buckle composed of an upper and a lower section hinged together, the lower section being formed from wire and provided with a bearing-plate, forming a passage for the web, and the upper section having a slot for the passage of the web and teeth journaled on the upper transverse portion of the lower frame, substantially as specified.

411,102. COTTON-CHOPPING MACHINE. GEORGE E. HUDSLAY and JOHN T. CHAMBERS, Jr., Barnesville, Ga. Filed June 27, 1888. Serial No. 278,603. (No model.)



Claim.—1. In combination, a main frame, a driving-axle, a cutter-shaft supported by the main frame and having geared connections with the axle, a supplemental frame hinged to the main frame, with bearing-wheels for the supplemental frame, whereby the operator by elevating the main frame at its front end may throw the cutters more or less out of work, substantially as described.



2. In combination, a main frame, a cutter-shaft carried thereby, a supplemental frame hinged to the main frame forward of the axle, and stops for limiting the upward movement of the main frame, said stops being connected to the supplemental frame, substantially as described.

411,103. APPARATUS FOR BURNING HYDROCARBON OILS. JOHN B. HULL, Baltimore, Md. Filed June 13, 1888. Serial No. 276,951. (No model.)

Claim.—An atomizer composed of a hydrocarbon-liquid-discharge pipe within a fluid-pressure-equalizing chamber and having a nozzle thereon, a fluid-discharge pipe having a nozzle contiguous and at an angle to the liquid-discharge nozzle for atomizing the liquid, a retort, tube, or burner into which the atomized liquid is directed and burned, a tank or reservoir for holding liquid under pressure, a steam-chamber within said tank, an equalizing-chamber, and pipes for supplying the fluid-discharge pipe and equalizing-chamber with steam from the chamber in the tank, substantially as described.

411,104. MULTIPLE SEWING-MACHINE. FERDINAND KERR, Newark, N. J., assignor of three-fourths to Holmes & Strauss, New York, N. Y. Filed Feb. 21, 1889. Serial No. 300,791. (No model.)

Claim.—1. In a sewing-machine, in combination, a needle-bar, a needle affixed thereto, a second needle affixed thereto, a shuttle-driver and shuttle-race, and means for supporting the same, whereby they are maintained in a fixed position, so that the shuttle controlled thereby shall co-operate with the first needle, a second shuttle-driver and shuttle-race, a carriage, upon which the same are mounted, said carriage having a range of movement to carry the shuttle-driver and shuttle-race from a position to sew in co-operation with the second needle into a position beyond the range of adjustment of the needle without disturbing the fixed position of the needle upon the needle-bar, and connections whereby the first and second shuttle-drivers are actuated from the same prime mover, substantially as described.

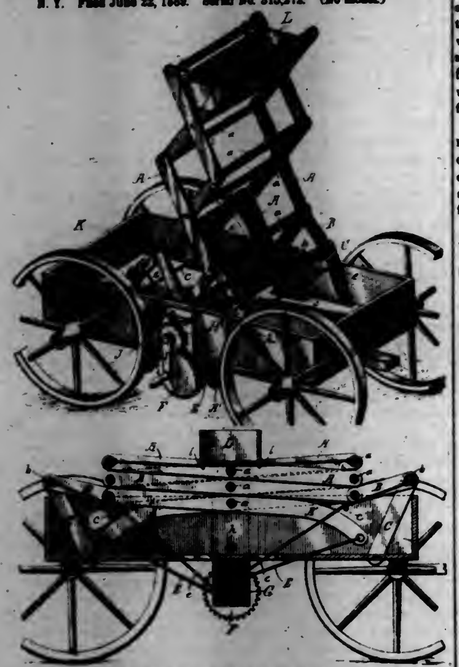
2. In a sewing-machine, in combination, a needle-bar, a needle affixed thereto, a second needle affixed thereto, means whereby the second needle may be affixed thereto at varying distances from the first needle, a shuttle-race fixed upon the frame of the machine in such a position that the shuttle contained therein would co-operate with the first needle, a shuttle-driver for operating said shuttle, a second shuttle-race and shuttle-driver, a carriage upon which the same are mounted, said carriage having a range of movement sufficient to move the shuttle-driver and shuttle-race from position to sew with said second needle into a position beyond the range of adjustment of the needle, means of adjustment whereby the position of said second shuttle-race and shuttle-driver may be adjusted upon said carriage, so that the shuttle belonging thereto may be located to correspond with the position of said second needle upon the needle-bar, and means for actuating said first and second shuttle-drivers from the same prime mover, substantially as described.

3. In a sewing-machine, in combination, two needles, two rotary shuttle-drivers, a shuttle-race for each, said rotary shuttle-drivers being mounted face to face upon the ends of two shafts in alignment with each other, connections whereby one of said shafts and one of said shuttle-races is secured in a fixed position upon the frame of the machine, a carriage upon which the second shaft and shuttle-race are secured, a shaft *l*, extending from the driving mechanism of the first shuttle-driver and in proximity with said second shaft, and mechanical connections whereby said second shaft may be driven for all positions of the carriage, substantially as described.

4. In a sewing-machine, in combination, two needles, a shuttle-race and shuttle-driver arranged to drive a shuttle to co-operate with the first-named needle, a shuttle-race and shuttle-driver arranged to drive a shuttle to co-operate with the second needle, a carriage upon which said second shuttle-race and shuttle-driver are mounted and adapted to move the same from a position to sew with the second needle into a position remote therefrom, a stop whereby the inward motion of said carriage is arrested in each position as to locate the second shuttle properly to sew with the said second needle, a latch whereby said carriage is held against said stop, and connecting mechanism whereby said first and second shuttle-drivers are actuated from the same driving mechanism, substantially as described.

5. In a sewing-machine, in combination, two needles, a shuttle-race and shuttle-driver adapted to drive a shuttle to co-operate with the first needle, a shuttle-race and shuttle-driver adapted to drive a shuttle to co-operate with the second needle, a carriage upon which said second shuttle-race and shuttle-driver are mounted and adapted to carry the same from a position to sew with the said second needle to a position remote therefrom, a stop whereby the inward motion of said carriage is arrested to present the said second shuttle in proper position to sew with the said second needle, a latch whereby said carriage is held against said stop, means of adjustment for said stop, said latch, and said second needle, whereby the distance between the two seams may be varied, and connecting mechanism whereby said first and second shuttle-drivers are actuated from the same prime mover, substantially as described.

411,105. CARD-CYLINDER. CARL R. KRAUSSE, Philadelphia, Pa., administrator of Karl Ludwig Krausse, deceased; said administrator assignor to the Decker Machine Company, of Pennsylvania. Filed Mar. 20, 1889. Serial No. 303,996. (No model.)

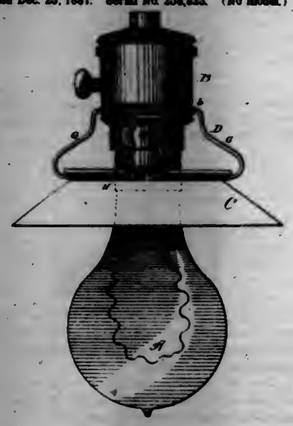


Claim.—1. A card-cylinder having a central shaft, an open metal bracing, and a circumferential wall of plaster-of-paris that is on the outside, on the inside, and passes through the interstices of said metal bracing, substantially as described.

2. A hollow card-cylinder having an outer shell of plaster-of-paris and an inner shaft A, in combination with the disks D D, which close the open ends of said cylinder as specified.

3. A card-cylinder composed of a central shaft A, a set of rings or hoops *b*, carried thereby, and metal bracing *e f*, connecting said hoops or rings, and a plaster-of-paris shell E, which is traversed by said bracing, substantially as herein shown and described.

411,106. FIRE-ESCAPE. ALEXANDER W. LIEBHER, Jamestown, N. Y. Filed June 22, 1889. Serial No. 315,272. (No model.)

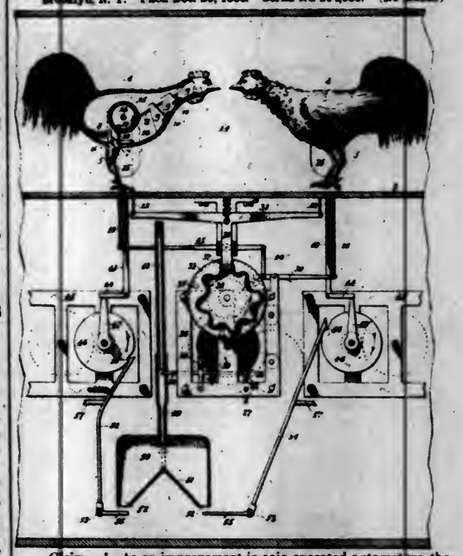


Claim.—1. In a fire-escape, the combination, with the supporting-frame K, lazy-tongs A, and rods *a*, of the braces B C, rods *b*, rods *c*, drum G, spur-wheels F, pinions H, crank-handles I, pawls J, and carriage L, substantially as and for the purposes specified.

2. In a fire-escape, the combination, with the supporting-frame K, lazy-tongs A, rods *a*, ropes E, and drum G, of the braces B C, rods *b*, rods *c*, and ropes *e*, as and for the purposes described.

3. In a fire-escape, the combination, with the supporting-frame K, lazy-tongs A, and rods *a*, of the toggle-jointed braces B C and rods *b* and *c*, as and for the purposes described.

411,107. LAMP-SHADE HOLDER. CHARLES G. PERKINS, Hartford, Conn. Filed Dec. 23, 1887. Serial No. 258,223. (No model.)



Claim.—1. The combination, with a shade-holder for lamps, of a spring-ring for grasping the lamp, a spring-ring for grasping the shade, two fluted or corrugated arms connecting the two rings and located one on each side of the opening in the shade-ring, and a sliding catch, as and for the purpose described.

2. The combination, in a shade-holder for lamps, of two open spring-rings, one adapted to connect with the lamp and the other with the shade, secured together by a plurality of arms or braces, two of which are corrugated, fluted, or notched, and are located on opposite sides of the opening in the ring which supports the shade, the said fluted, corrugated, or notched arms being embraced by a sliding catch, which is adapted to hold the shade-ring closed against its own spring force.

3. The combination, in a shade-holder for lamps, with a spring-ring for grasping the lamp and a spring-ring for grasping the shade, of pairs of fluted arms connecting the two rings, the individuals of each pair being located, respectively, on the opposite sides of the openings between the sections of the shade-ring, and adjustable links for holding the individuals of each pair together, as set forth.

411,108. COIN-OPERATED AUTOMATON. ARTHUR M. PIERCE, Brooklyn, N. Y. Filed Dec. 29, 1888. Serial No. 294,833. (No model.)

Claim.—1. As an improvement in coin-operated automatons, the figures of two cocks in a fighting attitude, a common motor adapted to actuate the necks and legs of both of said cocks, and an independent motor for each cock, one of said independent motors being arbitrarily controlled by the weight of a coin and adapted to move the respective cock to which it is attached.

2. In a coin-operated automaton, two figures having their movable parts connected to a common motor and the bodies each connected with independent motors, each of said motors having a tripping-lever adapted to be actuated by the weight of a coin.

3. As an improvement in coin-operated automatons, the figures of two cocks in a fighting attitude, the necks of said figures being articulated, as shown and described, and provided with connections to a common motor.

4. As an improvement in coin-operated automatons, the figures of two cocks in a fighting attitude, the legs of said figures being articulated and having connections to a common operating-motor independent of the other movable parts of the figures.

5. As an improvement in coin-operated automatons, the figures of two cocks in a fighting attitude, the movable legs and necks of said figures having independently-operating connections to a common motor.

6. The combination, with the two articulated figures, each provided with an independent motor, of a coin-chute having branches leading to the tripping-lever of said independent motors, and a tripping-lever beneath each of said branches and adapted to control the movements of said independent motors, substantially as shown and described.

7. The combination, with the articulated figures, each connected with a common motor and each provided with an independent motor, of a coin-chute terminating in branches leading to the tripping-levers of said independent motors, and the tripping-levers, substantially as shown and described.

8. The combination of the coin-chute, the tripping-lever connected with the common motor, the branches below said chute and the tripping-levers, and the independent motors beneath said branches, substantially as set forth.

9. A coin-operated automaton in which are comprised two articulated figures, each movably supported on independent horizontal pivots connected with independent motors.

10. A coin-operated automaton in which are comprised two articulated figures, the movable parts of said figures having connection with a common motor, a movable supporting-pivot for each figure having connection with an independent motor, a coin-chute, a lever controlling the common motor branches of said coin-chute, and levers controlling the independent motors and arranged beneath each of said branch coin-chutes, substantially as shown and described.

11. The combination, with the two figures having their necks and legs articulated, as set forth, of a common actuating-motor having connection with the figures, a coin-chute, and a tripping-lever adjacent to said coin-chute and adapted to operate by the weight of a coin.

12. In a coin-operated automaton, the combination, with the actuating-motor, of a figure having a neck composed of a series of blocks hinged to each other and a cord passing from the head through said hinged blocks and connecting with the coin-actuated motor.

13. In a coin-operated automaton representing cocks in a fighting attitude, the combination, with the legs pivoted to the body and normally held in a vertical position by a spring, of connections between the legs and the coin-actuated motor.

14. In a coin-operated automaton, the combination, with the coin-controlled motor, of a vertically-movable yoke having connections with said motor, a horizontal shaft carried by said yoke, and a tube mounted upon said shaft supporting the figure.

15. In a coin-operated automaton of the character herein specified, the combination, with the horizontal shaft, of the tube journaled upon said shaft, the figure fixed to said tube, and the pulleys over which the cords connected to the movable parts of the figure and with the coin-actuated motor pass, pivoted in said tube, substantially as shown and described.

16. In a coin-operated automaton of the character herein specified, the combination, with the figure having an articulated neck and a cord passing therefrom, of an arm fixed to a vertically-movable bar bearing a pin engaging with a cam-wheel upon the coin-controlled actuating-motor, said cord being attached to the movable bar, substantially as shown and described.

17. In a coin-operated automaton of the character herein specified, the combination, with a wheel upon the coin-actuated motor, provided on one side with a stud, of a vertically-movable lever against which said stud is adapted to strike and connections between said lever and the pivoted legs of the figure.

18. In a coin-operated automaton of the character herein specified, the combination, with the coin-actuated motor bearing a wheel having a cam upon one side and a stud or studs upon the other, of connections to the articulated legs and necks of the two figures adapted to be alternately actuated by the rotation of said wheel upon the coin-controlled motor.

19. The combination, with the coin-chute, of the horizontal lever projecting into said chute and provided with two fingers, one of which is adapted and arranged to enter a notch in a disk upon the motor with which said lever is connected and the other to engage with the fly of the motor, substantially as shown and described.

20. The combination, with the fixed coin-chute having a slidable portion, of a tripping-lever projecting into the slidable portion and controlling the movement of a motor, substantially as shown and described.

21. The combination, with the fixed coin-chute having a slidable portion, of the receptacle into which the slidable portion projects, substantially as shown and described.

22. The combination, with the fixed coin-chute having a slidable portion, of the receptacle beneath said chutes having a A-shaped bottom and independent branch chutes, substantially as shown and described.

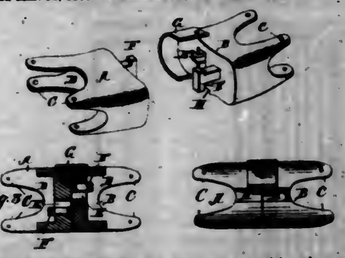
23. The combination, with the fixed coin-chute having a slidable portion entering a receptacle provided with a A-shaped bottom and branch chutes, of the levers projecting beneath said branch chutes and controlling the movements of independent motors, substantially as shown and described.

24. In a coin-operated automaton of the character herein specified, the combination, with coin-controlled actuating-motor, the yoke supporting the horizontal shaft, rotatable tube, and figure, of the slotted partition between said yoke and figure and the slide over said slot, substantially as shown and described.

25. In a coin-operated automaton of the character herein specified, the combination, with the coin-controlled actuating-motor and the slidable yoke bearing the horizontal shaft, of the rotatable tube mounted upon said shaft and supporting the figure and provided with a toothed wheel, and the rack with which the teeth of said wheel mesh, substantially as shown and described.

26. In a coin-operated automaton of the character herein specified, the combination, with the slidable yoke bearing the horizontal shaft supporting the movable figure, of the downwardly-projecting stem of said yoke, terminating in a horizontal foot, and the arm upon the motor adapted and arranged to engage with said foot, substantially as shown and described.

411,109. MECHANISM FOR THE MANUFACTURE OF TUBES. JAMES ROBERTSON, Glasgow, County of Lanark, Scotland. Filed July 7, 1887. Serial No. 243,617. (No model.) Patented in England Nov. 20, 1884, No. 15,752; in Germany Sept. 17, 1885, No. 36,814; in France Sept. 22, 1885, No. 171,280; in Belgium Sept. 22, 1885, No. 70,262, and in Italy Aug. 30, 1886, No. 20,262.



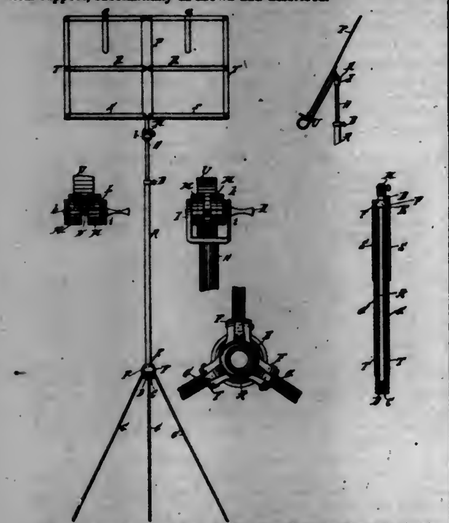
Claim.—1. The herein-described mechanism for forming tubes, comprising long holding-dies for firmly grasping the metal to be operated on, in combination with a rotating mandrel for piercing the metal as it is held in the dies, and means, substantially as described, for applying end pressure to force the mandrel into the metal, all substantially as set forth.

2. The herein-described rotary mandrel for forming tubes by piercing billets, said mandrel having grooves with rounded acting edges to displace the metal as the mandrel is rotated and forced into the billet, substantially as specified.

3. The combination of a rotating grooved mandrel having rounded acting edges for forming tubes by piercing billets of metal with long holding-dies for firmly grasping the metal to be operated on, and means, substantially as set forth, for applying end pressure to force the mandrel into the metal, all substantially as described.

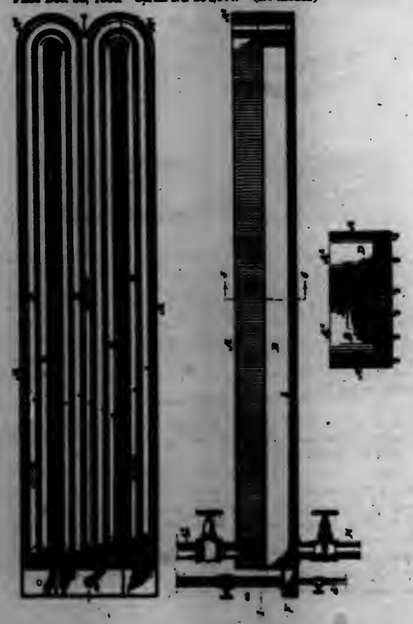
4. The combination of a rotating mandrel for forming tubes by piercing billets of metal with a pair of long half-dies for firmly grasping the metal to be operated on, and a ram to force the dies with the billet up to the rotating mandrel, all substantially as described.

411,110. HORSE-COLLAR FASTENER. JOHN T. ROUNDTREE, New Hampton, Mo., assignor of one-half to J. W. Coulter and R. H. Grantham. Filed Mar. 30, 1889. Serial No. 305,961. (No model.)



Claim.—A collar coupling or fastening comprising the two parts or sections adapted to be attached to the ends of a divided horse-collar, the meeting face of each section being provided with a T-shaped slot and a projecting T-shaped lug adapted to engage the lug and slot of the opposing section, said parts or sections being provided on their under sides with grooves to form a seat for the hame-strap, and one of said sections being provided with a shield extending laterally from its rear edge, so as to cover the joint between the two sections, substantially as set forth.

411,111. MUSIC-STAND. AUGUSTUS W. SIBLEY, Stamford, Conn., assignor of one-half to John H. Christie, same place. Filed Feb. 9, 1889. Serial No. 299,303. (No model.)

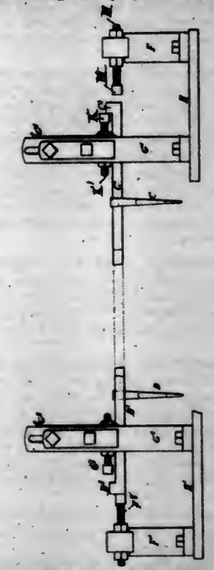


Claim.—1. In a music-stand, the combination, with the music-rest, of a strap secured at one end to the back thereof, passing to the bottom of the music-rest and bending back upon itself, forming a loop, where it is again secured to the music-rest, said strap being movably connected to a clamp mounted upon a vertical support and consisting of two notched disks, through which the strap passes, the disks being perforated for the reception of a supporting and holding screw, substantially as shown and described.

2. The combination, with the strap secured to the music-rest, of the slotted disks embracing said strap, and the thumb-screw passing through said disks, and the supporting-yoke mounted upon the vertical support, substantially as shown and described.

3. A music-stand consisting of a central supporting-tube having a runner thereon, to which the legs are adjustably pivoted, and carrying at one extremity an adjustable vertical support bearing a clamp consisting of two notched disks provided with an adjusting-screw, in combination with a music-rest, the sides or wings whereof are adapted to swing parallel to the center bar of the rest, said rest being connected to the adjustable notched disks by a strap secured to the back of the center bar, passing to the bottom of the rest and bending back upon itself, forming a loop, the whole arranged to fold together, substantially as shown and described.

411,112. DEFECATING-PAN. MARCUS DUNBAR, Fort Scott, Kans. Filed Dec. 28, 1888. Serial No. 294,677. (No model.)



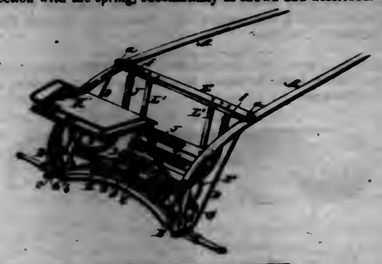
Claim.—1. The combination of the pan having longitudinal partitions therein dividing the pan into opposite side channels and a central channel communicating with each other at one end of the pan, but closed at the opposite end of the same, with heating-pipes in said channels, juice-supply pipes communicating with the closed ends of the side channels, and a juice-discharge pipe communicating with the closed end of the central channel, substantially as specified.

2. The combination of the pan having partitions forming opposite side channels and a central channel communicating with each other at one end of the pan, but closed at the opposite end of the pan, with pipes for supplying juice to the closed ends of the side channels, a pipe for discharging the juice from the closed end of the central channel, heating-pipes located in said channels, a steam-supplying box for said pipes at the closed end of the central channel, and discharge-boxes at the closed ends of the side channels, whereby the steam in the heating-pipes and the juice in the pan are caused to travel in opposite courses, substantially as specified.

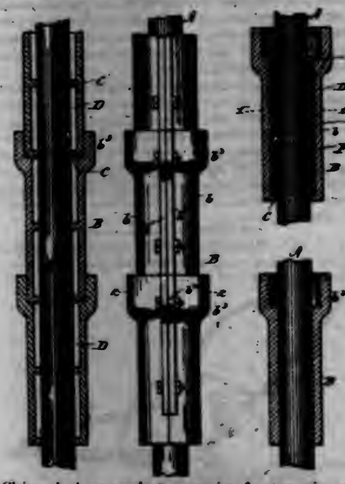
3. The combination of the outer casing of the pan with the longitudinal partitions therein less in height than the outer casing, and forming within the pan opposite side channels and a central channel communicating with each other at one end of the pan, but closed at the opposite end of the same, heating-pipes in said channels, pipes supplying juice to the closed ends of the side channels, and a pipe for discharging the juice from the closed end of the central channel, substantially as specified.

4. The combination of the pan having one end in the form of a pair of segments meeting at or about the longitudinal center of the pan, with longitudinal partitions forming in the pan opposite side channels and a central channel communicating with each other at the segment end of the pan, but closed at the opposite end of the pan, juice-supply and discharge pipes, and heating-pipes in the channels, substantially as specified.

411,113. STRAIGHT-KNITTING MACHINE. GEORGE TOMPLEMAN, Nottingham, England. Filed Dec. 28, 1888. Serial No. 294,677. (No model.) Patented in England May 26, 1887, No. 7,538, and May 3, 1888, No. 6,690.



Claim.—1. In combination with the narrowing-slide H, its bracket G', mounted thereon, the slide G, carrying the supplemental stop K and mounted on such bracket, the bracket F and its adjustable stop, and the splicing-thread-carrier bar having at its end the catch-knob D^3, all substantially as and for the purposes set forth.



2. In combination with slide H, its bracket G', slide G, stop K, bracket F and its adjustable stop, and the splicing-thread carrier having a catch-knob D^3, the slide H', bracket G^4, the slide mounted thereon and carrying an adjustable stop, and bracket F' and its adjustable stop, and splicing-thread-carrier bar D', having a catch-knob D^3 at its end, the combination being and operating substantially as set forth.

411,114. ROAD-CART. JOSEPH W. VORWICK, Monmouth, Ill. Filed June 20, 1888. Serial No. 316,695. (No model.)

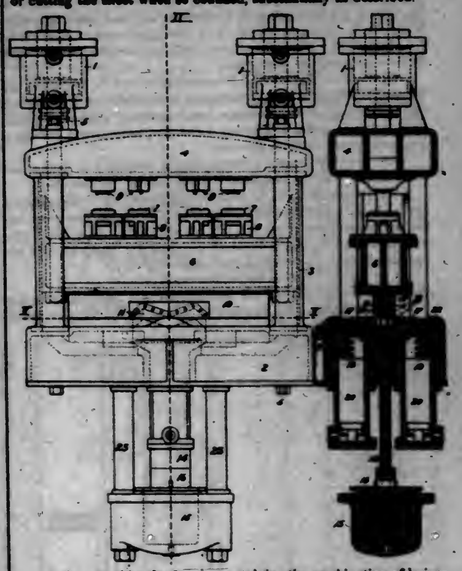
Claim.—The combination, with the thills and axle, of the loops attached to the thills, the spring-shackles formed with spring-loops loosely hang on said loops, the transverse spring hang on the shackles, the head-block secured centrally to the spring, the seat-bars pivotally connected with the thills at their forward ends, the horizontal arms c on the head-block and attached to the seat-bars, and the seat-bar connection with the spring, substantially as shown and described.

411,115. PIPE-COVERING. ISAAC P. WISTAR, Philadelphia, Pa. Filed Oct. 2, 1888. Serial No. 286,974. (No model.)

Claim.—1. A non-conductor covering for steam-pipes or analogous fixtures, composed of semi-cylindrical sections or shells having a bell-mouth at one end and edge flanges, and bolt-and-nut connections passing through said edge flanges, substantially as set forth.

2. A non-conductor covering for steam-pipes or analogous fixtures, consisting of semi-cylindrical sections or shells having at one end a bell-mouth and composed of asbestos and an indurating material as a base, substantially as set forth.

3. A non-conductor covering for steam-pipes and analogous fixtures, consisting of rigid semi-cylindrical sections or shells having at one end a bell-mouth and lugs or ribs C in their bore, and composed of asbestos and an indurating material as a base, substantially as set forth.



4. The rigid semi-cylindrical sections or shells b, having at one end a bell-mouth, lugs C in their bore, and a filling of loose asbestos between said lugs and said sections, consisting of asbestos and an indurating material as a base, substantially as and for the purpose set forth.

411,116. MACHINE FOR SHAPING SHEET METAL. HENRY AIKEN, Homestead, Pa. Filed May 11, 1889. Serial No. 310,426. (No model.)

Claim.—1. In a machine for shaping metal plates or sheets, a reciprocating plunger having on one side cutting-dies and on the opposite side bending and shaping dies, substantially as described.

2. The combination of the bed-plate, the entablature, and the head which reciprocates between the same, said head having on one side cutting-dies and on the opposite side bending and shaping dies, substantially as described.

3. The combination, with the knife-head and bed-plate or anvil adapted to clamp between them a metal sheet, of a knife for shearing or cutting the sheet when so confined, substantially as described.

4. In a machine for forming metal ties, the combination of knives arranged and adapted to cut in a metal plate slots *b* and a cutting and bending tool adapted to cut slits extending between and beyond the slots, thereby cutting out a piece of the metal, and to bend up lips *c* on the outer side of the slots, substantially as described.

5. The combination of the knife-head 10 and the bed-plate or anvil adapted to hold an interposed metal sheet, with a knife which moves through said bed-plate and cuts the sheet in conjunction with the knife-head 10, substantially as described.

6. The combination, with the knife-head 10, of straight-edged blades 11, secured thereto, said knife-head having an intermediate cavity, and a moving knife adapted to enter said cavity and in conjunction with the blades 11 to shear and shape an interposed metal sheet, substantially as described.

7. The combination, with the knife-head 10, of straight-edged blades 11, secured thereto, said knife-head having an intermediate cavity, and a moving knife adapted to enter said cavity and in conjunction with the blades 11 to shear and shape an interposed metal sheet, the face of said moving knife being shaped to conform to the base of said cavity, substantially as described.

8. The combination, with the knife-head 10, of straight-edged blades 11, secured thereto, said knife-head having an intermediate double-angled cavity, and a moving knife adapted to enter said cavity and in conjunction with the blades 11 to shear and shape an interposed metal sheet, substantially as described.

9. The knife-head 10, having opposite knife-blades 11 and an intermediate slot *c*, for containing the heads of bolts which secure said knife-blades in position, substantially as described.

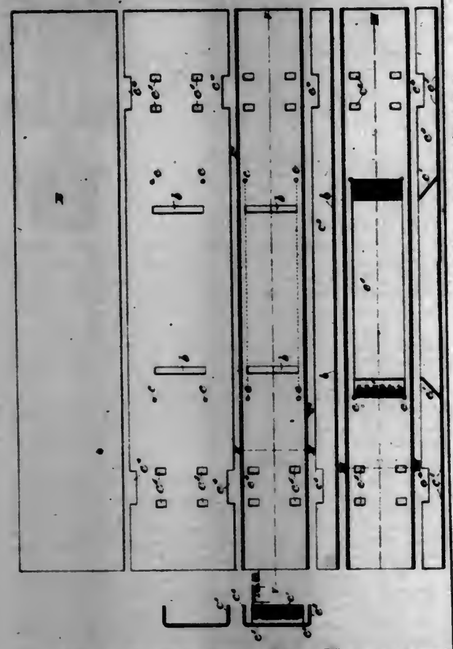
10. The combination, with clamping mechanism for holding an interposed metal sheet, of lateral bending-sectors and racks for operating the same, substantially as described.

11. The combination, with clamping mechanism for holding an interposed metal sheet, of lateral bending-sectors and racks for operating the same, said racks being situated at the middle portions of the sectors, substantially as described.

12. The combination, with clamping mechanism for holding an interposed metal sheet, of lateral bending-sectors and racks for operating the same, and a hydraulic cylinder whose plungers are connected with the racks, substantially as described.

13. The combination, with clamping mechanism for holding an interposed metal sheet, of lateral bending-sectors and racks for operating the same, and the machine bed-plate or frame which backs and braces said racks and takes up the thrust thereof, substantially as described.

14. The combination, with the knife-head and bed-plate or anvil adapted to clamp between them a metal sheet, of a knife for shearing or cutting the sheet when so confined and a hydraulic motor whose plunger operates said knife-head, substantially as described.



15. The combination of the bed-plate or anvil, the moving head adapted to clamp a metal sheet thereon, bending-sectors journaled at the sides of the bed-plate and adapted to bend the projecting edges of the metal sheet, mechanism for operating said sectors, and a moving knife which works through the bed-plate and engages the metal sheet, substantially as described.

16. The moving knife 13, in combination with its knife-head 14, the machine-frame having a passage or opening for the movement of the knife-head, and a bed-plate or anvil consisting of a metal casting fixed to the bed-plate and having a slot or opening for the passage of the knife, substantially as described.

17. The knife-head 14, having lateral shoulders at the end and knife-blades 13 set on said shoulders, substantially as described.

18. The combination of the machine-frame, the bending-sectors, hydraulic cylinders secured to the under side of machine-frame and having plungers connected with and operating said sectors, and a moving knife; and a hydraulic motor whose plunger is connected with and operates the same, substantially as described.

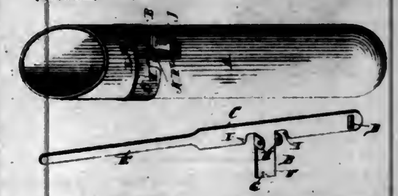
411,117. METHOD OF MAKING METAL TIES. HENRY AIKEN, Homestead, Pa. Filed May 20, 1889. Serial No. 312,043. (No model.)

Claim.—1. The method hereinbefore described of making metal ties, which consists in forming lateral flanges on a metal plate and then cutting out the middle portion of the latter, substantially as described.

2. The method hereinbefore described of making metal ties, which consists in forming on a metal plate lateral flanges and slots *b b*, and then shearing the plate on lines extending between and beyond said slots and bending lips *c'* between the sheared lines, substantially as described.

3. The method hereinbefore described of making metal ties, which consists in forming on a metal plate lateral flanges and slots *b b*, and then shearing the plate on lines extending between said slots, substantially as described.

4. The method hereinbefore described of making metal ties, which consists in forming in a metal plate slots *b b* and holes *c c*, and then shearing the plate on the lines *c c* and bending the lips *c'*, substantially as described.



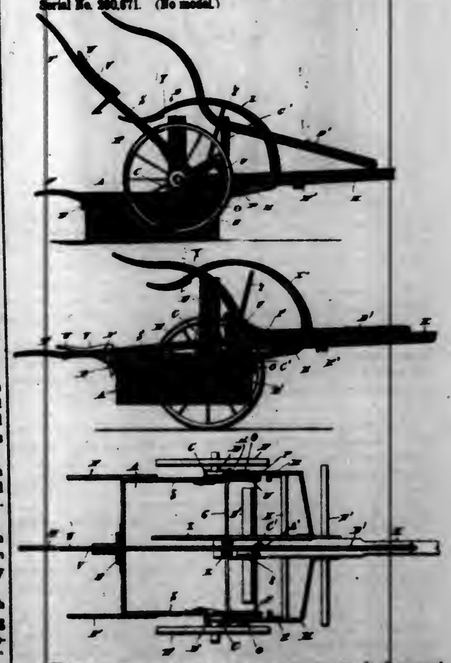
5. The method hereinbefore described of making metal ties, which consists in forming on a metal plate notches *c'* and slots *b b*, bending flanges on the plate, and shearing the plate between the said slots, substantially as described.

6. The method hereinbefore described of making metal ties, which consists in confining or clamping a metal plate, bending lateral flanges thereon, and while confined shearing out the middle portion of the plate, substantially as described.

7. The method hereinbefore described, which consists in forming on a metal plate slots *b b*, and then shearing the plate between said slots, substantially as described.

8. The method hereinbefore described, which consists in forming on a metal plate slots *b b*, and then shearing the plate between and beyond said slots and bending lips *c'* between the sheared lines, substantially as described.

411,118. HOLDER FOR SPECTACLE-CASES. JOHN J. BLOCK and JAMES F. BARRATT, Paducah, Ky. Filed May 28, 1889. Serial No. 311,894. (No model.)



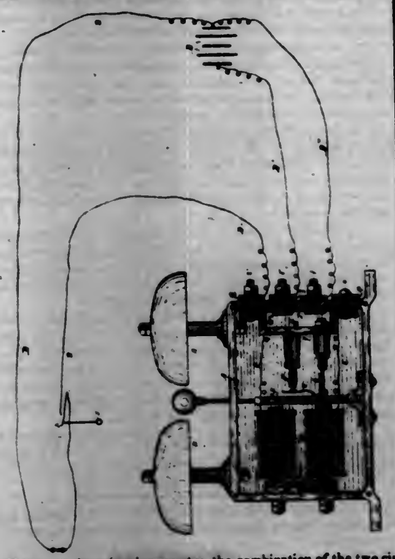
Claim.—1. The blank for a spectacle-case holder having a transverse slot at one end and a tongue at the other end and provided at an intermediate point with the lateral arm F, having the spur G and the perforated legs H, and the spurs I on the edge of the blank adjacent to the said arm F, as set forth.

2. The combination of the band having the transverse slot at one end and the tongue at its other end adapted to engage said slot and having a lateral arm F, and the plate J, pivotally mounted on the said arm F and forming a clasp therewith, as set forth.

3. A band forming a spectacle-case holder adapted to encircle the spectacle-case and hold thereon by spurs struck up from the band and engaging the case, the ends of the band being held together by a tongue-and-slot connection, and the lateral arm F on the band carrying the clasps, as set forth.

411,119. WHEELED SCRAPER. ARCHIE BROWN, Hunt, Ind., assignor of one-half to James S. Irwin, same place. Filed Nov. 13, 1888. Serial No. 290,671. (No model.)

Claim.—1. The combination of the scraper, the standards secured to and vertically movable on the sides of the same and having the spindles on which the supporting-wheels are mounted, the offset bar G, pivoted to the scraper, the tongue secured to the offset bar, and the bail or lever S, pivotally connected to the standards D and connected to the scraper, whereby the latter may be raised and lowered, substantially as described.

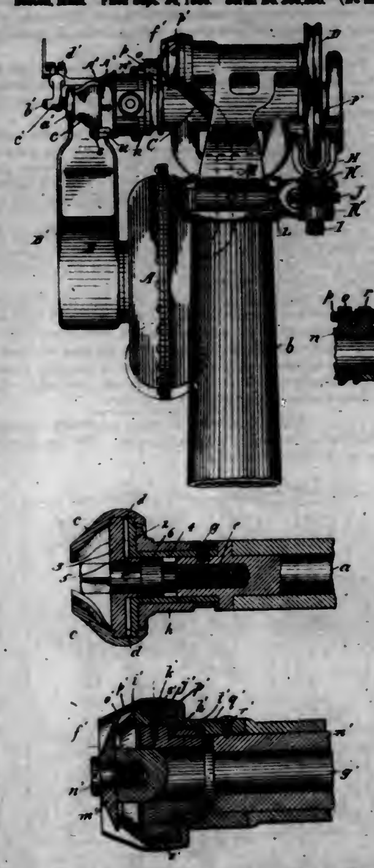


2. The combination of the scraper, the standards secured to and vertically movable on the sides of the same and having the spindles on which the supporting-wheels are mounted, the offset bar G, pivoted to the scraper, the tongue secured to the offset bar, and the bail or lever S, pivotally connected to the standards D and connected to the scraper, whereby the latter may be raised and lowered, and the gravity-hook V, pivoted to the bail or levers and adapted to engage a loop or keeper on the rear side of the scraper, whereby the latter may be turned and discharged of its contents, substantially as described.

3. The combination of the scraper mounted on wheels and adapted to tilt, the tongue, the bar C, guided vertically thereon, the gate secured to the lower end of the said bar, and the lever pivoted on the tongue and connected to the bar C, whereby the gate may be raised and lowered, substantially as described.

4. The combination of the scraper mounted on wheels and adapted to tilt, the tongue, the bar C, guided vertically thereon, the gate secured to the lower end of the said bar, and the lever pivoted on the tongue and connected to the bar C, whereby the gate may be raised and lowered, and the standard on the tongue having the shoulder to engage the lever, for the purpose set forth, substantially as described.

5. The combination of the scraper, the tongue having the brace-rods pivotally connected to the scraper and provided with the studs, the standards movable vertically in guides on the sides of the scraper and having the spindles on which the supporting-wheels are journaled, the bell-crank levers S, pivotally connected to the scraper and connected by links to the wheel-standard, the hooks P, pivoted to the scraper and adapted to engage the studs on the bounds, and the links connecting the said hooks to the bell-crank levers, substantially as described.



411,120. SIGNALING APPARATUS. WILLIAM R. COLE, Detroit, Mich. Filed Jan. 4, 1889. Serial No. 295,402. (No model.)

Claim.—1. In a signal apparatus, the combination of the two circuits and a battery therein, a metal case provided with the signal, an armature and magnets in said case, the metal frame having the thrown-out portion attached to the inside of one wall of the case and insulated therefrom and provided with the projections, the needle attached to one of said projections, and the spring attached at one end to the other projection, insulated therefrom and attached to the armature at the other end, substantially as set forth.

2. The metal case provided with the signal-gong, the magnets and armature in said case, the metal frame attached to one wall of the case and insulated therefrom, the needle and armature-spring attached to said metal frame, a wire attached to one of the magnets and to said frame, a post insulated from the case and frame, a wire connecting the other magnet with said post, a post contacting with the metal case, a battery, a circuit-line direct to the battery from said posts, a post insulated from the metal case, but contacting with the metal frame, a signaling-circuit line running from said latter-named post to the battery, and a suitable number of circuit-breakers in said circuit, all combined and arranged substantially as set forth.

411,121. HEEL-TRIMMING MACHINE. FRANK H. BENNETT, Lynn, assignor, by mesne assignments, to Isaac P. T. Edmands, trustee, Boston, Mass. Filed Sept. 24, 1888. Serial No. 286,202. (No model.)

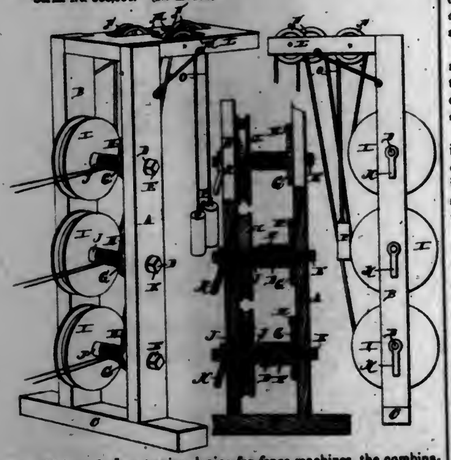
Claim.—1. In a heel-trimming machine, the combination, with the cutters *c*, having grooves on their inner surfaces arranged substantially at right angles with the axis of rotation of the cutter-head, of an expansible two-part holder formed to enter said grooves and composed of a section secured to a shaft and a movable section adapted to be moved or adjusted outward crosswise of said grooves, whereby the holder is enabled to engage the sides of said grooves, substantially as set forth, the minimum conjoint width of said sections being less than that of the said grooves of the cutters, as stated.

2. In a heel-trimming machine, the combination of the shaft *a*, the holder composed of the stationary section 2, secured to said shaft, and the adjustable section fitted to said former section, said sections having curved dovetailed ends, the screw bearing against the inner end of said adjustable section for forcing the same outward, and the cutters having in their inner surfaces dovetail grooves or seats formed to receive the ends of said sections, as set forth, the minimum conjoint width of said sections being less than that of the said grooves of the cutters, as stated.

3. In a heel-trimming machine, the combination of the shaft *a*, the holder-section 2, having the sleeve 4 attached to the shaft and provided with the recess 7, the adjustable holder-section 3, formed to enter said recess, the bolt *e*, engaged, as described, with the shaft and

formed to bear against the inner end of the adjustable section, and the cutters having internal seats or grooves formed to engage the holder-sections, as set forth, the minimum conjoint width of said sections being less than that of the said grooves of the cutters, as stated.

4. In a heel-trimming machine, the combination, with a rotary cutter, of an arm or support arranged in front of the axis of the cutter, a rest pivoted at its inner end to said support and arranged to stand at right angles with the cutter as a support for the side of the heel, said rest being adapted by its pivotal connection to swing out of place and thereby avoid the shank of a boot or shoe sole, and a spring whereby said rest is normally held in a position at right angles with the axis of the cutter and permitted to yield and swing from said position, as set forth.



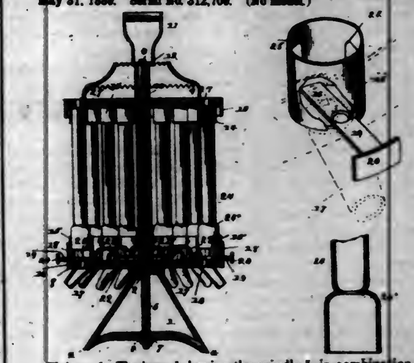
5. The combination, with the cutter-head, of the top-lift rest, the sleeve *n*, supporting said rest and adapted to slide on a fixed bearing, and the screw *p*, journaled in a lug on said bearing and engaged with a tapped socket in a lug on the sleeve *n*, as set forth.

6. In a heel-trimming machine, the combination, with the cutter-head and the rand-trimmer, of the exhaust-fan blower, the trunk or flue connected with the blower and having an enlarged mouth provided with a forwardly-projecting lip and arranged adjacent the cutter-head, the hood *p'*, and the pipe C, connecting said hood with the blower-casing, substantially as set forth.

7. In a heel-trimming machine, the combination, with the exhaust-fan blower, of the hood *p'*, having the slotted arm p^2, the screw and clamping devices for said hood, and the flexible tube connecting said hood and the blower, substantially as set forth.

8. The rand-trimmer composed of the cylindrical head *N'*, having pins *k'*, the knives having segmental flanges *j'*, formed to fit the head and provided with orifices *l'* to receive the pins *k'*, said orifices exceeding the pins in number, the flange *s'*, secured to the head as a means of keeping the knives in engagement with the pins, and the circular guard *m'*, detachably secured to the shaft of the trimmer and serving to hold the rand-trimmer on said shaft, as set forth.

411,122. TENSION DEVICE FOR FENCE-MACHINES. ANDREW J. FORSYTHE and GEORGE I. GWINN, Kokomo, Ind. Filed Apr. 25, 1889. Serial No. 308,556. (No model.)



Claim.—1. In a tension device for fence-machines, the combination, with a suitable frame, of a series of horizontal shafts, sleeves suitably secured upon the said shafts and having ratchet-wheels adapted to engage pawls mounted pivotally upon the frame, wheels or disks mounted loosely upon said shafts, means for temporarily connecting said wheels and causing them to revolve with the said sleeves, and cords attached to the peripheries of said wheels, passing over suitably-arranged guide-pulleys, and having weights attached to their ends, substantially as set forth.

2. In a tension device for fence-machines, the combination of a suitable frame, a series of horizontal shafts journaled therein, sleeves suitably secured upon the said shafts and having ratchet-wheels engaging pawls which are pivoted upon the frame, wheels or disks mounted loosely upon said shafts, thumb-nuts at the outer ends of said shafts, adapted to force the said wheels into contact with said sleeves, and cords attached to the peripheries of said wheels passing over suitable guide-pulleys and having weights attached to their ends, substantially as set forth.

3. The combination of the sill, the vertical standards, the rearwardly-extending bracket at the upper ends of said standards, the sleeves secured upon shafts journaled transversely in the said standards, ratchet-wheels upon the said sleeves, pawls pivoted to one of the standards and engaging the said ratchet-wheels, wheels or disks mounted loosely upon the shafts adjacent to the said sleeves, thumb-nuts upon the outer ends of said shafts, adapted to force said wheels into contact with said sleeves, and cords attached to the peripheries of the wheels, passing over suitable guide-pulleys and provided with weights at their free ends, substantially as herein set forth.

411,123. SHOT-CANISTER. BELL HARDEN, Bellville, Tex. Filed May 31, 1889. Serial No. 312,709. (No model.)

Claim.—1. The base 1, having the spindle 5, in combination with the disk 9, having sockets 14, and with the lower disk 8, having the openings 16, said disks being mounted on the spindle, and valves 19, mounted over the openings, springs 22, connected with the valves, securing-plate 21, encircling the spindle and bearing upon the rear ends of the springs, sockets 15, and the transparent tubes 24, contracted, as at 24°, mounted in the sockets, substantially as specified.

2. In a shot-case, the base having the socket 15, forming an annular flange having one or more independent springs 25, secured upon the inside thereof, in combination with the tube 24, and the upper disk having a corresponding socket for the reception of the upper end of the tube, substantially as specified.

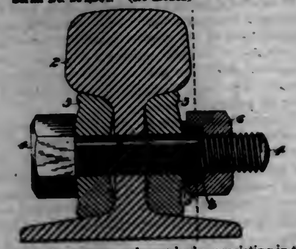
3. In a shot-case, the base 1, having the opening 2 and seat 3, in combination with the shaft 5, terminating in screw-threads 6 and conical end 7, the disks 8 and 9, mounted on the shaft and having interposed sleeves 10 and tubes 15, and the handle 11, having the screw-threaded shank 12, for binding the disks on the shaft, substantially as specified.

4. The disk 8, having the series of perforations 16, the perforated flange 18, the shot-tubes 15, mounted therein, the gate 19, mounted over the perforations and projecting through the openings in the flange, and the springs 23, secured to the rear ends of the gate and to the disk by means of the plate 21, substantially as specified.

5. In a shot-case, the combination of the series of tubes 24, the disk 8, on which the tubes are mounted, having the perforated flange 18, and the perforations 16, which register with the tubes, the series of perforated gates 19, mounted over the perforations 16 and projecting through the perforations of flange 18, the series of springs 23, bearing against the gates, and the plate 21, securing all of the springs in place to the disk 8, as set forth.

6. A shot-case consisting of a suitable support combined with a series of tubes 24, the said tubes being provided with a contracted neck portion 24°, so as to cause the shot to pass out evenly and in such a manner as to leave the shot-line level, as set forth.

411,124. RECEPTACLE FOR SECONDARY BATTERIES. FRED. W. HUNTER, Newton, Mass. Filed Mar. 8, 1889. Serial No. 301,831. (No specimens.)

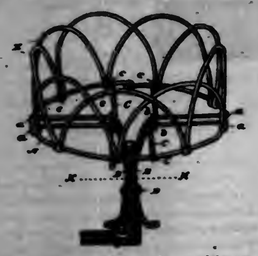


Claim.—1. As a new article of manufacture, a receptacle for secondary batteries, composed of balata as a base, combined with acid-proof material, as asbestus, in suitable quantities, substantially as shed for purposes specified.

2. As a new article of manufacture, a receptacle for secondary batteries, consisting of balata and acid-proof material, as asbestus, ground slate, or analogous substances, mixed in suitable proportions and subsequently vulcanized, substantially as described.

3. As a new article of manufacture, a vessel for secondary batteries, composed of integrally-united homogeneous flexible sheets of acid-proof material, consisting of balata and asbestus, soapstone, or analogous substances, compounded in suitable quantities, as herein stated and set forth.

411,125. NUT-LOCK. HENRY KLEMAN, Pittsburg, Pa. Filed Dec. 26, 1888. Serial No. 294,581. (No model.)



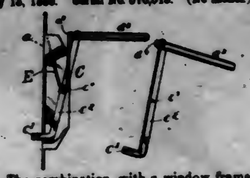
Claim.—1. An improvement in nut-locks, consisting in the combination of the plate, the bolt, the nut having a countersunk cavity on its inner face, and an annular tapering divided washer encircling the bolt and fitting within the countersunk cavity, the said washer being made of sufficient depth that when the nut is tightened on the bolt the washer shall project from the cavity and shall bear against the plate, substantially as and for the purposes described.

2. An improvement in nut-locks, consisting in the combination of the plate, the bolt, the nut having a countersunk cavity on its inner face, and an annular internally-corrugated tapering divided washer encircling the bolt and fitting within the countersunk cavity of the nut and bearing on the plate, substantially as and for the purposes described.

3. An improvement in nut-locks, consisting in the combination of the bolt, the nut having a countersunk cavity on its inner face, a tapering annular divided washer encircling the bolt, fitting within the countersunk cavity, and a pin or projection on the bolt which fits between the divided portions of the washer and prevents turning thereof, substantially as and for the purposes described.

411,126. HEATING ATTACHMENT FOR GAS-BURNERS. CHARLES LOBB, Toronto, Ontario, Canada. Filed Sept. 20, 1888. Serial No. 285,983. (No model.)

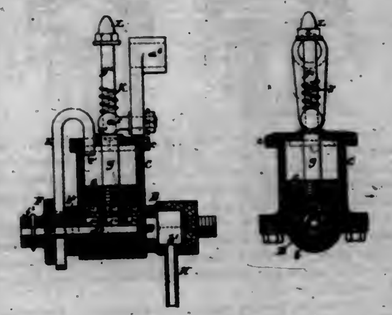
Claim.—1. A heating attachment for gas-burners, composed of a circular rim, a vessel-sustaining rim formed from bowed wires, with their ends abutting each other and secured to the rim, the angular clamping-arms having one end attached to the rim and being extended horizontally inward and bent downward, whereby they are adapted to embrace a gas-burner, the rods securing the horizontal branches of the clamping-arms to the rim, and the ring on the clamping-arms for holding the same to the burner, substantially as specified.



2. In a heating attachment for gas-burners, the combination, with a rim carrying suitable means for attachment to a burner, of a vessel-sustaining rim composed of bowed wires having their ends secured to the rim and abutting against each other, substantially as and for the purposes specified.

411,127. METHOD OF PRODUCING HIGH EXPLOSIVES. HOWARD MAXIM, Plainfield, Mass. Filed May 13, 1889. Serial No. 310,657. (No model.)

Claim.—1. The herein-described process of producing high explosives, consisting in dissolving gun-cotton or nitro-cellulose in a suitable solvent, adding to the dissolved nitro-cellulose nitro-glycerine, and then evaporating from the mixture the volatile solvent, substantially as set forth.



2. The process herein described for manufacturing explosives, which consists in dissolving nitro-cellulose in a volatile solvent, combining therewith nitro-glycerine, and evaporating the volatile solvent therefrom after the admixture of the nitro-glycerine.

411,128. SASH-FASTENER. HENRY H. MEYER, Atkinson, Nebr. Filed May 13, 1889. Serial No. 310,515. (No model.)

Claim.—The combination, with a window frame and sash, of the window-lock C, having the plate *a*, provided with the perforated extensions *a'*, perforated flanges *b*, and the perforation *c*, locking-lever a^3, pivoted between said flanges by means of the pin c^1, the locking-nib passing through said perforation *c*, lever-arm a^3, pivoted to the upper end of said lever-and having in its slotted end the depressions a^4, spring E, having its U-shaped end fitting in said depressions a^4, its arms passing down and coiling around the pin c^1, then up and resting against the inner face of the plate *a*, immediately under the U-shaped end *c*, substantially as shown and described, and for the purposes set forth

411,129. AUTOMATIC BELL-RINGER. FRANK W. RISENBERG and JOHN R. O'HEARNE, Omaha, Nebr. Filed Apr. 16, 1889. Serial No. 307,484. (No model.)

Claim.—1. An oscillating cylinder, in combination with a hollow trunnion having two series of ports b^2, and a valve within the trunnion, and a bell-supporting frame carrying said trunnion with a bell, substantially as and for the purpose described.

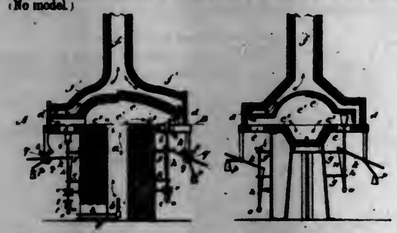
2. The trunnion B, having longitudinal chamber *b*, provided with the opening *b'* and ports b^2 and b^3, in combination with cylinder C, and the valve D, having ports d^2 and the central passage d^3, substantially as and for the purpose described.

3. The combination of the oscillating cylinder C, the trunnion B, having ports b^2, the valve D, having ports and a central passage, and the nut b^4 upon the end of said trunnion, substantially as and for the purpose described.

4. The combination of the oscillating cylinder C, the piston G, piston-rod *g*, and nut L, with the spring K upon said piston-rod, the pin a^2, perforated to receive the piston-rod, the crank-arm a^3, shafts *a* and *a'*, bell-yoke, and bell, substantially as and for the purpose described.

5. The combination of the piston G, the cylinder and its perforated cover *c*, and the bent valve-rod E, entering the perforated cover, with the valve D, the disk F, and pins *f* and *f'* upon said disk, substantially as and for the purpose described.

6. The combination of a bell-supporting frame, the trunnion B, the cylinder C, mounted upon said trunnion, the tubular valve D, the valve-rod E, the valve-disk F, having pins *f f'*, and the piston G, adapted to lift the valve-rod, substantially as and for the purpose described.

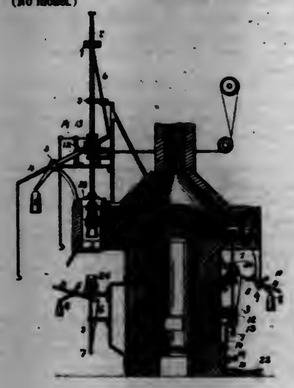


7. The combination of a bell, a bell-supporting frame, the hollow trunnion B, the oscillating cylinder C, valve D, valve-rod E, valve-disk F, piston G, and rod *g*, with the crank-pin a^2 and crank-arm a^3, substantially as and for the purpose described.

411,130. STOVE-PIPE COUPLING. ANDREW J. ROBINSON, Bethgate, Dak. Filed Mar. 19, 1889. Serial No. 303,857. (No model.)

Claim.—The herein-described pipe-coupling, comprising the band, a plate C, rigidly secured near one end thereof, having an arm D, provided with the shoulders d and d^3 and groove d', for the purpose set forth, and a link pivotally secured to the other end of the band and adapted to receive said arm, substantially as set forth.

411,131. FURNACE FOR HEATING GLASSWARE. HERMANN SCHULER-BERGE, Rochester, Pa. Filed Nov. 19, 1888. Serial No. 291,293. (No model.)



Claim.—1. A furnace for heating glassware, consisting in a combustion-chamber provided with a floor over which the gases of combustion pass and which is provided with a glory-hole or glory-holes accessible from below for the introduction and withdrawal of a glass article, substantially as and for the purposes described.

2. A furnace for heating glassware, consisting in a combustion-chamber and a floor provided with a glory-hole or glory-holes accessible from below, in combination with a carrying-rod located below the glory-hole and means for raising the rod thereto, substantially as and for the purposes described.

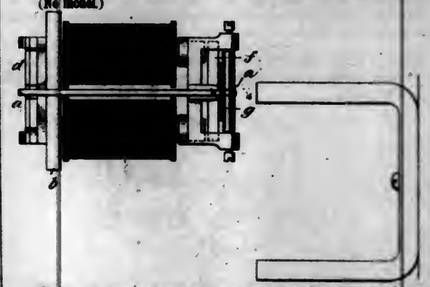
3. A furnace for heating glassware, consisting in a combustion-chamber and a floor provided with a glory-hole or glory-holes accessible from below, in combination with an upwardly-movable rotary carrying-rod located below the glory-hole and means for effecting the upward motion and revolution of the carrying-rod, substantially as and for the purposes described.

411,132. APPARATUS FOR REHEATING GLASSWARE. HERMANN SCHULER-BERGE, Rochester, Pa. Filed Dec. 31, 1888. Serial No. 295,103. (No model.)

Claim.—1. In apparatus for reheating and finishing glassware, the combination of a vertical supporting-rod, a vertically-movable bearing in which it is suspended, and stationary bearings in which it is revolvable and vertically movable, substantially as and for the purposes described.

2. In apparatus for reheating and finishing glassware, the combination, with a heating flue or furnace provided with an opening or openings admitting of the introduction of articles in a vertical direction, of a suspended carrying-rod adapted to slide vertically in bearings stationary with relation to the said opening or openings and a shaping-tool, substantially as and for the purposes described.

3. In apparatus for reheating and finishing glassware, the combination, with a heating flue or furnace provided with an opening or openings admitting of the introduction of articles in a vertical direction, of a suspended revolvable carrying-rod adapted to slide vertically in bearings stationary with relation to the said opening or openings, a shaping-tool, and means for revolving the carrying-rod, substantially as and for the purposes described.

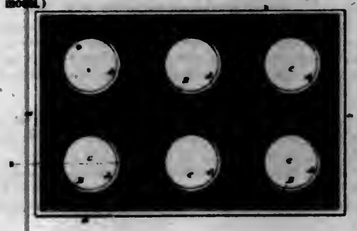


4. In apparatus for reheating and finishing glassware, the combination, with a heating flue or furnace provided with an opening or openings admitting of the introduction of articles in a vertical direction, of a suspended revolvable carrying-rod adapted to slide vertically in bearings stationary with relation to the said opening or openings, a shaping-tool, means for revolving the carrying-rod, and means for interrupting the rotation thereof, substantially as and for the purposes described.

5. In apparatus for finishing glassware, the combination of a vertically-movable carrying-rod, a shaping-tool, and a spring-arm for pressing the article on the shaping-tool, substantially as and for the purposes described.

6. In apparatus for finishing glassware, the combination of a vertically-movable carrying-rod, a shaping-tool, and a spring-arm for pressing the article on the shaping-tool, said spring-arm having a swivel-jointed end, substantially as and for the purposes described.

7. In apparatus for finishing hollow articles of glassware, a supporting-rod and a former in the path of the rod, said rod being vertically movable to cause the former to receive and shape the article, substantially as and for the purposes described.

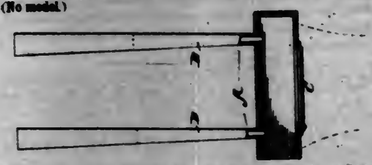


411,133. ELECTRIC POLARIZED ANNUNCIATOR. CHARLES R. SCRIBNER, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Dec. 27, 1886. Renewed Nov. 21, 1887. Serial No. 256,773. (No model.)

Claim.—1. In an electro-magnet, the centrally-pivoted polarized armature in combination with a hook or detent, said hook or detent operating a signal device and placed near the centrally-pivoted armature, whereby said hook is struck alternatively as the armature vibrates.

2. The combination of the armature f, the striker g, and the lugs $e\,e$ with the hook or detent, and a signal device operated by said hook or detent, substantially as described.

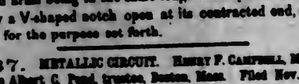
411,134. GRATING FOR ILLUMINATING-TILES. THEODORE SHARTS, New York, N. Y. Filed May 23, 1889. Serial No. 311,791. (No model.)



411,134.

Claim.—A grating for illuminating-tiles, having light-openings therein, surrounded by protruding rings of a different metal for the reception of lenses, said rings being rigidly united to the grating by casting the metal of the grating around that of the rings, substantially as set forth.

411,135. REED AND FLUE PIPE FOR ORGANS. JOHN STAFFORD, Lower Cove, Nova Scotia, Canada. Filed Mar. 14, 1889. Serial No. 303,302. (No model.)



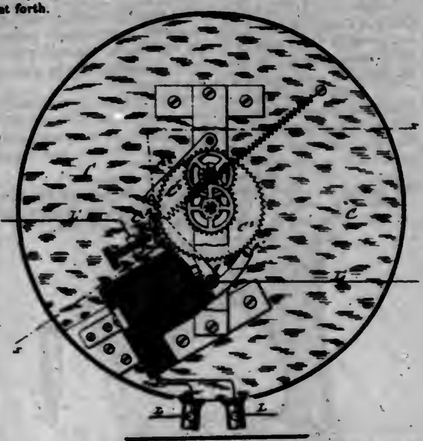
Claim.—In a pipe or flue for wind-instruments, the combination of the foot-tube having the sound-producing agent arranged without the same and the parallel imperforate tubes B B, of equal length, communicating at one end with the said foot-tube, substantially as specified.

411,136. NEEDLE. EARL SWIM, Cedar Rapids, Iowa. Filed July 1, 1889. Serial No. 316,205. (No model.)

Claim.—As an improved article of manufacture, the herein-described needle, provided with an elongated eye, one side of which being formed by a rigid arm b, having a squared end, the face of the latter being at right angles to said arm, and a spring or yielding arm b', having its end inwardly beveled and projecting nearly to the end of arm b, said arms being in the same longitudinal plane, and forming conjunctively a V-shaped notch open at its contracted end, substantially as and for the purpose set forth.

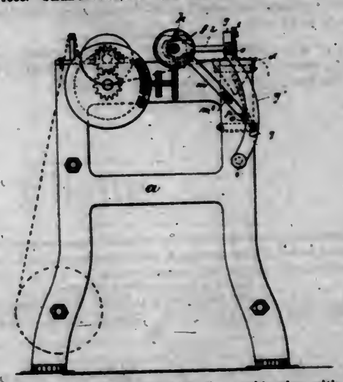
411,137. METALLIC CIRCUIT. HENRY F. CAMPBELL, Malden, assignor to Albert C. Pond, trustee, Boston, Mass. Filed Nov. 24, 1888. Serial No. 291,791. (No model.)

Claim.—1. The combination, with a metallic circuit composed of two branches or wires $a\,a'$, the branch a being an insulated conductor of high conductivity and the branch a' an uninsulated wire of lower conductivity, of a bare wire wound or bound about the said branches throughout the length of the circuit to separate and yet bind the said branches, substantially as described.



2. The combination, with the metallic circuit composed of two branches or wires $a\,a'$, the branch a being an insulated conductor of high conductivity and the branch a' an uninsulated wire of lower conductivity, of a separator wound about one of the wires or branches and a bare wire wound about the said branches throughout the length of the circuit, substantially as described.

3. The combination, with a metallic circuit composed of two branches or wires $a\,a'$, the branch a being an insulated conductor of high conductivity and small cross-section and the branch a' an uninsulated wire of lower conductivity, but of larger cross-section to effect a balance in the metallic circuit, of a bare wire wound or bound about the said branches throughout the length of the circuit, substantially as described.



411,138. ELECTRIC-CLOCK SYSTEM. CHARLES H. CARTER, Brooklyn, N. Y. Filed Dec. 27, 1888. Serial No. 294,515. (No model.)

Claim.—1. The combination of a main circuit, a master-clock having circuit-closing devices located in the main circuit, a number of secondary clocks provided with clock-trains and having electro-magnets disposed in said main circuit, oscillating armature-levers actuated by said electro-magnets and provided with pallets for engaging said clock-trains, an auxiliary circuit composed of fixed contact-studs located adjacent to said armature-levers, and wires connecting the fulcrums of said levers with said fixed contact-studs, and a tell-tale clock located in said auxiliary circuit and operated thereby, substantially as described.

2. In an electric-clock system, the combination of a master-clock, an insulating-disk on an arbor of the clock mechanism, a radial contact-pin in said disk forming contact with the arbor, a contact-spring riding on the surface of said disk, a metallic disk on said arbor provided with an insulated segment in line with and of greater size than the contact-pin of the insulating-disk, a second contact-spring riding on the metallic disk, a shunt-circuit connected with the second contact-spring, and a resistance-coil in said shunt-circuit, substantially as set forth.

411,139. LISTING-MACHINE. THEODORE J. DERBY, Bloomfield, N. J., assignor of one-half to Walter R. William, same place. Filed Aug. 6, 1888. Serial No. 282,060. (No model.)

Claim.—1. In a listing-machine, the combination, with a listing-blade e, mounted on a reciprocating pivoted carrier and movable in a curved path, of a bed having a convex surface concentric with said path and means, substantially as described, for reciprocating the said pivoted carrier, substantially as and for the purpose set forth.

2. In a listing-machine, the combination, with a listing-blade e, mounted on a pivoted carrier and movable reciprocally in a curved path, of a reciprocating bed having a curved listing-surface to co-operate with said listing-blade and means, substantially as described, for producing the reciprocating movements of said bed and carrier, substantially as set forth.

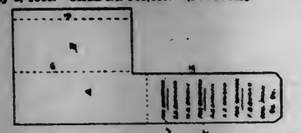
3. In a listing-machine, the combination, with a convex listing-bed, of a driving-shaft, an eccentric f arranged thereon, vibrating arms carrying the carrier g and the listing-blade, and rod h, connecting the eccentric with said carrier, substantially as and for the purpose set forth.

4. In combination, a frame a, blade e, carrier g, eccentric f, rod h, arm g', convex bed d, plate l, rod m, and cam k, all arranged and adapted to operate substantially as and for the purposes set forth.

5. In combination, a frame a, listing-blade e, carrier g, adjusting means between the blade e and carrier g, eccentric f, and rod h, arm g', plate l, bed d, rod m, and cam k, all said parts being arranged and adapted to operate substantially as and for the purposes set forth.

411,140. SHELL FOR WINDING PAPER. GEORGE B. FARRINGTON and HELEN CURTIS, Bridgeport, Conn. Filed Nov. 10, 1888. Serial No. 290,410. (No model.)

Claim.—1. As a new manufacture, a shell for winding paper, consisting of a body formed of paper cemented together under pressure and protected at the ends by flanged metallic bushings, said bushings being concentric and of even internal diameter with the shell and the flanges of even peripheral diameter therewith.



2. A shell for winding paper, consisting of a body formed of paper wound and cemented together under pressure and protected at the ends by flanged metallic hubs, each hub having an enlargement under the flange, and a groove in said enlargement to receive a key in securing the shell in place upon the shaft.

411,141. SHOE FOR GRAIN-DRILLS. CHARLES L. FOWLS, Dowagiac, Mich., assignor to the Dowagiac Manufacturing Company, same place. Filed Aug. 22, 1888. Serial No. 283,502. (No model.)

Claim.—A drill-shoe having the side plates converging at the base and a wedge-shaped bar attached between the plates at said base, substantially as set forth.

411,142. ENVELOPE-BALLOT. JOHN R. GATHRIGHT, Louisville, Ky., assignor to himself, William A. Harrivethor, and Robert M. Kelly. Filed May 6, 1889. Serial No. 309,695. (No model.)

Claim.—An envelope-ticket for secret voting, consisting of body portions A and B, a flap portion *b*, and a ticket portion L, substantially as set forth, and for the purpose specified.

411,143. CLOTH-PRESSING MACHINE. DAVID GREENER, Worcester, Mass. Filed Aug. 21, 1888. Serial No. 283,345. (No model.)

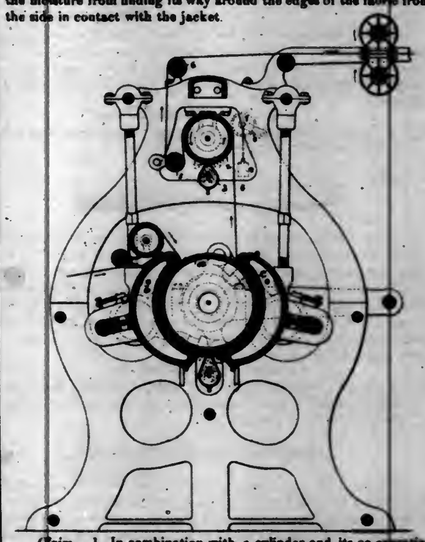
Claim.—1. In combination, the cylinder, the apron co-operating therewith, the jacket enveloping the cylinder, a moistening device co-operating with said apron, and a moistening device co-operating with said jacket, substantially as described.

2. In combination, the cylinder, a pressing device co-operating therewith, a jacket enveloping the cylinder, an apron covering the face of the pressing device, a steamer co-operating with said jacket, and a steamer co-operating with said apron, substantially as described.

3. In combination, the cylinder, the absorbent traveling surface co-operating therewith, the jacket enveloping the cylinder, a moistening device arranged to moisten said absorbent traveling surface upon the face thereof which comes next to the jacket, and a moistening device arranged to moisten said jacket, substantially as described.

4. In combination, the cylinder provided with an internal chamber for heating, the jacket enveloping the same, the absorbent traveling pressing-surface co-operating therewith, a moistening device arranged to moisten said jacket, and another to moisten said absorbent traveling surface, substantially as described.

5. In combination, the cylinder, the jacket enveloping the same, the absorbent traveling pressing-surface co-operating therewith, and moistening devices arranged to moisten, respectively, the jacket, the absorbent traveling pressing-surface, and the cloth as it is about to be pressed, substantially as described.



6. In combination, the cylinder, the jacket enveloping the same, the absorbent traveling pressing-surface co-operating therewith, and a moistening device arranged to moisten the jacket, substantially as described.

7. In combination, the cylinder, the jacket enveloping the same, the absorbent traveling pressing-surface co-operating therewith, and a moistening device arranged to moisten the cloth before receiving pressure between the absorbent traveling surface and the jacket, substantially as described.

8. In combination, the cylinder, the jacket enveloping the same, the absorbent traveling pressing-surface co-operating therewith, and a moistening device arranged to moisten said traveling pressing-surface, substantially as described.

411,144. CLOTH-PRESSING MACHINE. DAVID GREENER, Worcester, Mass. Filed Oct. 13, 1888. Serial No. 288,032. (No model.)

Brief.—One of the features of the case is a presser-roller (7) provided with an absorbent surface at its ends, the object being to prevent the moisture from finding its way around the edges of the fabric from the side in contact with the jacket.

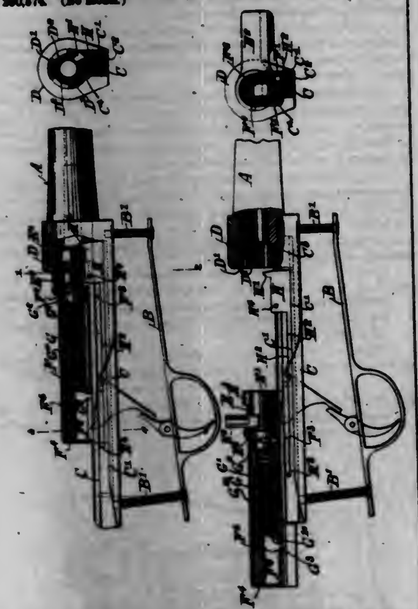
Claim.—1. In combination with a cylinder and its co-operating bed-plate or bed-plates, a moisture-absorbing fabric, means for supporting the same, a moistening device or steamer for moistening said fabric, and means whereby the cloth after being pressed is held in contact with said moistened fabric without substantially compressing the cloth, substantially as described.

2. In combination with a cylinder and its co-operating bed-plate or bed-plates, a traveling moisture-absorbing fabric, means for actuating the same, a moistening device or steamer for moistening said fabric, and means whereby the cloth after being pressed is held to travel in contact with said traveling moistened fabric without substantially compressing the cloth, substantially as described.

3. In combination with a cylinder and its co-operating bed-plate or bed-plates, a traveling moisture-absorbing fabric, means for actuating and heating the same, a moistening device or steamer for moistening said fabric, and means whereby the cloth after being pressed is held to travel in contact with said traveling moistened fabric without substantially compressing the cloth, substantially as described.

4. In combination with a cylinder and its co-operating bed-plate or bed-plates, a traveling moisture-absorbing fabric, means for actuating the same, a moistening device or steamer for moistening said fabric on the side coming in contact with the cloth, and means whereby the cloth after being pressed is held to travel in contact with said traveling moistened fabric without substantially compressing the cloth, substantially as described.

5. In combination with a cylinder and its co-operating bed-plate or bed-plates, a traveling moisture-absorbing fabric, means for actuating the same, a moistening device or steamer for moistening said fabric, and means whereby the cloth after being pressed is held to travel in contact with said fabric, admitting of a slip between the cloth and the fabric, substantially as described.



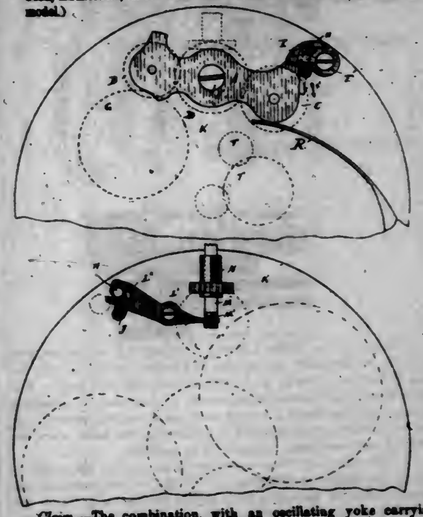
6. In combination with a cylinder and its co-operating bed-plate or bed-plates, a moisture-absorbing fabric, means whereby the same is caused to travel faster than the cylinder, and means whereby the cloth after being pressed is held to travel in contact with said fabric, admitting of a slip between the cloth and the fabric, substantially as described.

7. In combination with a cylinder and its co-operating bed-plate or bed-plates, a moisture-absorbing fabric, means for supporting the same, a moistening device or steamer for moistening said fabric, means whereby the cloth after being pressed is held to travel in contact with said moistened fabric without substantially compressing the cloth, and a yielding holder whereby the cloth is held against the moistened fabric, substantially as described.

8. In a cloth-pressing machine, in combination with a device whereby the cloth is moistened or steamed on one side, a roller presenting an absorbent surface near its ends and a comparatively smooth surface toward its middle, around which the cloth passes after being moistened or steamed, substantially as described.

9. In combination, two cylinders, a bed-plate or bed-plates operating with the first cylinder, a moisture-absorbing fabric upon the second cylinder, a steamer or moistener for supplying moisture to the said fabric, and means whereby the cloth is held in contact with said moistened fabric without substantially compressing the cloth, substantially as described.

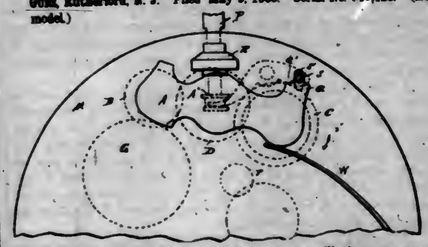
411,145. BREECH-LOADING SMALL-ARM. PHILIP T. GODSAL, Hem, County of Buckingham, England. Filed Nov. 15, 1888. Serial No. 290,574. (No model.)



Claim.—1. The breech-action for small-arms herein shown and described, and consisting of a stock-bar C, having a lateral rib C', a lateral projection C^3, and a recess at its upper part and a flat or curved upper surface, a hollow block D, having ways D' and projections D^2, and an internal thread, a cylinder E, having radial lugs E', handle E^2, groove E^3, and an incline E^4 on the rear face of the cylinder, a hollow cylinder F, having external downward projections F', rim F^2, the front portion of the said cylinder F being cut away and forked, projections F^3, and a filling-plug F^4, a striker having a cylindrical portion G' and a rectangular portion G^{2a}, a collar G^2, with an external inclined face G^4, a striking-point at its front end and a downward projection G^3 at the rear end, a cartridge-extractor consisting of a block H, an upwardly and inwardly projecting claw H', a long stem H^2, and a stop H^3, all combined and operating as herein shown and described.

2. In a breech-action for small-arms, the combination, with the breech portion D of the barrel, of the stock-bar C, the upper face of which forms a rearward continuation of the outer edge of the lower lug of the breech portion D, a saddle-block F, adapted to fit onto and slide upon the stock-bar, and a breech-block E in front of said saddle-block, all as and for the purpose set forth.

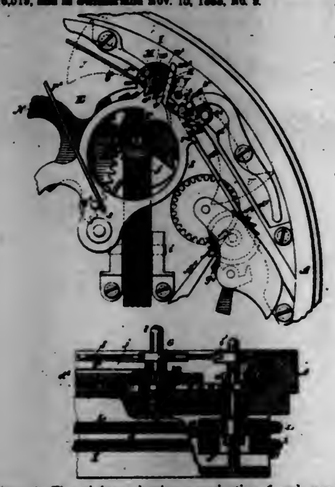
3. In a breech-action for small-arms, the combination of a stock-bar C, forming a rearward continuation of the lower lug of the breech of the barrel and having a laterally-extending rib, an extractor H, of the form shown, arranged to slide on the said rib, and a saddle-block F, formed with downwardly-projecting parts which overlie the extractor and hold it in position, and which also serve to actuate the extractor at the proper time, as and for the purpose set forth.



4. In a breech-action for small-arms, the safety arrangement herein shown and described, and consisting of a cylindrical block E, having at one end a ratchet-tooth E^4 and near its other end a handle E^2, a striker G', formed near its front end with a collar, the outer face of which has a ratchet-tooth G^4, a mainspring G in rear of the collar, and a saddle-block F, all combined and operating as shown and described.

411,146. STEM WINDING AND SETTING WATCH. OMAR F. GUM, Rutherford, N. J. Filed Mar. 30, 1889. Serial No. 305,492. (No model.)

Claim.—The combination, with an oscillating yoke carrying wheels for engagement with the spring-barrel wheel and the hand-setting wheels, of a tubular pinion engaged with the central wheel of the yoke, a sliding stem or push-pin in the tubular pinion and provided with an annular groove, a cam pivoted to act on one end of the yoke and provided with a pin or lateral projection passing through a slot in the main plate, a pivoted lever engaging at one end said pin or projection of the cam and at the opposite end entering the annular groove in the stem or push-pin, and a single spring acting on the yoke and tending to engage with a wheel on the same with the spring-barrel wheel of the watch, substantially as set forth.



411,147. STEM WINDING AND SETTING WATCH. OMAR F. GUM, Rutherford, N. J. Filed May 9, 1889. Serial No. 310,120. (No model.)

Claim.—In a watch, the combination of an oscillating arm carrying wheels for engagement with the spring-barrel wheel and the hand-setting wheels, which yoke has an extension provided with a notch or recess in its edge, said notch or recess forming a cam-edge, a tubular pinion engaged with the central wheel on the yoke, a squared stem

or push-pin passed through the tubular pinion and provided with an annular groove at its inner end, a lever pivoted on that side of the main plate opposite the one on which the yoke is located, which lever has one end passed into the groove in the inner end of the push-pin, a pin projecting from the opposite end of said lever through a slot in the main plate and resting on the notched cam-edge of the yoke-extension, and of a spring acting on the yoke and pressing the edge of the same against said pin, substantially as set forth.

411,148. REPEATING-WATCH. EDOUARD HEUER, Bienne, Switzerland. Filed Feb. 6, 1889. Serial No. 299,223. (No model.) Patented in France Oct. 17, 1888, No. 193,640; in England Nov. 14, 1888, No. 16,519, and in Switzerland Nov. 15, 1888, No. 9.

Claim.—1. The pinion *c*, having a projection *f*, and means, substantially as described, for turning said pinion, combined with the lever F, to be actuated by said pinion, arbor *l*, carrying teeth *o*, pinion or wheel *a*, and means, substantially as described, for actuating the same, and the sleeve *q*, having teeth *p* and toothed sector H, and means, substantially as described, for returning the sector when the teeth *o p* are disengaged, substantially as specified.

2. The pinion or wheel *a* and means for turning the same, its arbor *l*, and teeth *o*, in combination with the toothed sector H, and teeth *p*, connected therewith for engaging the teeth *o*, and with the hammer J, and tooth *v*, connected with said hammer, said tooth being actuated by the toothed sector H, and means, substantially as described, for returning said sector to the actuating position when the teeth *o p* are unlocked, substantially as described.

3. The combination of a driving-train of gearing and a pinion or wheel *a* in said train, a clutch actuated by the same, and a toothed sector connected with said clutch, with a hammer and gong, a pin carried by said hammer, a segment adapted to contact said pin to turn the hammer, and a tooth *v*, connected with said segment to be actuated by the toothed sector, and with mechanism, substantially as described, for returning the toothed sector to the actuating position when the clutch is unlocked, substantially as described.

4. The combination, with a driving-train containing a pinion or wheel *a*, a clutch driven by said wheel, and a pinion *m*, connected with said clutch, of a toothed rack or segment gearing with said pinion and a spring for moving said rack in the reverse direction to its movement by the driving-train when the clutch is unlocked, substantially as described.

5. The combination of the lever F, having the incline *h*, and the pinion *c*, having the projection *f*, to engage said incline, and means, substantially as described, for actuating said pinion with a driving-train having a pinion or wheel *a* and a clutch connected with said wheel, a pinion connected with said clutch, a toothed rack or segment gearing with said pinion, and a spring for moving said rack or segment in the reverse direction to its movement by the driving-train, the projection *f* on the pinion *c* actuating the lever F to unlock the clutch, substantially as described.

6. The pinion or wheel *a* and its driving mechanism, and the clutch *o p*, sleeve *q*, toothed sector H, and finger G, carried by said sleeve, combined with the hammer J, its arbor I, the pin M, carried by the hammer, the segment *w*, having tooth *v*, sleeve R, having tooth i^3 and projection j^3, lever S, having teeth e^3 and projection T, and with mechanism, substantially as described, for returning the sector H and lever S to their actuating position, substantially as described.

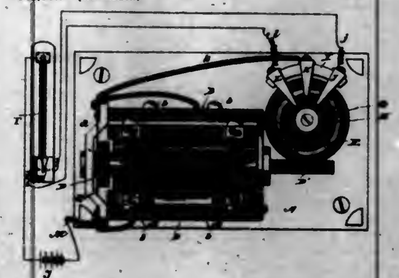
7. The pinion or wheel *a* and its driving-train and a clutch connected with said wheel, a segment-rack and a pinion driven by said wheel, a hammer J, and a tooth *v*, connecting said hammer with the sector H, combined with a lever N, having a segment-rack d^3 and a projection e^3, and with a cam O, having a series of unequal projections or planes f^3, adapted to be engaged by said projection e^3, and mechanism, substantially as described, for turning the cam intermittently to present a different plane to the projection e^3, all arranged for operation substantially as described.

8. The pinion or wheel *a* and its driving-gear, a clutch connected with said wheel, a toothed sector, a pinion, and a finger or cam G, connected with said clutch, a hammer J, having a pin M, a segment *w*, having a tooth *v* to engage said sector, a sleeve R, having a tooth i^3, and a projection j^3, combined with the lever S, having teeth e^3 to engage the tooth i^3 and a projection T to be engaged by the finger or cam G, and with the lever N, having segment-rack d^3, engaging the pinion on the clutch, a projection e^3 on said lever, and a cam O, having a series of different planes f^3, means, substantially as described, for turning said cam, and means, substantially as described, for disengaging the clutch and turning the parts in the reverse direction to their movement by the wheel *a*, substantially as specified.

9. The lever F and means, substantially as described, for rocking said lever, combined with a driving mechanism having an escapement-wheel f^4, and with a lever A^3, that rests at one end against the lever F, and that is adapted to contact the escapement-wheel f^4 when said lever F is depressed, and with a spring h^4 for holding the lever A^3 in contact with the lever F, substantially as described.

10. The lever F, having the incline *i*, combined with a hand-setting lever A^4, adapted to engage said incline, and thereby to depress the lever F, substantially as described.

11. The hand-setting lever A^4, combined with a lever b^3, having a projection a^6 to be engaged by the lever A^4, and with the lever N, adapted to be contacted by the lever b^3 to stop the movement of the lever N, substantially as described.

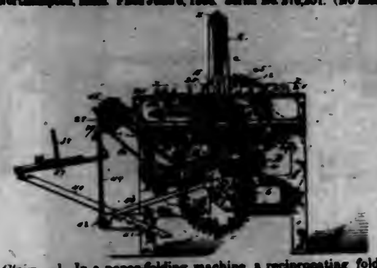


12. The lever b^3 and the lever N, adapted to be engaged by the lever b^3, combined with the lever d^4, one end of said lever d^4 being adapted to actuate the lever b^3, the opposite end of said lever d^4 passing through the casing of the watch to be engaged by the finger of the operator, substantially as described.

13. The hammer U, journaled in the plate E, and having a pin T^2, that passes through a slot in said plate, the arbor of the hammer having the tooth s^4, and the projection h^4, combined with the lever S, having the teeth r^3 to engage the teeth s^4, and with mechanism, substantially as described, for oscillating the lever S to actuate the hammer U, substantially as described.

411,149. BLUE DYE. DANIEL E. HOUGUENIN, Basle, Switzerland, assignor to Société L. Durand, Huguenin & Compagnie, same place. Filed Oct. 30, 1888. Serial No. 289,552. (No specimens.) Patented in France Oct. 3, 1888, No. 193,236.

Claim.—A compound dye for dyeing fabrics and fibers, consisting of indigo and indophenol combined, substantially as set forth.

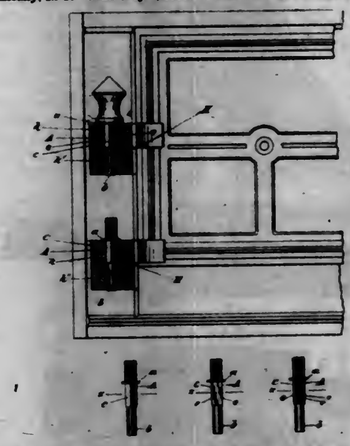


411,150. ELECTROMOTOR. MARY A. KIMBELL, Chicago, Ill., executrix of Abraham S. Kimball, deceased. Filed Apr. 1, 1889. Serial No. 305,617. (No model.)

Claim.—1. The combination, with the revolving armature-shaft of an electomotor, of an annular plate geared to rotate in unison therewith and electrically connected in the motor-circuit, said plate having cam-surfaces and contacts joined also in the motor-circuit and adapted to engage said cam-surfaces intermittently, whereby to make and break said motor-circuit, substantially as described.

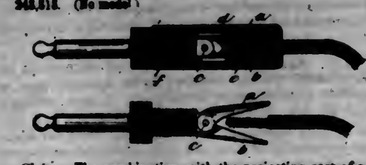
2. The combination, with the threaded end of a revolving armature-shaft, of an electromotor, of a worm-wheel driven by said threaded end, an annular plate mounted on said wheel, but insulated therefrom, a contact joined in the motor-circuit and adapted to bear constantly on said plate, the latter having an interrupted portion to provide cams, and a contact joined also in the motor-circuit and adapted to engage said cams intermittently to make and break the motor-circuit, substantially as described.

411,151. PAPER-FOLDING MACHINE. JOSEPH C. KNEELAND, Northampton, Mass. Filed June 6, 1888. Serial No. 276,261. (No model.)



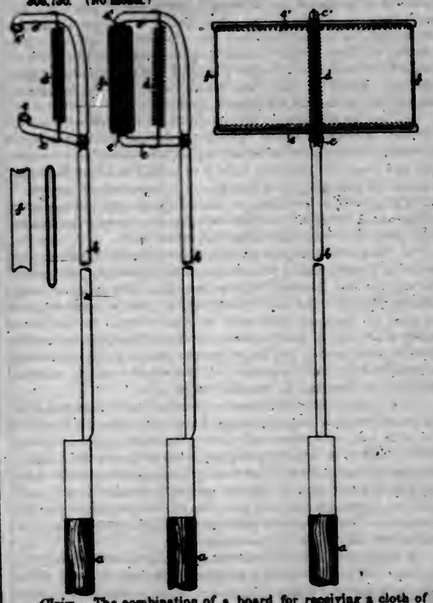
Claim.—1. In a paper-folding machine, a reciprocating folding-blade to engage the paper to be folded, two parallel fold-compressing rolls, one of which has a longitudinal rib thereon the surface of which rotates coincidingly with the surface of the adjoining roll, said rib being peripherally arranged with relation to the folding-blade to nip the fold of the paper between said rib and the surface of the adjoining roll immediately on the lowermost presentation of said paper by said folding-blade, substantially as described.

2. In a paper-folding machine, a reciprocating folding-blade to engage the paper to be folded, two parallel fold-compressing rolls, one of which has a narrow longitudinal rib thereon, said rib being arranged to nip the paper presented by said folding-blade between said rib and the surface of the other roll only at the folded portion thereof, substantially as described.



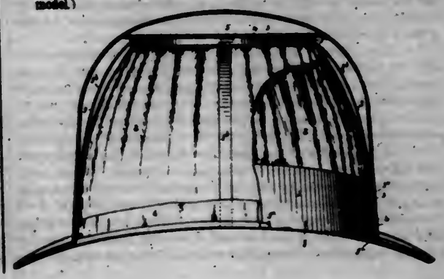
3. In a paper-folding machine, a reciprocating folding-blade to engage the paper to be folded, a fold-compressing roll and sliding journal-boxes therefor a second fold-compressing roll having a longitudinal rib thereon, said rib being peripherally arranged with relation to the folding-blade to nip the fold of the paper between said rib and the surface of the adjoining roll immediately on the lowermost presentation of said paper by said folding-blade, and springs acting against said journal-boxes to force the one roll toward the other, substantially as described.

411,152. PIN FOR HINGES OF STOVE-DOORS. DAVID C. KUHN, Albany, N. Y. Filed May 7, 1888. Serial No. 273,161. (No model.)



Claim.—The combination, with the upper knuckle *k* and lower knuckle *k'*, having each a pin-hole of the same diameter as the other, of the hinge-pin A, provided with a head-end shoulder *a*, and having its half portion *c* provided with three or more ridges *e e*, running parallel with the axis of the pin and projected uniformly past the line of the circumference of its cylindrical portion *b* for engagement or tight holding with the metal surrounding the hole of one of the knuckles, the cylindrical portion *b* being of smaller diameter than the pin-hole in the other knuckle, substantially as and for the purposes set forth.

411,153. TERMINAL PLUG ATTACHMENT FOR FLEXIBLE ELECTRIC CORDS. SAMUEL C. LAWRENCE, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Sept. 5, 1887. Serial No. 248,818. (No model.)



Claim.—The combination, with the projecting core of an electric cord and the insulating covering thereof, of the clasp consisting of two jaws pivoted to the stem of the plug and pressed firmly against the said core and covering by the handle placed over the said jaws and screwed upon the thread provided on the stem, substantially as shown and described.

411,154. APPARATUS FOR CLEANING WINDOWS. ARTHUR LADER, Dresden, Saxony, Germany. Filed Apr. 26, 1889. Serial No. 308,730. (No model.)

Claim.—The combination of a board for receiving a cloth of a holder, consisting of a rod and two jaws upon the rod for clamping between them the upper and lower edges of the board with the cloth upon it, one of said jaws being pivoted to said rod, and a spring for forcing said pivoted jaw toward the other jaw, both of said jaws extending at approximate right angles to the direction of the length of said rod and both upon the same side of said rod, substantially as specified.

411,155. DETACHABLE HAT SWEAT AND LINING. FRANK W. LEWIS, Brooklyn, N. Y. Filed July 17, 1889. Serial No. 317,784. (No model.)

Claim.—As a new manufacture, a detachable hat sweat and lining, the same consisting of a suitable frame-work, a lining within said frame-work and carried thereby, and a sweat, also within said frame-work and covering the lower end of the lining, the lower edge of the sweat being turned over the bottom of the frame-work and secured thereto.

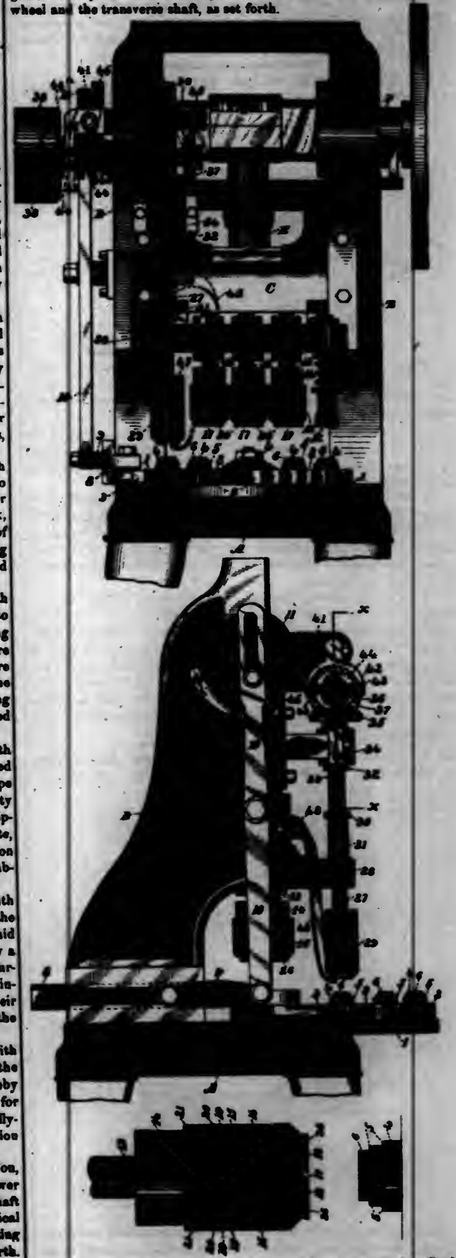
411,156. MACHINE FOR FORMING SCREW-THREADS ON ARTICLES OF SHEET METAL. WILLIAM P. LEWIS, Waterbury, Conn., assignor to the Plume & Atwood Manufacturing Company, same place. Filed Apr. 24, 1889. Serial No. 308,630. (No model.)

Claim.—1. In a machine of the character described, the combination, with the plurality of lower dies each having thereon the configuration to be imparted to the finished article, and means for moving said dies step by step beneath the upper dies, of the press-gate, the upper dies, secured thereon, carried thereby and having interrupted operative surfaces complementary to those upon the lower dies and out of coincidence in the successive dies, and wedges moving with and adapted to actuate the sections of said upper dies, substantially as specified.

2. In a machine of the character described, the combination, with a plurality of lower dies each conformed to the shape of the finished article to be produced, and a rotating plate whereby said lower dies are presented seriatim to the upper dies, of a plurality of radially expansible and contractible upper dies, the gate for vertically reciprocating said dies, wedges for imparting the radial expansion and contraction thereunto, and a gripper properly timed relative to said upper dies and adapted to remove the finished work from the lower dies, substantially as and for the purpose set forth.

3. In a machine of the character described, the combination, with the lower dies and the plate whereby they are presented seriatim to said dies, of the plurality of radially expansible and contractible upper dies and means for operating their jaws toward and from the work, a cushioned pressure-block operating one or more steps in advance of the said upper dies, and a gripper carried by the gate and operating subsequent to the said upper dies and adapted to remove the finished work from the lower dies, substantially as set forth.

4. The combination, in a machine of the character described, with the lower dies and means whereby they are successively presented to the tools, of the plurality of upper threading-dies, the same being radially expansible and contractible, and the gate whereon they are mounted, the pressure-block upon the gate whereby the blanks are seated in advance of their presentation to the threading-dies, and the vertically-reciprocated and intermittently-rotated gripper operating subsequent to the threading-dies, and whereby the work is removed from off the lower dies, substantially as set forth.



5. In a machine of the character described, the combination, with the intermittently-operated feeding-plate and the lower dies arranged in a circle upon said plate, each of said dies conformed to the shape of the article to be produced, of the reciprocating gate, the plurality of expansible and contractible threading-dies mounted upon and reciprocating with said gate, the gripper vertically operated by said gate, and means independent of said gate whereby an intermittent rotation is imparted to said gripper in addition to its vertical movement, substantially as and for the purpose specified.

6. The combination, in a machine of the character described, with the lower dies and the rotary plate whereon they are mounted, of the gate and a plurality of threading-dies arranged thereon, each of said dies being slotted vertically as to its operative surface, whereby a radial expansibility is imparted thereto, and having an inclined surface, an inclined surface secured upon the gate and engaging said inclined surface on the dies, and a spring for retaining the parts in their normal relative positions except when operated by the descent of the gate, substantially as and for the purpose set forth.

7. In a machine of the character described, the combination, with the lower dies and the means for operating them, of the dies upon the reciprocating gate, each die having a series of slots therein whereby an expansive and contractile action is imparted thereto, a wedge for effecting the radial action of the die-jaws, and a rotating and vertically-movable gripper for the removal of the work subsequent to the action of the dies, substantially as specified.

8. In a machine of the character described, the combination, with the reciprocating gate, the tools secured thereon, and the lower dies mounted beneath said gate, of the gripper and a vertical shaft upon which it is secured, a transverse shaft geared to said vertical shaft, a constantly-rotating band-wheel, and a clutch for connecting said transverse shaft with said band-wheel, substantially as set forth.

9. In a machine of the character described, the combination, with the reciprocating gate, the dies carried thereby, and the lower dies arranged beneath the gate, of the vertical shaft and the gripper arranged thereon, a short hollow shaft splined to said vertical shaft, a transverse shaft geared to said hollow shaft, a constantly-rotating band-wheel, a clutch splined to said transverse shaft, and a wedge operated independent of the band-wheel and in proper time with the gate, whereby intermittent engagement is effected between said band-wheel and the transverse shaft, as set forth.

10. The combination, in a machine of the character described, with the reciprocating gate and dies and the lower dies arranged beneath the gate, of the vertically and axially movable gripper-shaft and the gripper carried thereby, an independently-operated band-wheel, a clutch whereby the motion of the said band-wheel may be imparted to the gripper-shaft, and means operated in time with the gate and independent of the gripper-shaft, whereby the latter is intermittently engaged with the band-wheel, so as to be operated thereby, substantially as specified.

11. The combination, in a machine of the character described, with the main shaft, of the gate connected thereto and driven thereby, the dies upon the gate, the wedges whereby the radial movement is imparted to said dies, and the lower dies arranged beneath said gate, of the circular rack-plate whereon said lower dies are mounted, a reciprocating pawl adapted to engage and turn said plate step by step, a pivoted lever driven by the main shaft and adapted to actuate said pawl, and a rotary gripper operating in time with the dies, and whereby the finished work is removed, substantially as specified.

12. In a machine of the character described, the combination, with the gripper, its shaft, and the gate for imparting thereto a properly-timed vertical movement, of a hollow shaft splined to the gripper-shaft, a transverse shaft geared to the hollow shaft, an independently-rotated band-wheel, a clutch splined to said transverse shaft and carrying a friction-disk, and a sectoral wedge operated from the main shaft, and whereby the clutch is moved into engagement with the band-wheel, substantially as set forth.

13. The combination, in a machine of the character described, with the rotating feed-plate, the lower dies mounted thereon, and means for imparting properly-timed step-by-step rotation to the plate, of the reciprocating press-gate, a plurality of vertically-slotted dies whose operative surfaces are out of coincidence relative to the work movably arranged upon said gate, and wedges arranged in said dies and secured to the gate, whereby a radial movement may be imparted to their operative faces in connection with the downward stroke of the gate, substantially as set forth.

14. The combination, in a machine of the character described, with the centrally-pivoted feeding-plate and its dies and the ratchet-and-pawl mechanism, whereby a step-by-step movement is imparted thereto, of the reciprocating press-gate, a plurality of vertically-slotted dies arranged and carried thereon and movable relative thereto, and means for imparting to the sections of said dies a radial movement, a spring-cushioned presser-block, also carried by said gate, a gripper adapted to be operated by said gate, and means disconnected from said gate, whereby in addition to its vertical movement an intermittent axial rotation is imparted thereto, substantially as set forth.

15. In a machine of the character described, the combination, with a plurality of lower dies, each having a surface conformed to the shape of the finished article, and means for moving said dies step by step for presentation to the upper dies, of a reciprocating gate and a series of expansible and contractible dies mounted thereon, said dies being arranged with the interruptions between their operative surfaces out of coincidence, substantially as and for the purpose specified.

16. In a machine of the character described, the combination, with a plurality of lower dies, each having an operative surface conformed to the shape of the article to be produced, of a gate and means for reciprocating it relative to the said lower dies, an upper die having an interrupted operative surface, and means for imparting to said die an expansive and contractile movement, and a second upper die, also having radial movement, both said upper dies being carried on the gate, and the interruptions between the operative surfaces of the last-named upper die being out of coincidence with the interruptions between the surfaces of the first-mentioned upper die, whereby work having a continuous finished surface may be produced, substantially as specified.

411,157. BOTTLE OR SIMILAR ARTICLE. GEORG LEHNER and FRANZ MEMMER, Nuremberg, Germany. Filed Nov. 13, 1888. Serial No. 290,758. (Model.)

Claim.—1. As a new article of manufacture, a seamless bottle made of a single piece of metal having a neck B and wings a integral therewith, substantially as described.

2. As a new article of manufacture, the seamless bottle A, made of a single piece of metal and having the neck B and wings a integral therewith, and apertures b in said wings, substantially as described.

411,158. HAND-STAMP. MELCHIOR L. LOCHER, Sutton, Neb. Filed July 17, 1888. Serial No. 280,166. (Model.)

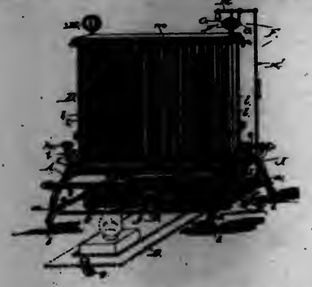
Claim.—1. In a hand-stamp, an outer casing having a fixed printing-surface secured thereto, in combination with a series of rotating wheels within the casing, independent printing-dies carried by said wheels, vertically-moving plungers for removing the dies from engagement with the wheels, and means for returning the dies into position, substantially as described.

2. In a hand-stamp, an outer casing having slots formed in its front service and a printing-surface fixed to its lower end, in combination with rotating wheels within the casing, independent printing-dies removably secured thereto, vertically-moving plungers for removing the dies from the wheels, means for returning the dies into position on the wheels, and finger-pieces connected with the plungers and projecting through the casing, whereby said plungers are actuated, substantially as described.

3. In a hand-stamp, the casing having the curved lower face, a curved printing-surface fixed to said curved face, an ink-roller frame having an inking-roller and curved slotted arms pivoted upon a shaft journaled in the casing, vertically-moving arms slotted on said shaft and provided with pins working in the curved slots of the arms, whereby the ink-roller frame is moved out of engagement with the curved printing-surface, and springs for returning the frame to its normal position beneath the printing-surface, substantially as herein described.

4. The combination, with the casing having the slot *c*, the walls of which are provided with grooves or guides 10, of rotating wheels within the casing, independent printing-dies removably secured to said wheels, plungers for removing the dies and projecting them through the slotted casing, and means for retracting the dies, said dies being provided with side wings 2, adapted to engage the grooves in the walls of the slot, substantially as herein described.

5. In a hand-stamp, the casing and the transverse shaft *d*, in combination with the radially-slotted disks thereon, vertically-moving plungers, the independent printing-dies fitted in the radial slots in the disk and adapted to be removed therefrom by the plungers, said dies having projections 5, and the vertically-moving plates H, connected with the plungers and having projections *p*, adapted to engage the projections on the dies to retract said dies when the plungers are moved upward, substantially as herein described.

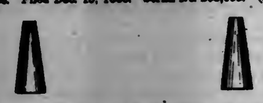


6. The casing, the transverse shaft, the slotted disk thereon, and the independent printing-dies fitted in the slotted disk and provided with the projection 5 and notch 6, in combination with vertically-moving plungers having their lower ends adapted to force the dies out of the slots in the disks, vertically-moving slotted plates H, connected with the plungers and provided with spurs or projections *p*, which engage the notches in the dies to be projected and for returning said dies into position, the open-end ring 7, fitted in the notches in the remaining dies to hold the latter in position on the disk, and means for rotating the disks to bring new dies into position beneath the plungers, substantially as herein described.

7. In a hand-stamp, the casing, with its fixed printing-surface, the transverse shaft, the slotted disks F thereon, the independent printing-dies fitted to said slotted disks, means for holding the dies on the disks, vertically-moving plungers for withdrawing the dies from the disks, and slotted vertically-moving plate H, connected with the dies and operated by the plungers to retract the dies and return them to their respective slots in the disks, in combination with a pivoted lever on plate L for temporarily holding the plungers and vertically-moving plates together, the disks M, having the cam portions *w* and shoulders *x*, the pins 14 and 15, carried by the plungers and operating the levers L, and also the disks M, whereby a partial rotation is imparted to the disks to move the dies into new positions, substantially as described.

8. In a hand-stamp, a casing, rotating wheels within provided with removable printing-dies, and means for retracting said dies when projected, in combination with the disks M, having the cam-surfaces *w* and shoulders *x*, and vertically-moving plungers for projecting the dies, said plungers being provided with pins for engaging the cam-

surfaces thereon, whereby a partial rotatition of the disks is effected to move the dice into new positions, substantially as herein described.



411,159. PORTABLE STEAM-RADIATOR. JOHN C. MACKEY, Detroit, Mich. Filed Jan. 16, 1889. Serial No. 296,712. (No model.)

Claim.—1. The combination of the skeleton base having the transverse supporting-rods *e*, a plate or shelf pivoted to one of said rods at one side and supported at its free end upon the opposite rod, a caster at the free end of the plate or shelf, and a heater adapted to be supported upon said plate, substantially as described.

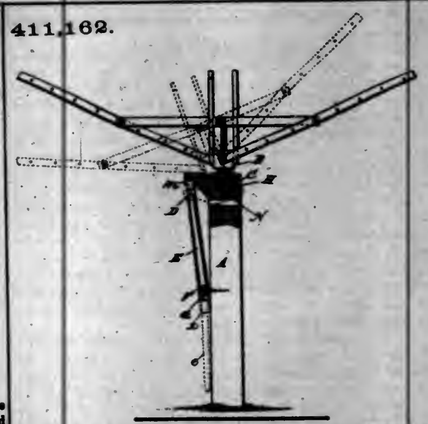
2. The skeleton base, the lamp-supporting plate having a raised rib, and the lamps supported on the plate between the inner walls of the rib, in combination with a curved reflector having its lower end confined between the rib and body of the lamp and its upper end curved or hook-shaped, whereby it may be fitted over the foot-rail, substantially as herein described.

411,160. SPECULUM. JAMES A. MALONEY, Washington, D. C., assignor, by direct and mesne assignments, to Michael J. Colbert, trustee, same place. Filed Dec. 15, 1888. Serial No. 293,693. (No model.)

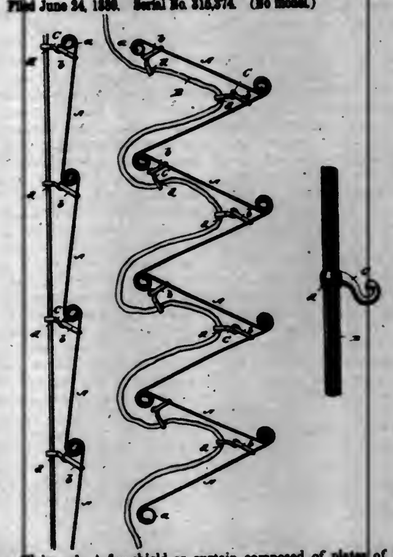
Claim.—1. As a new article of manufacture, a surgical instrument for entering the natural orifices of the body, made of paper stiffened, substantially as described.

2. As a new article of manufacture, a surgical instrument for entering the natural orifices of the body, made of paper stiffened and coated with a preservative material, substantially as described.

411,161. FLOATING LIFE-LINE. EDWARD MAYNARD, Brooklyn N. Y. Filed May 23, 1889. Serial No. 311,812. (No model.)



Claim.—The life line or hawser having a core of short cylinders of cork or similar wood with the strands around and inclosing the same, substantially as set forth.



411,162. CLOTHES-REEL. HARRY G. MILLER, Winona, Minn. Filed Nov. 28, 1888. Serial No. 291,703. (Model.)

Claim.—The tilting clothes-reel herein described, consisting, essentially, of the standard having its upper end forked, the block C, having a vertical socket and a lateral arm journaled in the fork of the standard, the center piece B, carrying clothes-supporting arms and having its lower vertical stem provided with an annular groove, the pin passing through the block, and also the groove in the stem of the center piece, the arm D, pivoted at one end to the lateral branch of the tilting block, and the hand-lever pivoted to the lower end of the arm D and also pivoted to the standard, whereby the reel may be locked in a tilting position and manipulated, substantially as specified.

411,162.

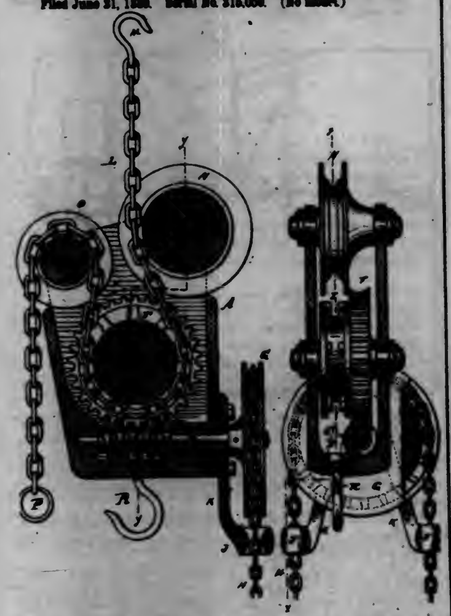
411,163. FIRE-CURTAIN. HARRY G. MILLER, Winona, Minn. Filed June 24, 1889. Serial No. 315,374. (No model.)

Claim.—1. A fire shield or curtain composed of plates of non-combustible or fire-proof material, the said plates being hinged together, and wire or cable connected to the rear sides of the plates and adapted to fold with the plates and unfold to sustain the plates in an open position, substantially as specified.

2. A fire-proof curtain composed of a series of plates of non-combustible or fire-proof material, a wire or cable secured to the upper portion of each plate, and suitable means for connecting the said cable to the plates, substantially as specified.

3. In a fire-proof curtain, the combination of plates of fire-proof or non-combustible material hinged together by a close joint, eyes secured to the upper portion of each plate, a wire or cable, and hooks carried by the said wire or cable and adapted to engage the eyes in the plates, substantially as specified.

411,164. NOSE-PAD FOR EYEGLASSES. JOHN P. MOLITOR, Vallejo, Cal. Filed Jan. 28, 1889. Serial No. 297,823. (No model.)



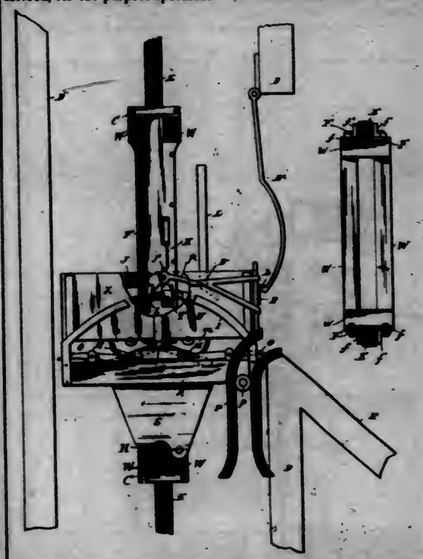
Claim.—1. A cushion-pad for the nose-bearings of eyeglasses, consisting of a soft-rubber tube *c*, having a longitudinal channel or depression *c* in its bearing-face, substantially as described.

2. A detachable cushion-pad for the nose-bearings of eyeglasses, consisting of a soft-rubber tube *c*, having a slit *i* along its back, so that it can be opened and clasped upon the bars or springs *b*, substantially as above described.

3. The cushion-pad *c*, for eyeglasses, made of soft rubber in the form of a tube and having a longitudinal slit *i* on one side and a longitudinal groove or depression *c* in its opposite or bearing side, substantially as described.

411,165. HOISTING-GEAR. O. H. HOSE HOAK, Stamford, Conn. Filed June 21, 1889. Serial No. 315,030. (No model.)

Claim.—1. In a hoisting device, the combination, with a casing or frame, of a shaft journaled in the same and provided with a worm, a worm-wheel engaged with said worm, a sprocket-wheel made integral with the worm-wheel, guide-pulleys in said frame, a hoisting-chain passed over the sprocket-wheel in the frame and over the guide-pulleys, a sprocket-wheel fixed on the outer end of the worm-wheel shaft, and an endless hand-chain passed over said sprocket-wheel, substantially as set forth.



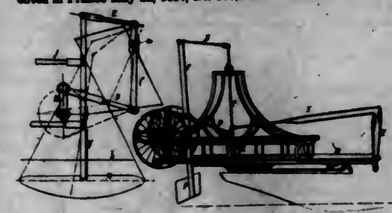
2. In a hoisting device, the combination, with a casing or frame, of a shaft journaled in the same and provided with a worm, a worm-wheel engaged with said worm, a sprocket-wheel made integral with the worm-wheel, guide-pulleys in said casing or frame, a hoisting-chain passed over said guide-pulleys and over the sprocket-wheel, a sprocket-wheel fixed on the outer end of the worm-shaft, an endless chain passed over said sprocket-wheel, and arms having guide-eyes on their ends for the endless hand-chain, substantially as set forth.

3. A hoisting-tackle composed of an exterior casing or frame, a worm in said casing, a sprocket-wheel and chain for turning the said worm, a worm gear meshing with said worm, a sprocket-wheel connected to said worm-wheel, a hoisting-chain passing over said sprocket-wheel, and suitable guide-rollers, a hook attached to the casing for supporting the load, the hoisting-tackle being adapted to climb with the load on the chain on operating the worm-gear mechanism by the hand-chain, substantially as set forth.

411,166. COAL-HOIST. JACOB CLOSS, Muscatine, assignor of one-half to John H. Burton, Columbus, Iowa. Filed Mar. 22, 1889. Serial No. 304,262. (No model.)

Claim.—1. In a coal-hoist, the combination, with the hoisting-frame, of the cage supported thereon and pivotally connected therewith to one side of a perpendicular line passing centrally through the said cage, substantially as and for the purpose described.

2. In a coal-hoist, the combination, with the hoisting-frame and the cage having the rail I, of the pawl engaging with the rail and locking the cage to the hoisting-frame, and the trip-bar for engaging with the said pawl to release it from the rail, substantially as described, for the purpose specified.



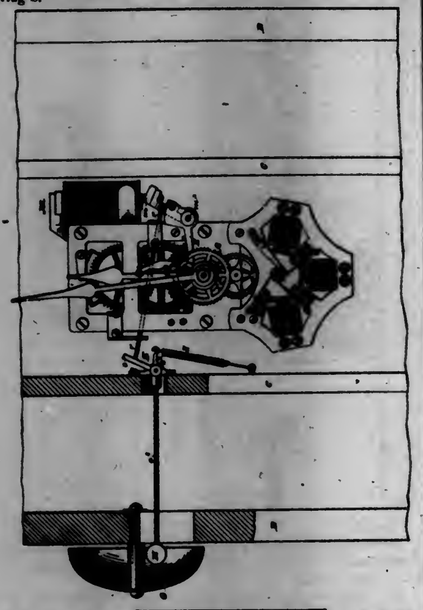
3. The combination, with the hoisting-frame and the tilting cage, of the keeper T, the stop U, and the pawl J, substantially as and for the purpose described.

4. The combination, with the hoisting-frame, the tilting cage, and the pawl for locking the cage to the frame, of the trip-bar for disengaging the pawl from the cage, the roller, and the curved guide for tipping the cage when released, substantially as set forth.

5. The combination, with the cage, of the locking-levers M and the foot-levers O, substantially as and for the purpose described.

6. The combination, with the tilting cage and the car having the stop-bar N, of the locking-levers M and the foot-levers O, substantially as described.

411,167. PADDLE HYDRO-MOTOR. EUGÈNE POMMAS, Rheims, France. Filed Dec. 7, 1887. Serial No. 257,945. (No model.) Patented in France May 28, 1887, No. 183,978.



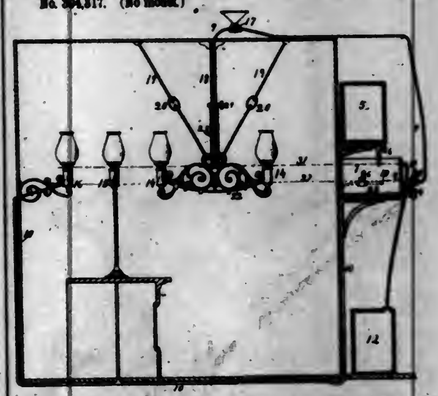
Claim.—In a hydro-motor, the combination, with a lever C, having a fixed fulcrum *a*, the bar E, articulated to the short arm of the lever C above said fulcrum, the bar D, articulated to the long arm of the lever C below said fulcrum, the bar F, articulated to the bars E D, said bar F extending downwardly below the bar D, and the bar D extending across the bar F and beyond the same, a crank to which the bar D is connected beyond the bar F, and a paddle upon the portion of the bar F below the bar D, substantially as specified.

411,168. GONG-STRIKING MECHANISM FOR SYNCHRONIZED CLOCKS. CHESTER H. POPE, Chicago, Ill., assignor to the Self Winding Clock Company, New York, N. Y. Filed May 3, 1889. Serial No. 309,490. (No model.)

Claim.—1. The combination, with a clock-train, a synchronizing mechanism, and an electro-magnet and armature for operating the same, of a gong G, a spring-retracted hammer, and a rod *r*, independent of the clock mechanism and extending from the hammer into the path of the said armature, as herein set forth.

2. The combination of a clock-train, the electro-magnet M, its armature *m*, the synchronizing device, as described, operated by said armature, the gong G, and the striking device therefor, consisting of the rod *r*, the pivoted lever E, carrying the hammer H, and the spring S.

411,169. ROTARY MEAT-TENDERER. JOHN G. SCHMIDT, Philadelphia, Pa. Filed Sept. 20, 1888. Serial No. 285,866. (No model.)



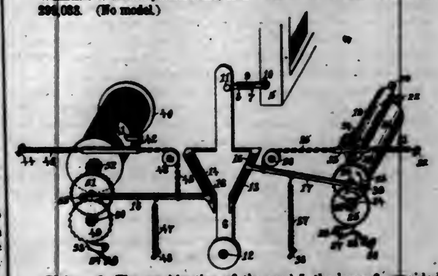
Claim.—1. The combination, with crushing-rolls journaled to standards, an apron with a serrated inner edge, a crank mounted on one of the journals of the lower roll, and scrapers arranged adjacent to said rolls, of a feeding device pivoted to said standards, substantially as and for the purposes set forth.

2. The combination, with end standards, two rollers journaled thereto and provided with knife-edged teeth arranged in rows with spaces between them, means, as described, for permitting of the actuation of said rollers, and scrapers disposed adjacent to said rollers, of a feeding device pivoted to said standards and normally engaging with the journals of the upper roller, substantially as and for the purposes set forth.

3. The combination of vertical end standards, two toothed rollers journaled thereto, scrapers arranged adjacent thereto, a crank mounted on a journal of the lower roller, a feeding device normally engaging with the journals of the upper roller and operating to rotate the same while feeding material between said rollers, and means, substantially as described, for causing the upper roller to again assume its normal operative position, substantially as and for the purposes set forth.

411,170. HYDROCARBON-LIGHTING DEVICE. THEODORE SCHUH and FREDERICK A. CODY, Rochester, N. Y. Filed Mar. 26, 1888. Serial No. 268,817. (No model.)

Claim.—1. The combination of a hydrocarbon-distributing reservoir having an opening at its top, an outlet-pipe entering the side thereof near its top, a reservoir and an overflow-receptacle, each provided with one screw-threaded aperture, and a stop-cock adapted to engage either of the said apertures, whereby the reservoir and receptacle are interchangeable.

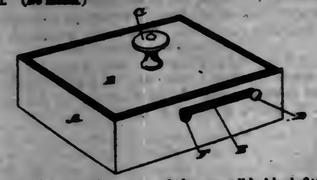


2. The combination, with a siphon-shaped hydrocarbon-distributing pipe, of a priming-cock located near the highest point of the siphon, and adapted to admit a tunnel.

3. The combination of two hydrocarbon-lamps and a hanger therefor comprising two telescoping pipes, one of which is provided with a set-screw, and two braces, each provided with a swivel screw-nut, a reservoir fixed on a level with the lamps, and a pipe connecting the said reservoir and lamps, substantially as shown and described.

411,171. SUBSTITUTE FOR GUTTA-PERCHA. CARL A. A. H. SEIBERT, Leipsic, Saxony, Germany. Filed Nov. 3, 1887. Serial No. 254,208. (No specimens.)

Claim.—A gutta-percha substitute consisting of a mixture of asphaltum, balsam of sulphur, and an easily-melting solid hydrocarbon, substantially as set forth.



411,172. LET-OFF AND TAKE-UP MECHANISM FOR LOOMS. WILHELM C. TAUBER, Centreville, R. I. Filed Feb. 7, 1889. Serial No. 298,033. (No model.)

Claim.—1. The combination of the reed 5, the lever 6, provided with slots 13 and 14, connected to the reed by the link 7, the rack-levers 17 and 18, the ratchet-gears 25 and 49, the followers 34 and 41, the springs 31 and 43, and the chains 35 and 45, operated by the followers to lift or lower the ends of the rack-levers 17 18 in the slots 13 14, substantially as herein shown and described.

2. The combination of the reed 5, the link 7, the lever 6, provided with the diverging slots 13 14, the rack-levers 17 18, the springs 37 47, the ratchet-gears 25 and 49, and the intermediate gearing connecting the ratchet-gears to the cloth-beam and warp-beam, respectively, the springs 31 and 43, the L-shaped links 33 and 42, provided with the followers 34 and 41, and the chains 35 and 45, the said chains connecting their respective links to the respective rack-levers, all substantially as herein shown and described.

411,173. COMBINED PENCIL-SHARPENER AND PAPER-WEIGHT. ALFRED THEISEN, San Francisco, Cal. Filed Jan. 3, 1889. Serial No. 295,941. (No model.)

Claim.—1. The exterior case and the reversible block fitting into the top of the case and provided with a pencil-sharpening knife or cutter upon its lower side, substantially as described.

2. A pencil-sharpening knife or cutter fixed to a block so as to reciprocate over a surface which is adapted to hold a pencil while being sharpened, in combination with a box or case to which said block is connected so as to be reversed into the case, substantially as described.

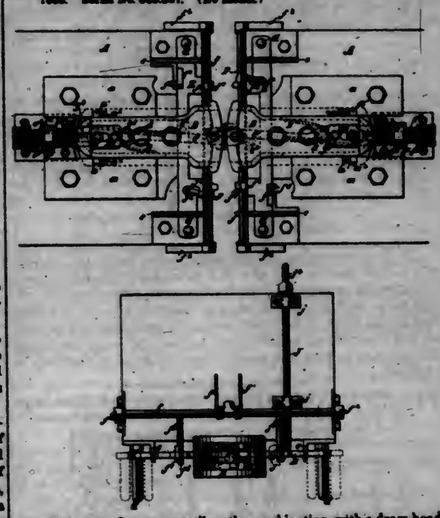
3. The block having an inclined hole made in one end, terminating in a slot upon the face of the block through which the point of the pencil may protrude, and a knife or cutter swiveled or fulcrumed to the face of the block, so as to be reciprocated across the point of the pencil, in combination with a box or case having slots in the sides, and trunnion-pins passing through said slots and attached to the block, so that the latter may be closed into the box or reversed for use, substantially as described.

4. The block having an inclined hole made in one end and terminating in a slot upon one of the faces of the block, in combination with an arm or lever having one end fulcrumed to the block at one side of the slot, and a knife or cutter and a file fixed to the lower side of the lever so as to pass over the slot through which the pencil protrudes with a drawing cut when the lever is moved, substantially as described.

5. The lever having the cutter and file fixed to its lower surface, having each of its ends projecting so as to rest upon the surface of the block over which the lever moves and prevent the knife or file from touching said surface, and having a fulcrum-pin passing through the lever at a point between the projecting ends, substantially as described.

6. The knife or cutter fixed to the swinging lever, having its edge bent or inclined toward the surface to which the lever is fulcrumed, and having the lower edge beveled, substantially as and for the purpose herein described.

7. The block having the inclined hole made in one end and terminating in an elongated slot upon its face, through which the point of the pencil may be protruded, in combination with a lever fulcrumed at one side and slightly behind the slot, and having a knife and file section fixed to its lower surface, so that the wood and lead of the pencil may be cut away, respectively, by the knife and file making a drawing cut over the point, substantially as described.



411,174. RIVET. JAMES J. UNDERHILL, Syracuse, N. Y., assignor to James L. Thomson & Co., same place. Filed May 10, 1887. Serial No. 237,719. (No model.)

Claim.—1. A rivet made from solid wire, provided with a head and two prongs, each having a rounded outer surface and a flat inner surface, said prongs being provided with cutting ends and made tapering widthwise from their junction to their cutting ends, and having a greater distance between the cutting ends of said prongs than their points of junction, substantially as and for the purpose set forth.

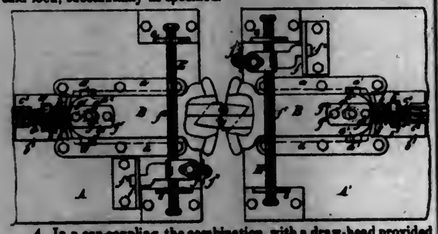
2. A rivet made from solid wire, provided with a head and two prongs, each having a rounded outer surface and a flat inner surface, said flat surfaces of said prongs being substantially parallel longitudinally to each other and to the rounded outer surface of said prongs, said prongs being provided with cutting ends and made tapering widthwise from their junction to their cutting ends, and having a greater distance between their extremities than their points of junction, substantially as and for the purpose specified.

411,175. CAR-COUPLING. WILLIAM C. WARNER, Paterson, N. J., assignor of one-half to Theodore Y. Kinne, same place. Filed Mar. 30, 1889. Serial No. 305,267. (No model.)

Claim.—1. In a car-coupling, the combination, with a draw-head, of a coupling-hook pivoted within the same, a spring acting on said coupling-hook to force it in one direction, a pull-rod extending upon both sides of said draw-head and adapted to contact with the coupling-hook to move the latter in one direction, and a lock for securing said pull-rod in a position into which it may be adjusted, substantially as specified.

2. In a car-coupling, the combination, with a draw-head, of a coupling-hook pivoted within the same, a spring for moving said coupling-hook in one direction, a pull-rod extending upon both sides of said draw-head and adapted to contact with the coupling-hook to move it in one direction, a rock-shaft, and an arm on said rock-shaft for locking said pull-rod in a position into which it may be adjusted, substantially as specified.

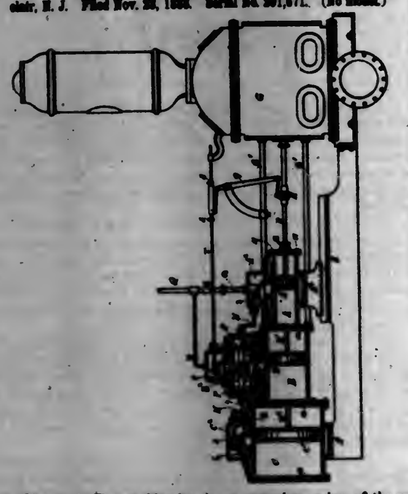
3. In a car-coupling, the combination, with a draw-head, of a coupling-hook pivoted within the same, a spring for moving said coupling-hook in one direction, a pull-rod extending to opposite sides of said draw-heads and adapted to contact with the coupling-hook to move it in one direction, a lock for securing said pull-rod in a position into which it may be adjusted, and a crank for causing the unlocking of said lock, substantially as specified.



4. In a car-coupling, the combination, with a draw-head provided with a shank upon its rear end, of a spring surrounding said shank and operating to force the draw-head forward, a coupling-hook pivoted within said draw-head and provided with a shank extending through the shank of the draw-head, and a second spring surrounding said shank of the coupling-hook beyond the spring first named and operating to draw said coupling-hook inwardly, substantially as specified.

411,176. CAR-COUPLING. WILLIAM C. WARNER, Paterson, N. J., assignor of one-half to Theodore Y. Kinne, same place. Filed July 10, 1888. Serial No. 317,973. (No model.)

Claim.—1. In a car-coupling, the combination, with a draw-head, of a coupling-hook pivoted within the same, a spring acting on said coupling-hook to force it in one direction, a pull-rod extending upon both sides of said draw-head and adapted to contact with the coupling-hook to move the latter in one direction, and a lock for securing said pull-rod in a position into which it may be adjusted, substantially as specified.

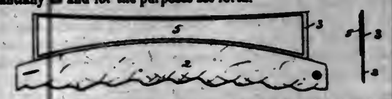


2. In a car-coupling, the combination, with a draw-head, of a coupling-hook pivoted within the same, a spring for moving said coupling-hook in one direction, a pull-rod extending upon both sides of said draw-head and having a portion adapted to contact with the coupling-hook to move it in one direction, said pull-rod also constituting a rock-shaft, an arm, and a notched piece with which said arm engages to lock said combined pull-rod and shaft against longitudinal movement, substantially as specified.

3. In a car-coupling, the combination, with a draw-head, of a coupling-hook pivoted within the same, a spring for moving said coupling-hook in one direction, a pull-rod extending to opposite sides of said draw-head and adapted to contact with the coupling-hook to move it in one direction, a lock for securing said pull-rod in a position into which it may be adjusted, and a crank for causing the unlocking of said lock, substantially as specified.

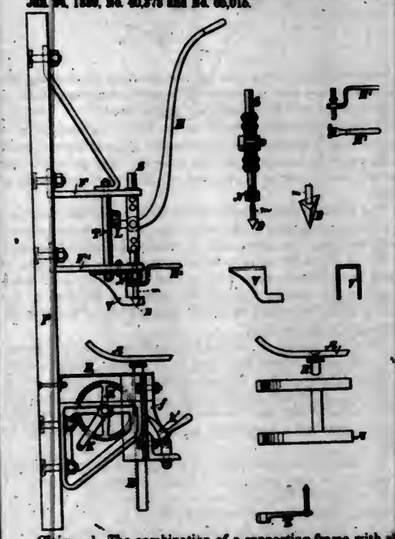
4. In a car-coupling, the combination, with a draw-head provided with a shank upon its rear end, of a spring surrounding said shank and operating to force the draw-head forward, a coupling-hook pivoted within said draw-head and provided with a shank extending through the shank of the draw-head, and a second spring surrounding said shank of the coupling-hook beyond the spring first named and operating to draw said coupling-hook inwardly, substantially as specified.

411,177. PUMPING-ENGINE. FREDERICK M. WHEELER, Montclair, N. J. Filed Nov. 22, 1888. Serial No. 291,671. (No model.)



Claim.—1. The combination, in an expansion-engine, of the cylinders A B C, in line with each other, the smaller cylinder A being at one end and the larger cylinder C at the other end of the range, the piston-rods passing through the cylinders and being provided with pistons in the respective cylinders, the rear end 10 of the cylinder C being removable, the front head 11 of the cylinder A being removable, and the rear head 12 of the cylinder A being removable from the cylinder B, and supports for the cylinder A, that allow the same to be moved away from the cylinder B to give access to the piston B' for packing and repairing the same, substantially as set forth.

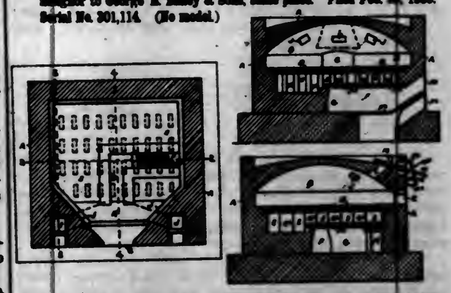
2. The cylinders A B C, axially in line with each other, the piston-rods, and the respective pistons, in combination with the valve-chests, valves, valve-rods, and the connecting-wrists, and a secondary valve and tappets, and valve-moving pistons for giving direct motion simultaneously to all three valves in the expansion-engine, substantially as set forth.



411,178. COLLAR FOR WOOLEN SHIRTS. FREDERICK R. WHITCOMB, Minneapolis, Minn. Filed Jan. 8, 1889. Serial No. 295,709. (No model.)

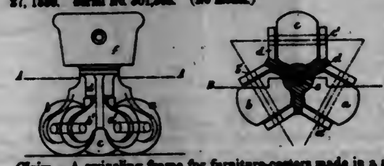
Claim.—1. In a shirt, the combination, with the shirt-band, of a soft woolen collar connected to said band and a stiff fabric secured to the under face of the collar, with its edge adjacent to the shirt-band curved, as shown, and lying back from the juncture of the collar to the band to leave the juncture between the collar and band soft and pliable, and to support the collar and hold the band distended, substantially as and for the purposes set forth.

2. In a shirt, the combination, with the shirt-band and collar formed of a soft woolen fabric, of a collar-support composed of a stiff fabric secured to the under side of the collar back from its edges, so as to leave a flexible margin between the edge of the support and the edge of the collar, substantially as and for the purpose set forth.



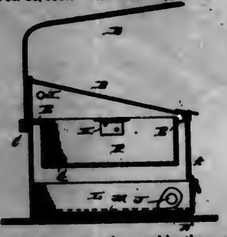
411,179. BUNG-EXTRACTOR. OSCAR WIEGAND, Remscheid, Prussia, Germany. Filed June 4, 1889. Serial No. 312,071. (No model.) Patented in Germany Aug. 12, 1888, No. 46,612, and in Austria-Hungary Jan. 24, 1889, No. 40,276 and No. 66,016.

Claim.—1. The combination of a supporting-frame with shaft S, and a spike-head having angular spindle *m*, adapted to be coupled to the shaft, and with lever H, pivoted to the frame and adapted to raise the shaft, and with a forked lever H', adapted to engage and revolve angular spindle *m*, substantially as specified.



2. The combination of platform A with a rack R, supporting the platform, a toothed wheel Z, and a spring-pawl *p'*, engaging the rack, a crank K, for revolving the toothed wheel, and with a sliding spindle having a three-cornered spike-head and supported in a frame above platform A, and with a pair of levers for imparting vertical and rotary motion to said spindle, substantially as specified.

411,180. BAKER'S OVEN. GEORGE E. BAILEY, Mansfield, Mass., assignor to George E. Bailey & Sons, same place. Filed Feb. 20, 1889. Serial No. 301,114. (No model.)

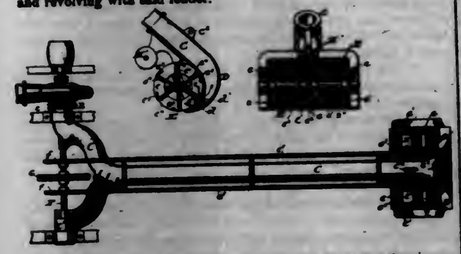


Claim.—The combination, with a baker's oven, of an oven-chamber B, closed on all sides and having a door C to enter it and a floor D, an air space or chamber E, located directly under and embracing oven-floor D, which makes a roof or top thereto and closed on all sides and at all points to the oven-chamber, a furnace F, under the floor of air-chamber E, and closed at all points to said chamber, a furnace-flue H J, leading from furnace and opening to upper portion of oven-chamber, a damper J', to open and close flue H J, an oven and escape-flue L, leading from upper portion of oven-chamber, and a damper M, to open and close flue L, substantially as described, for the purposes specified.

411,181. CASTER. EDWIN BARBER, London, England. Filed Feb. 27, 1889. Serial No. 301,262. (No model.)

Claim.—A swiveling frame for furniture-casters made in a single piece and having integral therewith three pairs of branches or arms, each provided with bearing-holes adapted to support the horizontal axis of a roller, the holes in each pair being in the same horizontal plane and in a line inclined to those in the other pairs, as set forth.

411,182. FOOT-WARMER. CHARLES H. BICKFORD and CHARLES SCHEUR, Mount Vernon, Ind., assignors, by mesne assignments, to said Scheur. Filed Feb. 26, 1889. Serial No. 301,446. (No model.)



Claim.—1. In a foot-warmer, the combination, with the casing having a cleat on its rear side, of the hood having its lower edge engaging said cleat and extending upward and over the casing, as set forth.

2. The combination, with the casing containing the source of heat, of the hood detachably connected thereto and constructed of a single piece of sheet metal which extends upward from the back and then forward over the casing and out of contact therewith, said hood sliding in ways secured to the casing, as set forth.

411,183. DREDGING APPARATUS. ALPHEUS B. BOWERS, San Francisco, Cal. Original application filed Dec. 9, 1876. Divided and another application filed Apr. 27, 1885. Again divided and this application filed May 17, 1887. Serial No. 238,512. (No model.)

Brief.—It consists, mainly, of a non-rotating excavating implement attached to a suction-pipe, in combination with a suitable feeder projecting below said implement to enable it to ride over obstructions. It also consists, in part, of the combination, with said implement and pipe, of a rotary feeder; also, in the combination, with said implement, pipe, and rotary feeder, of an auxiliary rotary excavator secured to and revolving with said feeder.

Claim.—1. In combination, a suction-pipe provided with a screening device that admits spoil to said pipe, but excludes substances too coarse to pass through the raising and discharging apparatus, and a rotary excavator having its axis outside of said device, said excavator being provided with cutting edges or blades whose spoil is delivered to and through said device to said pipe.

2. In combination, a suction-pipe provided with a screening device that admits spoil to said pipe, but excludes substances too coarse to pass through the raising and discharging apparatus, and a rotary excavator provided with scraping-blades that deliver their spoil to and through said device to said pipe.

3. In combination, a suction-pipe provided with bars that admit spoil to said pipe, but exclude substances too coarse to pass through the raising and discharging apparatus, and a rotary excavator having its axis outside of said bars, said excavator being provided with cutting edges or blades whose spoil is delivered between said bars to said pipe.

4. In combination, a suction-pipe provided with a screening device that admits spoil to said pipe, but excludes substances too coarse to pass through the raising and discharging apparatus, and a rotary excavator provided with scrapers and cutting edges or blades that deliver the spoil through said device to said pipe.

5. A suction-pipe having its lower end flattened, in combination with a rotary excavator outside of and its axis transverse to said pipe, said excavator being provided with cutting edges or blades that deliver their spoil outward to said pipe.

6. A suction-pipe having its lower end flattened, in combination with a rotary excavator outside of and its axis transverse to said pipe, said excavator being provided with scraping-blades that deliver their spoil outward to said pipe.

7. A suction-pipe having its lower end flattened, in combination with a rotary excavator outside of and its axis transverse to said pipe, said excavator being provided with scrapers and cutting-edges that deliver their spoil outward to said pipe.

8. A suction-pipe having its lower end flattened and curved, in combination with a rotary excavator outside of and its axis transverse to said pipe, said excavator being provided with cutting edges or blades that deliver their spoil outward to said pipe.

9. A suction-pipe having its lower end flattened and curved, in combination with a rotary excavator outside of and its axis transverse to said pipe, said excavator being provided with scraping-blades that deliver their spoil outward to said pipe.

10. A suction-pipe having its lower end enlarged, flattened, and curved, in combination with a rotary excavator outside of and its axis transverse to said pipe, said excavator being provided with scrapers and cutting-edges that deliver their spoil outward to said pipe.

11. In combination, a suction-pipe, rotary excavator, endless actuating-chain, and sheaves H H', for holding and guiding said chain.

12. The rotary excavator E, provided with the scrapers *e'*, substantially as and for the purpose described.

13. A suction-pipe provided with a non-rotating excavating implement and a rotary feeder secured to and in combination with an auxiliary rotary excavator.

14. In combination, a suction-pipe and a rotary excavator secured to the mouth thereof, said excavator being provided with cutting edges or blades and having its axis outside of and transverse to said pipe.

15. A suction-pipe provided at or near its mouth with a fixed or non-rotating excavating device, and a feeder projecting down beyond said device to prevent this device from catching against obstructions.

16. A suction-pipe provided with a scraper, in combination with a device projecting down beyond said scraper to prevent this scraper from catching against obstructions.

17. A suction-pipe provided with a fixed or non-rotating excavating implement, and a rotary feeder projecting down beyond this implement to prevent said implement from catching against obstructions.

18. A suction-pipe provided with a screen, a scraper, and a feeder projecting down beyond this scraper to carry said scraper over obstructions.

19. A suction-pipe provided with a screen, scraper, and a rotary feeder projecting down beyond the scraper.

20. In combination, a dredge-boat, a non-rotating suction-pipe constructed and arranged to swing in a vertical plane in line with or parallel with the line of the longitudinal axis of said boat, and a rotary excavator secured to the pipe and provided with peripheral longitudinal excavating-edges that deliver their spoil outward to said pipe.

21. In combination, a dredge-boat, a non-rotating suction-pipe constructed to vary the depth of excavation by the raising or lowering of its outer end in a vertical arc, and a rotary excavator secured to said outer end and provided with longitudinal peripheral excavating-edges that deliver their spoil outward to said pipe.

22. A rotary excavator having excavating devices with outward delivery, and feeders at the sides of the cutting-faces and intermediate between said sides along said cutting-faces to prevent said devices from catching against obstructions.

411,184. STOVE-GRATE. JOHN F. BRAYER, Rochester, N. Y., assignor to the Cooperative Foundry Company, same place. Filed Mar. 6, 1888. Serial No. 302,072. (No model.)

Claim.—1. The combination, with the grate-body composed of inclined bars connected at their lower ends slightly below their upper sides, of a rotary section consisting of a central web having a series of cutting-fingers extending around the under side in the form of separate ribs, substantially as described.

2. The combination, with a grate and a support therefor, of a removable section forming a part of said grate and supported upon it, having an extension co-operating with the under side of the grate-support and holding the grate in position thereon, substantially as described.

3. The combination, with a grate and a support therefor, of a rotary grate-section supported on the grate, having a journal-extension passing beneath the grate-support and locking the grate in position thereon, substantially as described.

4. The combination, with a grate and a support therefor on which it may be oscillated, of a section adapted to be rotated supported on the grate, having a journal-extension passing beneath the support and holding the grate in position thereon, substantially as described.

5. The combination, with a grate and a support therefor, of a removable rotary section supported on the grate, having a journal-extension passing beneath the support and holding the grate in position thereon, substantially as described.

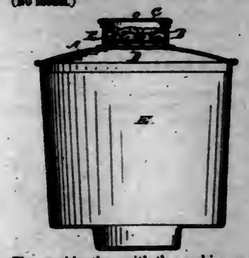
6. The combination, with a grate and a support therefor, of a rotary section supported in open bearings on the grate, having a journal-extension adapted to be passed beneath the grate-support, and a removable spindle or shaft co-operating with said section, by which it may be operated, substantially as described.

7. The combination, with a grate mounted on a support and capable of being oscillated thereon, a rotary damping-section mounted on the grate, having an extended operating shaft or spindle, of a movable plate having a recess for co-operating with the spindle when the section is to be rotated, preventing the oscillation of the grate, but adapted to be moved out of the way, permitting the oscillation of the grate when desired to shake the fire, substantially as described.

8. The combination, with a grate capable of being oscillated, a rotary section thereon having an extended operating-spindle, of a plate pivoted on the stove-body, having a recess therein adapted, when in one position, to co-operate with the said spindle and prevent oscillation, substantially as described.

9. The combination, with a rotary grate-section having an operating spindle or shaft and arranged to be rotated on the axis of said spindle, of an operating-handle adapted to be applied to the spindle end, having a projecting portion, and a stationary flange or projection with which the projection on the handle co-operates during the rotation of the grate-section for preventing the removal of the handle until it is returned to first position, substantially as described.

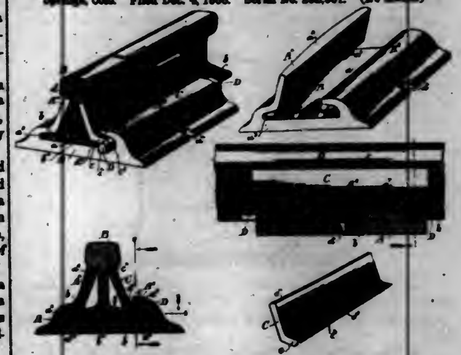
10. The combination, with a rotary grate-section having an operating spindle or shaft and arranged to be rotated on the axis of said spindle, of an operating-handle adapted to be applied to the spindle end, having the segmental flange, and the stationary flange or projection with which the one on the handle engages during the rotation of the grate-section, preventing the removal of the handle until returned to first position, substantially as described.



11. The combination, with an oscillating grate having a rotary section thereon, of a movable latch or projection engaging a movable portion of the grate for preventing its oscillation when the section is to be rotated, substantially as described.

12. The combination, with the grate-section having extended spindle and capable of being oscillated laterally and of being rotated on its axis at any point, of a movable plate having a recess co-operating with the spindle when the section is to be rotated and adapted to be moved out of the way to permit the section to oscillate to shake the fire, substantially as described.

13. The combination, with a grate capable of oscillation laterally, and a rotary section mounted thereon having the extended spindle and capable of rotation at any point, of a movable plate having a recess co-operating with the spindle when the section is to be rotated and adapted to be moved out of the way to permit the section to be oscillated to shake the fire, substantially as described.



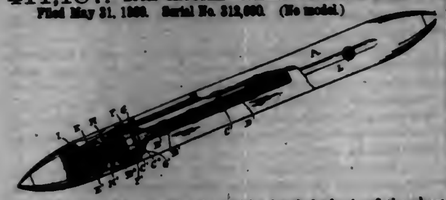
14. The combination, with the grate and a support therefor, of a rotary section supported in open bearings in the grate, having a leg, and a journal-extension adapted to be passed beneath the grate-support, and a removable plate with which said leg co-operates to prevent endwise motion of the section sufficient to release the journal-extension from the grate-support, substantially as described.

411,185. COVER FOR COOKING-VESSELS. CHARLES H. CHENEY and HORACE W. COOK, Boston, Mass. Filed Jan. 9, 1889. Serial No. 295,977. (No model.)

Claim.—The combination, with the cooking-vessel cover A, having a central opening, and a vertical annular flange B, secured around the latter and forming part of the box hereinbefore specified, of the charcoal-supporting grating D, placed within said box, and the detachable cap C, applied to the latter and having openings *c* for escape of deodorized fumes, as shown and described.

411,186. LOCK-RAIL JOINT. PRESTON C. DOUBTFIRE, Colorado Springs, Colo. Filed Dec. 4, 1888. Serial No. 292,601. (No model.)

Claim.—1. The combination, with the track-rails, of a chair having a horizontal base supporting and bearing against the bottoms of the rails and provided on each side with a longitudinal recess opposite the flanges of the rails, of two arms embracing the rails with their upper edges resting against the under surfaces of the head of the rail and having their lower edges resting upon the rail-flanges, and a wedge inserted in said recess bearing against the rail-flange and the lower edge of said arm, whereby said rails are locked in position in said chair.



2. The combination, with the track-rails, of a chair having a flat base to support the rails and provided on each side with longitudinal recesses a^2 a^3, opposite the flanges of the rails, of an arm integral with the chair having its upper edge resting against the under surface of the rail-head, of a second and shorter arm on the opposite side of the rails, an arm or plate adapted to engage at its upper edge the under side of the rail-head and at its lower edge to engage beneath said short arm, and a wedge adapted to fit in the recess a^3 and bear against said short arm, the flanges of the rail, and the arm *c* of the plate C, substantially as described.

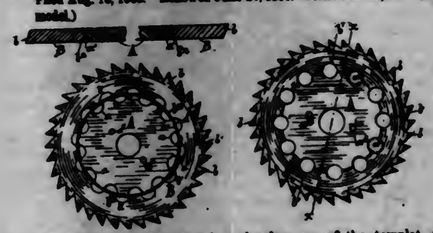
3. The combination of the L-shaped plate C, having its short member *c* wedge-shaped and provided upon its upper surface with corrugations c^3.

4. The combination, with the chair A, having recesses a^2 and a^3 and arms A' A^3, of the plate C, provided with grooves c^3 on the upper surface of its short wedge-shaped member *c*, grooves *c* in the upper surface of the said recesses, and a pin E, to engage said grooves c^3 and *c*, substantially as described.

5. The combination, with the track-rails, of a chair A, having supporting-base *a*, and provided on each side with longitudinal flanges A' C, embracing the rails and with their upper edges resting against the under surface of the rail-head, said arm A' being integral with the chair A, said arm resting at its lower end in the recess a^2, and being provided with corrugations c^3, which engage similar corrugations in the arm A^3, and a wedge D, located in said recess a^3 and bearing against the flanges *b* of the rails B and against the edge of the arm *c*, substantially as described.

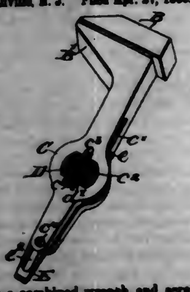
411,187. LOOM-SHUTTLE. SUMNER A. DUDLEY, Taunton, Mass. Filed May 31, 1888. Serial No. 313,990. (No model.)

Claim.—1. The combination, with shuttle-body A, of the short stiff spindle B, bobbin-holding catches E F G and E' F' G', and spiral spring I, substantially as and for the purposes set forth.



2. The combination, with the base K of the shuttle, of the bobbin-holding catches E F G and E' F' G', and spiral spring I, said parts being constructed and relatively arranged for joint operation substantially as and for the purposes set forth.

411,188. TIDY-HOLDER. FRANK A. GERA and JOHN H. GUELL, Bellevue, Ohio. Filed June 26, 1889. Serial No. 315,491. (No model.)

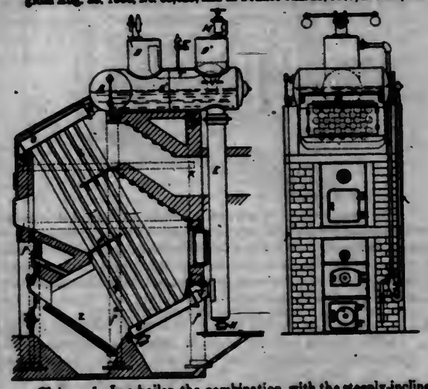


Claim.—The tidy-holder described, formed of a single piece of wire bent to form the loop *a*, the horizontal portions *b*, the vertical arms *c*, vertical inclined arms *d*, and the coiled free ends, substantially as herein shown and described.

411,189. CIRCULAR SAW. SYLVESTER P. GEST, Nashville, Tenn. Filed Aug. 16, 1888. Renewed June 27, 1889. Serial No. 315,731. (No model.)

Claim.—The combination, in a circular saw, of the templet A, having the scallops *a* and the grooves *a'*, with the ring B having the teeth *b*, the scallops *b'*, and the tenons b^3, the said scallops *a* and the said tenons b^3 being so constructed that the said tenons can be passed through the said scallops *a*, when the ring B is placed upon or removed from the templet A, for the purpose of renewing, altering, or replacing the tooth-section of the saw without removal or renewal of the templet.

411,190. COMBINED WRENCH AND SCREW-DRIVER. ISAAC A. HAZEN, Smithville, N. J. Filed Apr. 27, 1889. Serial No. 308,802. (No model.)



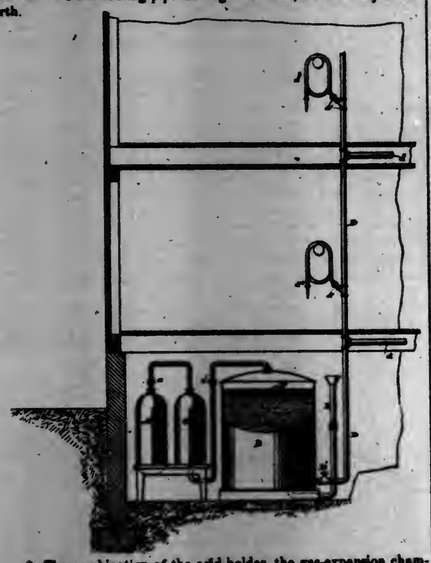
Claim.—1. In a combined wrench and screw-driver, the combination of a post carrying a lower jaw and having a longitudinal slot therein, a handle carrying an upper jaw and having a longitudinal cavity and slot therein, a recess in the said handle intersecting the said cavity, a thumb-nut in the said recess engaging the said post, an interior groove in the said nut, and a screw-driver having a lug upon its edge adapted to pass through the said interior groove, the said screw-driver being contained in the said slots in the post and handle, as and for the purposes described.

2. In a combined wrench and screw-driver, the combination of a post carrying a lower jaw and having a longitudinal slot therein, a handle carrying an upper jaw and having a longitudinal cavity and slot therein, a recess in the said handle intersecting the said cavity, a thumb-nut in the said recess engaging the said post, an interior groove in the said nut, and a screw-driver having a lug upon its edge adapted to pass through the said interior groove, the said screw-driver being contained in the said slots in the post and handle, as and for the purposes described.

3. In a combined wrench and screw-driver, the combination, with an upper and a lower jaw B' and B, respectively, of a rounded post A, attached to the said lower jaw B, a longitudinal slot *a'* in the said post A and screw-threads *a* thereon, a handle C, attached to the said upper jaw B', a longitudinal cavity *c* and slot c^2 in the said handle C, a recess c^3, extending from side to side of the said handle and intersecting the said cavity *c*, a thumb-nut D, having an interior groove *d*, contained within the recess c^3 and engaging the screw-threads *a* on the post A, a screw-driver E, resting within the slots *a'* and c^2 of the post A and handle C, respectively, a nose *e* and a lug *e'* on the said screw-driver, a slot e^2 in the screw-driver, a screw e^3 in the handle C passing through the said slot e^2, and marks d^2 and e^4 upon the nut D and handle C, respectively, all as and for the purposes described.

411,191. STEAM-BOILER. PROSPER HAMEUR, Brussels, Belgium. Filed July 8, 1889. Serial No. 316,210. (No model.) Patented in Belgium Aug. 26, 1889, No. 83,095, and in France Jan. 28, 1889, No. 195,700.

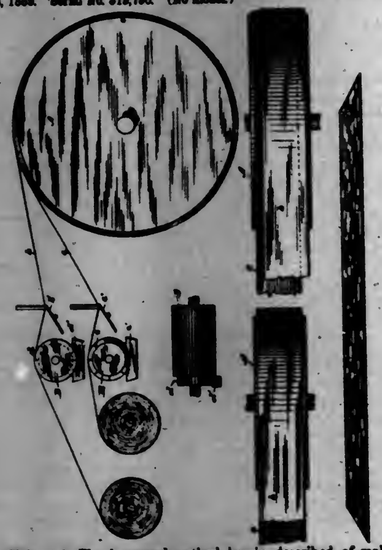
Claim.—1. In a boiler, the combination, with the steeply-inclined water-tubes and the tube-boxes at each end of the tubes, of a receiver formed in two parts having their respective steam and water spaces in free communication with each other, one of the said parts being connected to the upper tube-box and the second said part being connected with the lower tube-box, and a steam-outlet connected to the steam-space of the said second part but not directly communicating with the steam-space of the said first part of the receiver, substantially as set forth.



2. In a boiler, the combination, with the steeply-inclined water-tubes and the tube-boxes at the ends of the tubes, of a receiver formed in two parts placed at right angles with each other and having their respective steam and water spaces in free communication with each other, the internal steam-pipe and dip-funnel, a chamber connecting the upper tube-box to one part of the receiver, a pipe connecting the second part of the receiver with the lower tube-box, and a steam-outlet connected to the steam-space of the said second part of the receiver above the said dip-funnel, substantially as and for the purpose set forth.

3. In a boiler, the combination, with the steeply-inclined water-tubes, the tube-boxes at each end of the tubes, and the receiver communicating with the said tube-boxes, of an inclined fire-grate consisting of a series of substantially horizontal bars arranged in steps below the lower parts of said tubes, whereby the flames are caused to impinge against said tubes, substantially as set forth.

4. The combination, with a tube-box provided with a circular conical hole, of the circular plate provided with screw *c* and the flanges *a*, the plate *b'*, provided with a circular conical flange fitting between said circular plate and the edge of the hole in the tube-box, and a nut screwed upon the projecting end of screw *c* and bearing against plate *b'*, substantially as and for the purpose set forth.

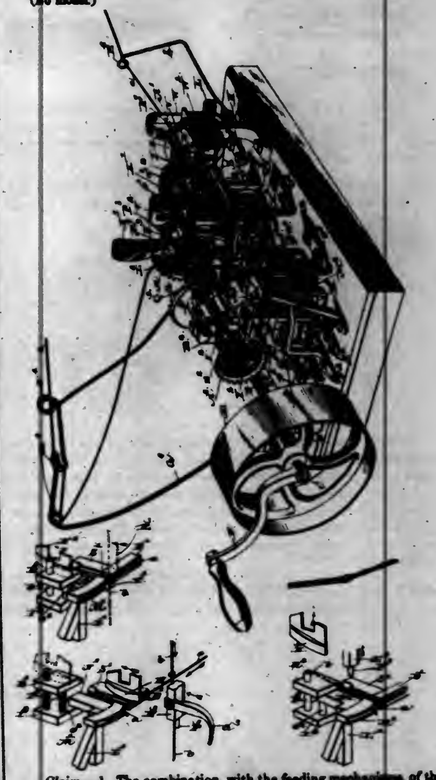


411,192. FIRE-EXTINGUISHING APPARATUS. CHARLES R. HAZEN, New York, N. Y. Filed May 17, 1888. Serial No. 311,189. (No model.)

Claim.—1. The combination of the acid-holder, the expansion-chamber connected therewith by a pipe having a cock *a*, the fluid-tank, a connecting-pipe having a cock *c* between the expansion-chamber and top of the fluid-tank, the plunger or float in the fluid-tank, and the fluid-distributing pipe having a cock D', substantially as set forth.

2. The combination of the acid-holder, the gas-expansion chamber connected therewith by a pipe having a cock *a*, the fluid-tank, a connection having a cock *c'*, leading from the gas-expansion chamber to the top of the fluid-tank, and the fluid-distributing pipe connected at the bottom of the fluid-tank, and having a cock D', substantially as and for the purpose set forth.

411,198. METHOD OF MANUFACTURING BUNDLES OF TOILET-PAPER. OLIVER H. HIGEE, Chicago, Ill., assignor to the Morgan Envelope Company, Springfield, Mass. Filed Jan. 23, 1886. Renewed Aug. 5, 1889. Serial No. 319,790. (No model.)



Claim.—1. The improved method herein described of making bundles of toilet-paper, consisting in winding two independent webs of paper upon each other on a winding-drum with one edge of each convolution overlapping the next preceding one, a line of gum being applied to the inner or overlapping edge of each web, removing the band thus formed from the winding-drum, and cutting it transversely into bundles, substantially as described.

2. The improved method herein described of making bundles of toilet-paper, consisting in winding two independent webs of paper upon each other on a winding-drum with one edge of each convolution overlapping the next preceding one, a line of gum being applied to the inner or overlapping edge of each web, removing the band thus formed from the winding-drum, and cutting it transversely into bundles, substantially as described.

3. The improved method of making bundles of toilet-paper, consisting in winding two independent webs of paper upon each other on a winding-drum with a line of gum between them near their edges, removing the band thus formed from the drum, and cutting it transversely into bundles, substantially as described.

4. The method of making bundles of toilet-paper, consisting in winding two independent webs of paper upon each other on a drum or cylinder and applying a line of gum to the side of each convolution adapted to come nearest the drum, removing the band thus formed, and cutting it transversely into bundles.

411,194. MACHINE FOR MAKING WIRE HINGES. DAN L. HILL, West Swanzey, N. H. Filed Feb. 13, 1889. Serial No. 299,796. (No model.)

Claim.—1. The combination, with the feeding mechanism, of the rigid jaw N', the movable jaw S', the jaws I^1 R^1, arranged at right angles to the jaws N' S', and the finger to move between the jaws N' S', for the purpose set forth, substantially as described.

2. The combination, in a machine for making wire hinges, of the movable arm or wire-guide E^1, having finger F^1, the jaws arranged in the path of the latter and adapted to be clamped together, and the movable clamping-jaws adapted to follow the wire-guide and finger, substantially as described.

3. The combination of the clamping-jaws, the feeder to direct a wire across one end of the same, and the wire feeder or guide arm having a finger adapted to move between the opposing sides of said jaws and thereby bend the wire into U form, substantially as described.

4. The combination of the pair of clamping-jaws, the feeder to direct a wire across one end of the same, the cutter to sever the wire, and the wire feeder or guide arm having a finger adapted to move between the opposing sides of said jaws, for the purpose set forth, substantially as described.

5. The combination of the stationary pair of clamping-jaws, the bending arm or finger to pass between them, and the pair of movable clamping-jaws traveling across the stationary jaws and in rear of the bending arm or finger, substantially as described.

6. The combination of the driving-shaft having the crank, the counter-shaft geared thereto and having the cams, the feed-rollers operated by said counter-shaft, the reciprocating bar D^3, operated by the driving-shaft, the standard pivoted thereto, the clamping-jaws carried thereby, the levers connected to the clamping-jaws and operated by the cams on the counter-shaft, the standard having the rigid jaw, the lever O', having the movable jaw N' and operated by one of the cams on the counter-shaft, the reciprocating oscillating frame operated by the cranked driving-shaft and having the bending arm or finger, the feed-rollers, and the cam to operate the pivoted standard, substantially as described.

7. The combination of the reciprocating standard, the clamping-jaws carried thereby, the levers connected to said jaws to operate the same, and the shaft having the cams operating said levers, substantially as described.

8. The combination, with the reciprocating bar, of the standard pivoted thereon, the movable clamping-jaws carried by said standard and having the right-angled bars, the levers having the slots engaging said bars, and the shaft having the cams operating said levers and the retracting-springs, substantially as described.

9. In a machine for making wire hinges, the combination of the reciprocating bar, the standard pivoted thereon and having the movable clamping-jaws, the cam to move the standard laterally in one direction, the spring to move the standard laterally in the reverse direction, the movable frame having the bending-finger, the levers connected to the clamping-jaws, and devices to operate said levers, substantially as described.

10. The combination of the two pairs of clamping-jaws, one pair being stationary and the other pair relatively movable, the bending-arm to travel between the relatively-stationary jaws, and the levers and cams to close the said pairs of jaws in succession, said cams and levers being adapted to open the jaws simultaneously, substantially as described.

11. The combination of the wire-feeding devices arranged at right angles to each other, with the relatively-stationary pair of clamping-jaws, the movable pair of clamping-jaws adapted to traverse the former, and the bending-arm and operating devices, substantially as described.

12. In a machine for making wire hinges, the combination of the two pairs of clamping-jaws, one pair being relatively stationary and the other pair relatively movable, the bending-arm to travel between the relatively-stationary jaws, and mechanism whereby said jaws shall be closed in succession but opened simultaneously, as set forth.

13. In a machine for making wire hinges, the combination, with the wire-guides B', the clamping-jaws N' S', and finger F^1, of the hook G, which follows in rear of the finger F^1 and engages the next succeeding portion of the wire that is fed forward through the guides B' and partly bends the same, for the purpose set forth.

14. In a machine for making wire hinges, the driving-shaft and counter-shaft geared thereto, in combination with the feed-rollers operated by the counter-shaft, the reciprocating bar D^3, operated by the driving-shaft, the clamping-jaws carried by the bar D^3, said jaws being operated by the counter-shaft, and the reciprocating oscillating frame operated by the driving-shaft and having the bending arm or finger, as set forth.

15. In a machine for making wire hinges, the driving-shaft and the counter-shaft geared thereto, in combination with the reciprocating bar D^3, operated by the driving-shaft, the clamping-jaws carried by the bar D^3 and operated by connections with the counter-shaft, and the reciprocating oscillating frame operated by the driving-shaft and having the bending arm or finger adapted to move between the opposing sides of the said jaws, as set forth.

16. In a machine for making wire hinges, the feed-rollers Y S and the guide B' for one wire *a*, in combination with the feed-rollers K^3 L^3 for the other wire *b*, the moving guide-arm E^1, having a finger adapted to come in contact with the intersecting portions of the wires, and the clamping-jaws, as set forth.

17. In a machine for making wire hinges, the feed-rollers S Y and the guide B' for one wire *a*, in combination with the feed-rollers K^3 L^3 for the other wire *b*, and the moving guide-arm E^1, having a finger adapted to come in contact with the intersecting portions of the wires, and the cutter I', to sever the wire *a* and leave the severed portion in the grasp of the finger and the clamping-jaws, as set forth.

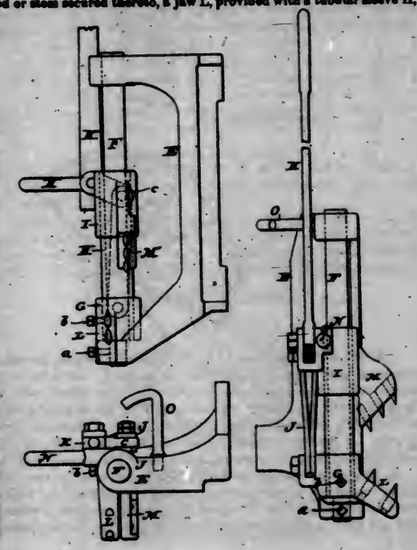
18. In a machine for making wire hinges, the guide B' for one wire *a*, in combination with the feed-rollers K^3 L^3 for the other wire *b*, the moving guide-arm E^1, having a finger adapted to come in contact with the intersecting portions of the wires, the cutter I', to sever the wire *a* and leave the severed portion in contact with the finger, and the jaws S' N', between which the finger passes, the jaw S' being caused to move toward the rigid jaw N' and bend the severed portion of the wire *a* into the form of a staple, as set forth.

19. In a machine for making wire hinges, the guide B' for one wire *a*, in combination with the feed-rollers K^3 L^3 for the other wire *b*, the moving guide-arm E^1, having a finger adapted to come in contact with the intersecting portions of the wires, the cutter G', to sever the wire *a* and leave the severed portion in the grasp of the finger, and the jaws S' N', between which the finger passes, the jaw S' being caused to move toward the rigid jaw N' and bend the severed portion of the wire *a* into the form of a staple, the jaw S' closing against the jaw N' and thereby clinching the severed portion of the wire *a*, as set forth.

20. In a machine for making wire hinges, the moving arm or guide E^1, having the bending-finger, combined with the jaws S' N', between which the arm or guide passes to bend the wire *a*, the jaws I^1 R^1, adapted to move in front of the wire *b* and become engaged therewith and to bend the same, and the cutter carried by the guide-arm to sever the wire *b*, as set forth.

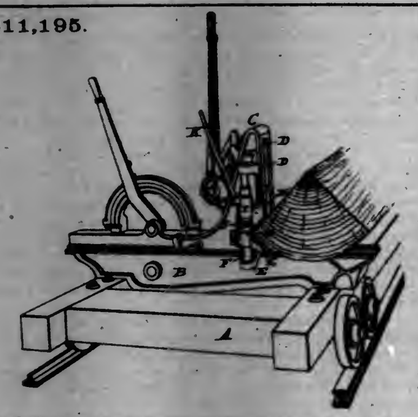
21. In a machine for making wire hinges, the jaws N' S', between which the wire *a* remains clinched, and the jaws I^1 R^1, arranged at right angles to the jaws N' S' and adapted to move rearward under and over the jaws N' S' and serve to bend the severed portion of the wire *b* in the best portion of the wire *a*, thereby linking the said bent wires together, as set forth.

411,195. SAW-MILL DOG. GEORGE M. HUSELBY, Milwaukee, Wis., assignor of one-half to E. P. Allis & Company, of same place. Filed May 16, 1889. Serial No. 311,090. (No model.)



Claim.—1. In combination with a head-block or log-support, a knee, dogs mounted upon the knee and free to slide vertically relatively thereto, and an operating-lever for the dogs adapted to move therewith as the said dogs rise and fall with the timber.

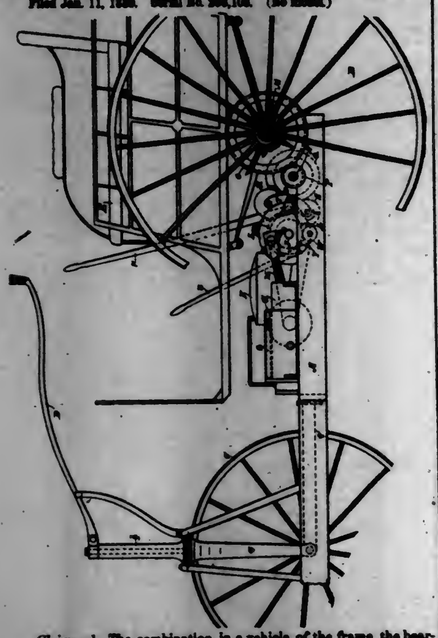
2. In combination with a head-block or log-support, a knee and dogs mounted upon the knee and free to slide vertically and also to swing laterally with reference to their support, and a lever for operating the dogs, the lever and dogs being adapted to be swung out of the way, as shown.



3. In combination with a head-block or log-support, a knee and dogs mounted therein and free to slide vertically relatively thereto, whereby the dogs are permitted to adjust themselves to the lowering of the timber.

4. In combination with a head-block or log-support, a knee, a rod or stem secured thereto, a jaw L, provided with a tubular sleeve H, a jaw M, mounted upon the sleeve, a lever journaled in the jaw L, and a link connecting the lever with the jaw M.

5. In combination with a head-block or log-support, a knee, a rod or stem secured thereto, a jaw L, provided with a tubular sleeve H,



411,195.

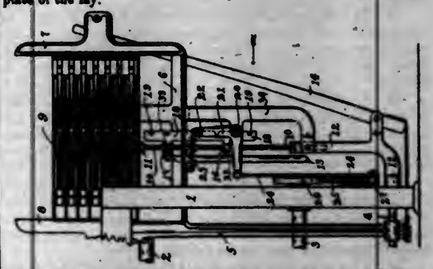
a jaw M, mounted upon the sleeve, a lever journaled in the jaw L, a link connecting the lever with jaw M, and a stem or handle N, secured to jaw L.

6. The combination, with a saw-mill carriage, of a head-block or log-support, a knee mounted on the head-block, jaws or dogs applied to the knee in such manner as to rise and fall together, but capable of independent movement, substantially as described, and a lever connected with the jaws for causing this independent clamping movement.

411,196. VEHICLE. FRANK A. HUNTINGTON, San Francisco, Cal. Filed Jan. 11, 1889. Serial No. 296,103. (No model.)

Claim.—1. The combination, in a vehicle, of the frame, the bearing-wheels upon which it is supported, an engine by which power is transmitted to the engine-shaft, a counter-shaft from which power is transmitted directly through gearing to each of the bearing-wheels independently, said shaft being divided and having a differential driving-gear, and gearing intermediate between the engine-shaft and this shaft, whereby power is transmitted to it, substantially as described.

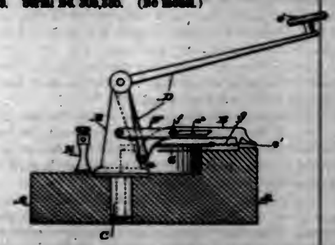
2. The vehicle having the independently-journaled bearing and driving wheels and a steering wheel or wheels, an engine from which power is transmitted to the driving-shaft, and frictional wheels mounted upon said shaft, a divided counter-shaft with gearing, whereby power is transmitted from it to each of the driving-wheels independently, a frictional drum upon said shaft containing a differential gear, in combination with intermediate movable friction-drums, whereby power may be transmitted from the engine-shaft to the counter-shaft, substantially as described.



3. The vehicle mounted upon independent driving and steering wheels, independent gears by which each of the driving-wheels is propelled, a divided counter-shaft having a frictional drum and a differential gear, whereby the wheels may be driven independently at different rates of speed, in combination with an engine, an engine-shaft provided with a corresponding frictional drum, and a movable frame supporting an intermediate friction-drum between the drums upon the counter-shaft and the engine-shaft, and a lever, whereby said intermediate drum may be turned into or out of contact with the others, substantially as described.

4. The main axle having the independently-journaled bearing and driving wheels of the vehicle, a divided counter-shaft with a differential clutch mechanism and frictional drums of different sizes, and an engine and shaft having corresponding frictional drums of different sizes in plane with those upon the counter-shaft, but out of contact therewith, in combination with an intermediate segmental yoke having drums journaled in it corresponding with the different-sized drums upon the engine and counter shaft, a rocker-shaft and arm by which the movable yoke is suspended, and a lever by which said shaft is moved, so as to throw either of the rollers into contact with the corresponding drums upon the engine-shaft and counter-shaft, whereby the change of speed may be effected, substantially as herein described.

5. The vehicle having independently-driven wheels, a counter-shaft and engine-shaft with friction-wheels, and an intermediate movable yoke, with idler-wheel through which power may be transmitted from the engine-shaft drum to the counter-shaft drum, in combination with a supplemental shaft, rocker-arm and drum, and a lever for moving the same, whereby a reversal of the motion of the vehicle may be effected by throwing this supplemental drum into contact with the driving-wheels, substantially as herein described.

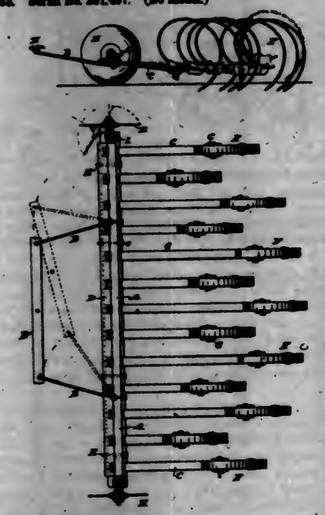


411,197. SHUTTLE-BOX-LOCKING DEVICE FOR LOOMS. GEORGE F. HUYBERS, Worcester, Mass., assignor to the Knowles Loom Works, same place. Filed Apr. 6, 1889. Serial No. 306,204. (No model.)

Brief.—The object of the invention is to prevent the vibration of the shuttle-box caused by the shifting of the boxes, and to correct any error in the alignment of the shuttle-box shelves with the race-plate of the lay.

Claim.—In a loom, the combination, with a tier of shuttle-boxes, a lifter, and guide-rod, of a locking-plate, a locking-arm, an operating-spring and operating-cam, and connections intervening between said cam and locking-arm, substantially as set forth.

411,198. TELEGRAPH-KEY. ALFRED R. JOHNSON, Carson City, Nev., assignor of one-half to Moses H. Cohn, same place. Filed Apr. 3, 1889. Serial No. 306,305. (No model.)



Claim.—1. The combination, with the bed-piece having electric contact-surfaces thereon and representing telegraphic characters, of a key-lever mounted in a rotary standard, and a single contact-finger pivoted to the short arm of the key-lever and adapted to move backward over the contact-surfaces when the key-lever is depressed, said contact-finger having also a vertical movement on an independent axis, substantially as described.

2. In a telegraphic key, the bed-piece having upon it the series of electric contact-surfaces representing telegraphic characters, in combination with the standard mounted on a vertical axis in the bed-piece, the elbow key-lever pivoted on the standard, whereby said lever may be moved in vertical and horizontal planes, and the contact-finger pivoted to the key-lever, so that it may be turned to and passed in electrical contact over any of the electric surfaces, substantially as described.

3. In a telegraphic key, the bed-piece having upon it the series of electric contact-surfaces representing telegraphic characters, in combination with the vertically and horizontally swinging key-lever, the contact-finger pivoted to said key-lever and adapted to be turned to and passed in electrical contact over any of the electric surfaces, said finger having a lug on its side, and the pivoted arm F, having a stud *f*, engaging the lug of the finger, for holding said finger out of contact with the electric surfaces on its return movement, substantially as described.

4. An automatic telegraph-key consisting of the bed-piece having the electric contact-surfaces representing telegraphic characters, the sleeve mounted on the bed-piece, the rotary standard carried by the sleeve, the elbow key-lever pivoted to the standard, the contact-finger pivoted to the key-lever and operating over and in contact with the electric surfaces in one direction, the pivoted arm F, having stud *f*, the lug on the contact-finger, for holding said finger out of contact in the other direction, and an electric circuit, including the contact surfaces and finger, all arranged and adapted to operate substantially as described.

411,199. HARROW. CHARLES LE DOW, Albany, N. Y. Filed July 30, 1888. Serial No. 281,497. (No model.)

Claim.—1. The combination of the flat-faced cross-bar and the flat drag-bar having a hook at its front end which engages with a straight edge of the cross-bar and forms a hinge-connection with the cross-bar.

2. An angle-iron cross-bar having slots *c'*, in combination with the drag-bars passing through said slots, and teeth on the drag-bars.

3. An angle-iron cross-bar having slots *c'* in its front and rear faces, in combination with drag-bars passing through the slots in the rear face and hinged in the slots in the front face.

4. An angle-iron cross-bar having slots *c'* in its rear side or face, in combination with drag-bars passing through said slots and hinged to the front side of the cross-bar.

5. The combination of the drag-bars and the cross-bar having rectangular slots, in which the hooked ends of the drag-bars engage.

6. The combination of the hooked drag-bars, the cross-bar having slots in which the hooked drag-bars engage, and a locking-plate common to all the drag-bars for securing them in place.

7. The combination of the slotted cross-bar, a drag-bar whose hooked end engages in said slot, and a locking-plate having tongues *d' d'*, as described, for holding the hooked end of the drag-bar in place.

8. The combination of the slotted cross-bar, the hooked drag-bars, the locking-plate, and adjustable securing devices for holding the locking-plates.

9. A cross-bar having a side or face *a*, to which the drag-bars are hinged, and a draft-connection in rear of the hinges and applied to the cross-bar below the plane of the face *a*, for the purpose set forth.

10. The combination of the cross-bar, the drag-bars flexibly connected or hinged thereto at their inner ends, the teeth on the outer ends of the drag-bars, and flexible draft devices located in substantially the same horizontal plane as the cross-bar.

11. The combination of the cross-bar, the drag-bars hinged thereto, the teeth on the outer ends of the drag-bars, the swiveled draft-rods of the cross-bar, and a cross-rod B'.

12. The combination, with the cross-bar, of the narrow plate-metal low wheels, supporting the cross-bar at each end close to the ground and adapted to permit rubbish to pass backward, and the drag-bars connected with the cross-bar, as set forth.

13. The combination, with the drag-bar and tooth, of a holder or casting which clamps the drag-bar by its outer side edges and also carries the tooth.

14. The combination, with the drag-bar and tooth, of an interposed tooth holder or casting which clamps both the drag-bar and tooth by their outer side edges.

15. The combination, with the drag-bar and tooth, of the clamping device or tooth-holder made in sections and clamped upon the tooth and bar by a bolt located between the tooth and bar.

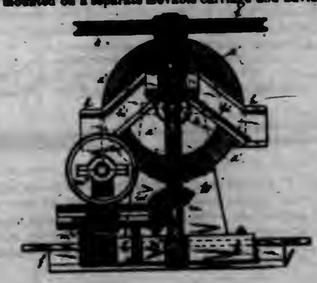
16. The drag-bar having a hooked rear end, in combination with the sectional tooth-holder having sockets for embracing the end of the bar, and clamping devices to clamp the holder to the edges of the bar.

17. The combination of the drag-bar, a sectional tooth-holder having a seat or socket for the outer end of the drag-bar, and a separate curved socket for the curved spring-tooth, and adjustable clamping devices for securing the drag-bar and the tooth in their sockets between the sections of the holder.

18. The combination, with the cross-bar, of wheels at each end of the cross-bar having horizontal axles pivoted directly upon the cross-bar and projecting therefrom and capable of vibrating horizontally upon their pivots, for the purpose set forth.

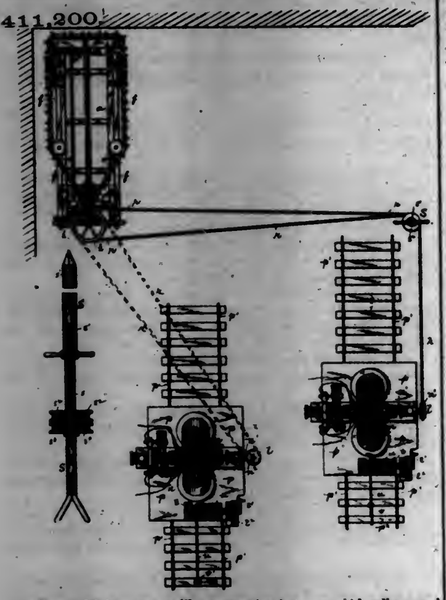
19. The combination, with the cross-bar, of the wheels at each end of the cross-bar, their horizontally vibrating or swinging axles mounted on the cross-bar, and stops for limiting the vibration of the wheels.

20. The combination, with the axle, of a removable hub carrying the wheel and having flange *k*, and collars *k' k²*, between which the wheel is removably clamped.



21. The combination of the hub having the shoulder *k* and lugs *k²*, of the opposing collars *k' k²*, between which the wheel is clamped, one of said collars having interior notches, through which said lugs pass, and oppositely-inclined segmental surfaces upon which said lugs travel to clamp the hub, collars, and wheel together.

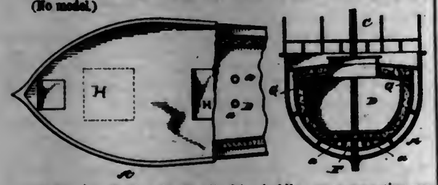
22. The cross-bar having slots *c'*, through which the vibratory drag-bars pass, said slots being provided with side wearing-plates *l*.



23. The combination of the slotted cross-bar and long and short drag-bars passing through said slots, the slots for the shorter bars being on a lower level than those for the others, for the purpose set forth.

411,200. MINING-MACHINE AND APPARATUS FOR OPERATING THE SAME. FRANCIS H. LOUDEN, Columbus, Ohio. Filed Sept. 19, 1883. Serial No. 305,816. (No model.)

Claim.—1. The combination, with the mining-machine having a vertical shaft at the rear end thereof, carrying a pulley thereon, and connections from said shaft to the operative parts of the machine, of a motor mounted on a separate movable carriage and having thereon



411,200.

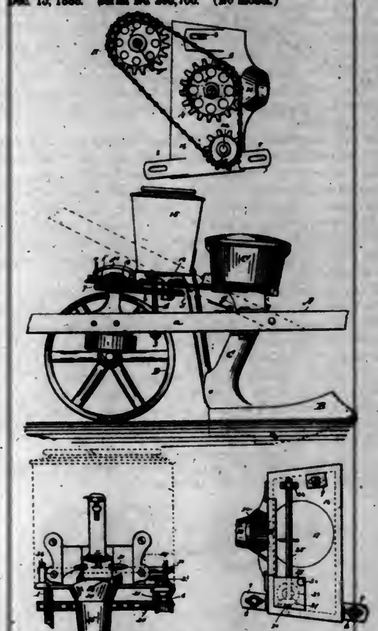
a pulley, a driving-rope or like connection between said pulleys, and a drum or other suitable mechanism for adjusting and holding the motor in proper position for driving the mining-machine, substantially as and for the purposes set forth.

2. The combination of a mining-machine, a motor mounted upon a separate movable carriage, a driving-rope or like power connection between the motor and the mining-machine, and a drum on the motor-carriage carrying a rope to be secured to a stationary object for adjusting and holding the carriage in proper position for driving the mining-machine, substantially as and for the purposes set forth.

411,201. ICE TRANSPORTATION AND STORAGE VESSEL. RICHARD RICE, Washington, D. C. Filed Dec. 4, 1888. Serial No. 292,615. (No model.)

Claim.—1. The herein-described ice holding or transporting vessel, the main hold of which is provided with walls having non-conducting packing and a water-space beneath said hold or chamber, and drain-pipes leading from the main hold to near the bottom of the water-space, substantially as described.

2. The herein-described ice holding and transporting vessel, the main hold of which is provided with walls having a filling-space between them for the reception of non-conducting packing, the outer wall being imperforate and the inner wall of the filling-space for the sides of the vessel being provided at the top with removable strips extending the entire length of said inner wall, and rigid securing devices for said strips, substantially as described.



411,202. SCREW. GEORGE P. ROSS, Fenton, Mich. Filed May 31, 1883. Renewed July 22, 1889. Serial No. 318,195. (No model.)

Claim.—1. A screw headed and pointed screw having its threaded part flat on two opposite sides, while the body of the screw is circular in cross-section and vertically straight in the spaces between the threads on the other two sides of the screw, substantially as set forth.

2. A screw headed and pointed screw having its threaded part flat on two opposite sides, while the body of the screw is circular in cross-section, substantially as set forth.

411,203. PLANTER. LEVI SCOFIELD, Grand Haven, Mich. Filed Dec. 15, 1888. Serial No. 293,709. (No model.)

Claim.—1. In a planter such as described, wherein the seeding mechanism is operated from a pulley or wheel on a driving-shaft, and in combination with said shaft and a disk or plate secured thereto, two wheels loosely mounted on the shaft and connected the one to the seed and the other to the fertilizer mechanism, and an adjustable locking-pin co-operating with said wheels and disk to lock one or both wheels to the disk, substantially as set forth.

2. In a planter such as described, and in combination with the seed-feeding devices, a fertilizer attachment, and a driving-shaft common to both of said devices, independent driving-wheels loosely supported upon said shaft, a disk or arm secured to said shaft, and a pawl pivoted to one of said members and provided with an adjustable pin for co-operating with notches or perforations in said driving-wheels to connect one or both with the driving-shaft, as and for the purpose set forth.

3. In a planter such as described, the combination of the seeding mechanism and fertilizer attachment mounted upon the frame, a driving-shaft provided with a plate having a hub thereon, a loose sprocket-wheel interposed between said plate and the bearing for the shaft, a second sprocket-wheel taking its bearing on the hub of the plate and held in position by a cap, and a locking-pin adapted to lock said sprocket-wheels to the plate, substantially as described.

4. In a planter such as described, and in combination with the sprocket-wheels for actuating the seeding and fertilizer mechanism through independent sprocket chains or belts and the disk or arm attached to the driving-shaft, an arm carrying a locking-pin pivotally supported at one side of its longitudinal center, substantially as and for the purpose set forth.

5. In a planter such as described, the combination of the frame and the driving-shaft supported in bearings thereon and provided with a sprocket-wheel, a fertilizer attachment adjustably attached to the frame, so as to be movable toward and from the driving-shaft, and provided with an actuating sprocket-wheel connected to the first-named sprocket-wheel by a chain, substantially as set forth.

6. In a planter such as described, the combination, with the driving-shaft and sprocket-wheel, of the fertilizer attachment adjustably secured to the frame, so as to be movable toward and from the driving-shaft, and provided with two sprocket-wheels, the one for actuating the feeding mechanism and the other the stirrer, and a chain engaging all of the sprocket-wheels, substantially as and for the purpose set forth.

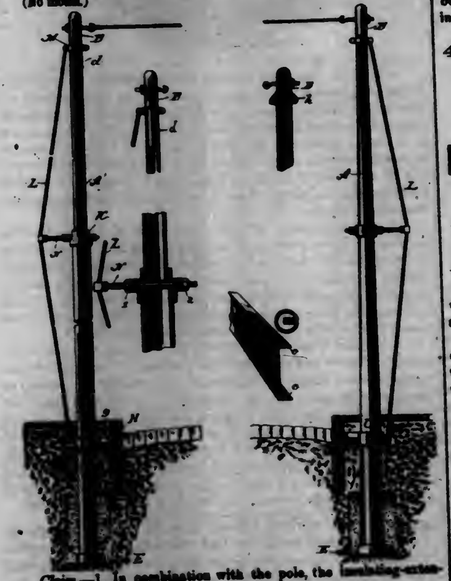
7. In a planter such as described, and in combination with the runner and the fertilizer attachment adjustably secured to the frame and provided with a spout, the conduit pivotally attached to the heel of the runner, substantially as described.

8. In a planter such as described, and in combination with the frame and the adjustable fertilizer attachment mounted thereon and provided with a tapered spout, the conduit fitting over said spout and pivotally secured at or near its lower end to the runner, substantially as described.

9. In a planter such as described, and in combination with the frame, a fertilizer attachment provided with a bottom plate having an elongated opening for the passage of a fastening-bolt within the hopper, and a covering-plate for said slot, substantially as described.

10. In a fertilizer attachment for planters such as described, the combination of the hopper and the bottom plate, the stirrer mounted upon said plate and driven by gearing within the hopper, and the casing inclosing said gearing, substantially as and for the purpose set forth.

11. In a fertilizer attachment such as described, and in combination with the bottom plate and the stirrer working within the hopper, the gearing for operating said stirrer, and the detachable casing secured to the bottom plate and co-operating with the wall of the hopper to inclose the gearing, as set forth.



12. In a fertilizer attachment, the combination of the plate provided with a bearing for the feed-plate and for the stirrer, a detachable casing inclosing the driving-gear and forming a bearing for the stirrer, substantially as described.

13. In a fertilizer attachment, the combination of the bottom plate of the hopper provided with bearings for the feed-plate and stirrer-actuating devices, the sprocket-wheels detachably secured to the feed-plate and stirrer-actuating devices and driven by a single sprocket-chain passing around and engaging the sprocket-wheels on the driving-shaft, the feed-plate, and the actuating-shaft of the stirrer, substantially as described.

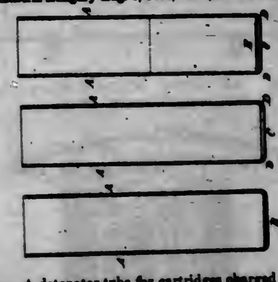
14. In a fertilizer attachment, and in combination with the bottom plate of the hopper, feeding devices, and the stirrer, with gearing for actuating the latter, a casing secured to the bottom plate and inclosing the gearing, said bottom plate being perforated beneath the casing, substantially as and for the purpose set forth.

15. In a fertilizer attachment, and in combination with the hopper, the stirrer-shaft, and the stud or shaft projected through the bottom plate and provided with a bevel-gear, the bevel-gear applied to the end of the stirrer-shaft, and the adjustable plate or abutment interposed between the end of the stirrer-shaft and the wall of the hopper, substantially as described.

411,204. POLE FOR SUPPORTING ELECTRIC CONDUCTORS. SIDNEY H. SHORT, Columbus, Ohio. Filed Nov. 6, 1888. Serial No. 290,118. (No model.)

Claim.—1. In combination with the pole, the insulating-extension and bracket, substantially as described.

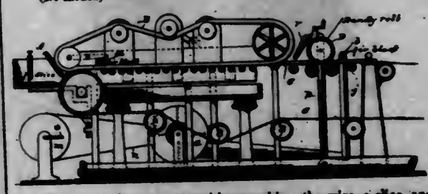
2. The sleeve G, fixed to the pole and having a foot arranged to bear against the curb-stone, substantially as described.



3. In combination with a metallic pole, a collar secured to the upper end, and a sleeve at its lower end, with a truss-rod L between the two, and an adjustable straining-post for the truss-rod between it and the pole, substantially as described.

4. In combination with a metallic pole made in two parts and connected by a coupling, a collar secured at the upper end thereof, and a sleeve at its lower end, a truss-rod L between the two, and an adjustable straining post or strut supported in the coupling between the two parts of the post and in connection with the rod L, substantially as described.

411,205. PROCESS OF TREATING MOLTEN METAL WITH NATURAL GAS. FRANK L. SLOCUM and HORACE W. LASH, Pittsburg, Pa., assignors to Thomas J. McTighe, New York, N. Y., and said Frank L. Slocum, trustees. Filed Mar. 15, 1889. Serial No. 303,227. (No model.)



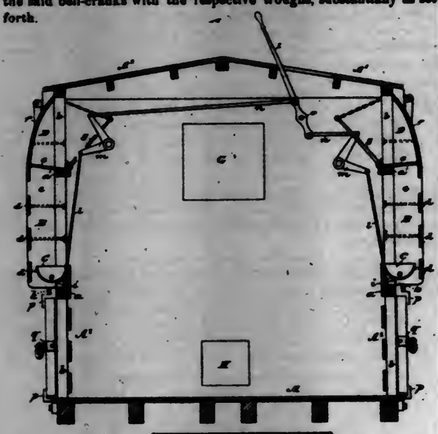
Claim.—The herein-described improvement in the art of treating metals, consisting in heating natural gas or methane to a point below the temperature at which it decomposes, and then passing it through the metals when in a molten condition, substantially as and for the purpose set forth.

411,206. PRIMER-TUBE FOR DYNAMITE CARTRIDGES. GEORGE SMITH, Glasgow, County of Lanark, Scotland. Filed June 26, 1886. Serial No. 278,281. (No model.) Patented in England June 26, 1886, No. 8,909; in France Dec. 9, 1886, No. 180,179; in Belgium Dec. 10, 1886, No. 75,503; in Germany Dec. 11, 1886, No. 41,323; in Canada Jan. 19, 1887, No. 26,813, and in Austria-Hungary Aug. 9, 1887, No. 1,073 and No. 34,645.

Claim.—A detonator-tube for cartridges charged with dynamite or similar explosive, and consisting of a tube of thin steel having an open but contracted inner end, a plating of thin copper upon this tube, and a disk of this material closing the inner end, the said disk being inserted at the outer end and retained by the contraction at the inner end, substantially as and for the purposes herein set forth.

411,207. PAPER-MAKING MACHINE. CHARLES STRESS and FREDERICK STRESS, Lafayette, Pa. Filed July 27, 1888. Serial No. 281,186. (No model.)

Claim.—1. In a paper-making machine, the wire, a slice, and a wind chest or pipe arranged next the slice and opening toward the slice, combined with a suitable blower, substantially as described.



2. In a paper-making machine, a wire, a dandy-roll, and a wind chest or pipe arranged in the rear of the dandy-roll and opening toward such dandy-roll, combined with a suitable blower, substantially as described.

411,208. STOCK-CAR. STEPHEN P. TALLMAN, Dunellen, N. J. Filed Dec. 22, 1888. Serial No. 294,402. (No model.)

Claim.—1. A stock-car provided with projecting housings B B at its opposite sides, with tilting troughs C C, mounted on the outer sides of the car within said housings, and a lever-shift for simultaneously dumping said troughs outward, said lever-shift consisting of the cranks *k k* on the troughs, the bell-cranks *m m*, the operating-lever I, and the connecting-rods *l l n n*, all arranged to operate substantially as set forth.

2. A stock-car provided with outwardly-tilting troughs mounted

on the opposite sides of the car, and with a lever-shift mounted on the inner face of the end of the car for shifting said troughs simultaneously, said lever-shift consisting of two bell-cranks *m m*, an operating-lever l, fulcrumed on the end of the car and projecting through the roof thereof, rods *n n*, coupling said lever on opposite sides of its fulcrum with the respective bell-cranks, and the rods *l l*, connecting the said bell-cranks with the respective troughs, substantially as set forth.

411,209. LAMP-STOVE. WILLIAM H. WILDER, Gardner, Mass. Filed Nov. 16, 1888. Serial No. 291,012. (No model.)

Claim.—1. In a lamp-stove, the tank, the top grate, the chimney formed of sheet metal bent into elongated form and having the lighting-opening extending approximately all the way across the front or from end to end of the wick, said chimney being united at the center of the front, forming a seam intermediate of the lighting-openings, which serve to support the top grate, substantially as described.

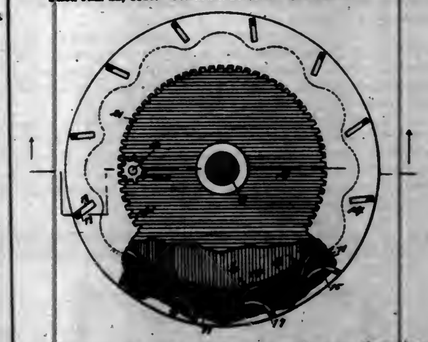
2. In combination, the horizontal cone-plate having the cone projecting upward therefrom, the chimney having its lower edge resting upon the cone-plate, the said cone being formed with slots in its upwardly-extending wall above the surface of the cone-plate and the said chimney having a portion of its edge bent therein, substantially as described.

3. In combination, the chimney and the grate, said grate resting upon a portion of the upper edge of the chimney, whereby the said grate is supported by the metal on edge, said grate having projecting ends 13^a bent downwardly, and the said supporting-chimney having portions of its upper edge bent over the said downwardly-bent ends 13^a to connect the parts, substantially as described.

4. In combination, in a lamp-stove, the tank and the leg, said leg being formed to lie along the side of the tank and to engage with its top, and means for holding the leg at the bottom of the tank, substantially as described.

5. In combination, in a lamp-stove, the tank and the leg, said leg having a hooked upper end to engage with the tank-top, and the screw passing through the leg and engaging with the tank, substantially as described.

6. In combination, in a lamp-stove having the notched projections, the tank, the leg having its end engaging with the tank-top, the screw passing through the leg, and the notch in the projection on the tank and the nut on the inner end of the screw, substantially as described.



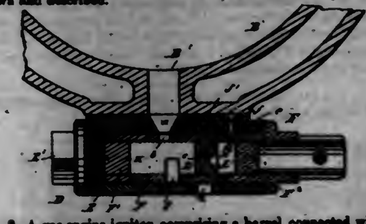
7. In combination, in a lamp-stove, the tank, the leg extending along the side of said tank and having its end engaging with the top thereof, the two projections on the leg to bear upon the corner of the tank, and the screw for drawing the leg into proper position.

8. In combination, a lamp-stove, the tank made of two parts—namely, the cover and the body portion—and a supporting-leg held to the tank and having a hooked end engaging with the cover, substantially as described.

9. In combination, in a lamp-stove, the tank provided with a rib, and a supporting-leg held to the tank and having an upward extension with a hooked end engaging with the rib, substantially as described.

10. In a lamp-stove, and in combination, the tank and the removable legs therefor, and means for removably securing the legs to the tank at or near the lower portion thereof, each of said legs having a portion extending upwardly in front of the tank-side, the upper end of which is connected to the tank, substantially as described

411,210. WATER-WHEEL. HENRY J. ADAMS, North Jay, Me. Filed Jan. 22, 1889. Serial No. 297,176. (No model.)



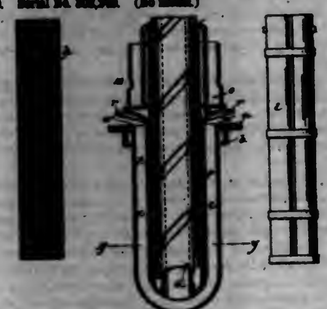
Claim.—1. The water-wheel 1, of even diameter throughout its length and provided with buckets 5, each having a downwardly and backwardly trending curved upper portion 22 and a lower portion 23, ending in a vertical line at the bottom extending from the portion 22 in a reverse spiral line, the portion 22 having a concave face 24, gradually widening at the edge or lip 25^a as it continues into the portion 23, as shown at 24^a, all of said buckets being convex on their back and concave on their face throughout their entire lengths, substantially as set forth.

2. The combination, with the water-wheel, of the casing having a cylindrical lower section and an upper section 13, having a sinuous or corrugated peripheral wall 8^a, provided with openings 10 in its concavities, the concavities and convexities of said wall being rounded or curved, the gates 15, hinged at the forward edges of said openings and shaped to fit into the said concavities over the openings 10, and means for operating said gates, substantially as set forth.

3. A water-wheel casing formed with a sinuous periphery and a cylindrical lower section, water-inlet openings in the upper sinuous section, vertical hinged curved gates for said openings, having lugs on the upper edge and a flat ring mounted to revolve on the top of the casing, having inclined slots engaging the lugs on the gates and provided with gear-teeth, and a shaft carrying a pinion engaging the gear on the ring, in combination with a water-wheel consisting of a drum-like body having a flanged top and buckets extending downward in a reverse spiral having a concave face, a convex back, and widened at the lip toward the bottom, substantially as shown and described.

411,211. IGNITOR FOR GAS-ENGINES. ISAAC F. ALLMAN, Jersey City, N. J. Filed May 28, 1889. Serial No. 311,993. (No model.)

Claim.—1. A gas-engine igniter comprising a plunger provided with two compartments, of which one is connected at all times with the engine-cylinder and the other alternately connects with the engine-cylinder and the igniting-flame, and a plug forming the partition between the said two compartments and provided with a small aperture connecting the two compartments with each other, substantially as shown and described.



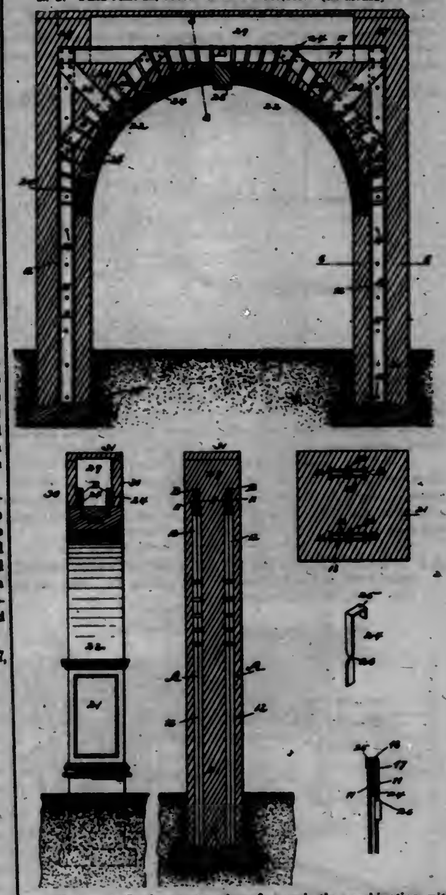
2. A gas-engine igniter comprising a barrel connected with the engine-cylinder, a plunger held to slide in the said barrel and provided with two compartments, of which one is connected at all times with the engine-cylinder and the other alternately connects with the engine-cylinder and the igniting-flame, and a plug forming the partition between the said two compartments and provided with a small central aperture connecting the two compartments with each other, substantially as shown and described.

3. A gas-engine igniter comprising a barrel connected with the engine-cylinder, a plunger held to slide in the said barrel and provided with two compartments, of which one is connected at all times with the engine-cylinder and the other alternately connects with the engine-cylinder and the igniting-flame, a plug forming the partition between the said two compartments and provided with a small central aperture connecting the two compartments with each other, and means, substantially as described, for moving the said plunger slowly outward and rapidly inward, as set forth.

4. The combination, with the gas-engine cylinder, of a barrel secured on the said cylinder and having a port opening into a passage leading to the interior of the cylinder, and a plunger held to slide in the said barrel and provided with an apertured plug dividing the said plunger into two compartments, of which one is at all times connected with the said cylinder-passage and the other alternately connects with the said barrel-port and with the igniting-flame, substantially as shown and described.

5. The combination, with the gas-engine cylinder, of a barrel secured on the said cylinder and having a port opening into a passage leading to the interior of the cylinder, a plunger held to slide in the said barrel and provided with an apertured plug dividing the said plunger into two compartments, of which one is at all times connected with the said cylinder-passage and the other alternately connects with the said barrel-port and with the igniting-flame, and means, substantially as described, for moving the said plunger in the said fixed barrel, as set forth.

411,212. LAMP. JOSEPH H. BASSELL, Bartold, Mo. Filed Mar. 7, 1889. Serial No. 302,249. (No model.)



Claim.—1. The combination, with an Argand burner, of the U-shaped tube embracing the lower portion of the burner, communicating at the upper side of its bend with the lower end of the central air-tube thereof and opening at its upper ends through the cap-plate of the burner, the lower end of the outer burner-tube being open for the entrance of oil, as at *p' p'*, as set forth.

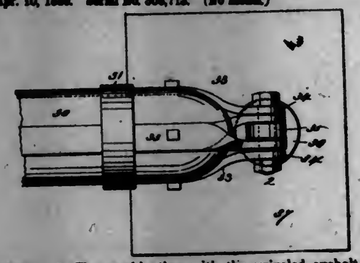
2. The combination, with the burner having the cap-plate, central air-tube *d*, and the outer tube *p*, of the U-shaped tube *c*, communicating at the upper side of its bend with the lower end of the tube *d*, and opening at its upper ends through the cap-plate, the lower end of the tube *p* being open, the ring *q* on the tube *p* above said cap-plate, and the caps projecting therefrom over the ends of tube *c*, substantially as set forth.

3. In a lamp-burner, the combination, with a tube *d*, of a U-shaped tube *c* and caps arranged in connection with each tube, substantially as described.

4. The combination, with the outer burner-tube *p*, the air-tube *d*, and the cap-plate, of a separate and independent tube of less diameter than said tubes and leading from the lower end of the tube *d* under the tube *p* and upward along the outer side thereof and opening through the cap-plate, the lower end of tube *p* being open for the entrance of oil, substantially as set forth.

411,213. CONSTRUCTION OF ARCHES. JAMES BOGERT, Yonkers, N. Y. Filed June 22, 1889. Serial No. 315,185. (No model.)

Claim.—1. In the construction of an arch, the combination, with uprights and girders uniting the uprights, of diagonal brace-plates secured to the uprights and girders, and anchors secured to the brace-plates, girders, and uprights, substantially as shown and described.

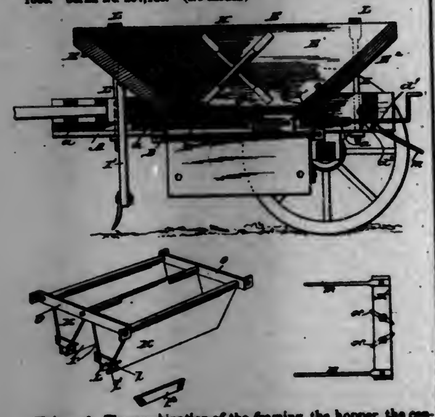


2. In the construction of an arch, the combination, with uprights and girders uniting the uprights, of diagonal brace-plates secured to the uprights and girders, and anchors carried by the brace-plates, the uprights, and girders consisting of a metal bar bent upon itself to form a hook at the upper end and twisted near the lower end, substantially as shown and described.

3. In the construction of arches, the combination, with uprights consisting of two longitudinally-flanged metal beams secured face to face, of girders uniting the uprights, comprising two L-shaped beams face to face passed between the members of the uprights and supported thereby, and anchors attached to the standards, and girders extending inward therefrom and adapted to tie the spring of the arch, substantially as shown and described.

4. In the construction of arches, the combination, with uprights consisting of two united beams having longitudinal flanges upon both faces, and girders uniting the uprights and supported thereby comprising two united beams, each having one longitudinal flange upon its outer face, of brace or tie plates secured to the uprights and girders, and anchors secured to the uprights, the girders and brace-plates projecting inward therefrom, substantially as shown and described.

5. In the construction of arches, the combination, with uprights consisting of two united beams having longitudinal flanges upon both faces, and girders uniting and supported by said uprights, comprising two L-shaped beams introduced between the members of the uprights, of diagonal brace or tie plates secured to the uprights and girders, a solid casing surrounding the uprights and girders, having an arch sprung beneath the girders and between the uprights and provided with an upper compartment, and anchors secured to the uprights, the brace-plates, and girders, and to the members comprising the said arch, substantially as shown and described.

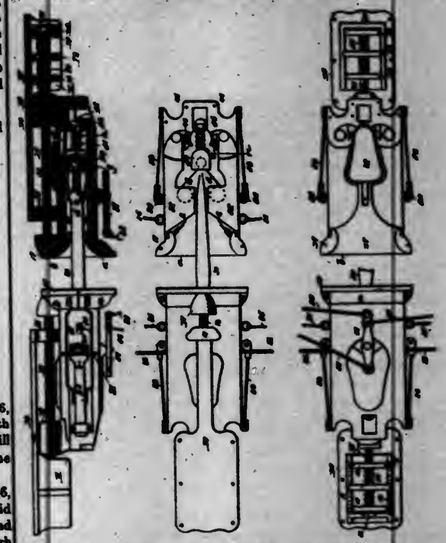


411,214. DERRICK. WILLIAM R. CHAPMAN, Brooklyn, N. Y. Filed Apr. 10, 1888. Serial No. 269,712. (No model.)

Claim.—1. The combination, with the swiveled eyebolt 35 36, of the boom 30, the straps 33, secured to the boom and provided with eyes 34 in their ends, the said ends being bent so that the eyes will register with each other and with the eye of the swivel-bolt, and the bolt 2, passed through the said eyes, substantially as described.

2. The combination, with an A-frame 100 and the swivel-bolt 36, having an eye 35 and arranged between the masts 11 11 of the said frame, of the boom 30, the straps 33, having eyes 34 in their ends and secured to the boom by bands 31, and the bolt 2, passing through said eyes, substantially as herein shown and described.

411,215. SEED-PLANTER AND FERTILIZER-DISTRIBUTER. JAMES A. CHILES and WILLIAM B. MOSS, Comanche, Ia. Filed Jan. 22, 1889. Serial No. 297,169. (No model.)



Claim.—1. The combination of the framing, the hopper, the central drill-boards, the side drill-boards, the bolts for holding the central drill-boards together, and the connecting bar or bars, all substantially as set forth.

2. The combination of the framing, the hopper, the drill-boards adjustable, whereby to drill one or two rows, and the coverer running in rear of the drill-boards and having its teeth or blades adjustable, whereby to cover one or two rows, substantially as set forth.

3. In a machine substantially as described, the combination of the drill-boards hinged at their upper edges and provided near their lower movable edges with pins or projections, and connecting-bars extended between said drill-boards and having openings to receive the pins or projections on the drill-boards, substantially as and for the purposes set forth.

4. In a machine substantially as described, the combination, with the main frame having grooves *c* and stops *c'* and provided with a discharge-opening, of the regulating-doors sliding in said grooves and having shoulders *d*, arranged to abut said stops, the hopper, and the agitator-shaft, substantially as set forth.

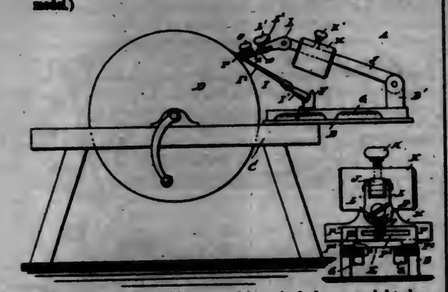
411,216. CAR-COUPLING. JOHN A. DEAN, North Ogden, Utah. Filed Feb. 9, 1888. Serial No. 263,502. (No model.)

Claim.—1. The combination, with a separate and independent link formed with a continuous bore, of a coupler arranged to engage said link, and sockets adapted to receive the link ends, substantially as described.

2. The combination, with a link formed with a continuous bore and with recessed headed ends, of couplers adapted to receive said link, sockets adapted to receive the link ends or heads, and jaws carried by the sockets, said jaws being arranged to enter the link-head recesses, substantially as described.

3. In a car-coupler, a coupling-link 30, formed with headed ends A A, and laterally-projecting knobbed wings *d* between said heads, the link having a longitudinal bore from end to end, substantially as set forth.

4. In a coupler, the combination, with a draw-head, of jaws pivotally mounted therein, springs arranged in connection with the jaws, means for drawing out the jaws, tongues carried by the jaws, and a socket adapted to receive the headed end of a coupling-link and provided with jaws arranged to engage said head, substantially as described.



5. In a coupler, the combination, with a plate arranged for connection with the car-body and formed with a downwardly-extending apertured lug or projection 15, of a draw-bar which passes through the aperture of said lug or projection, a draw-head rigidly connected to the forward end of the draw-bar and formed with an apertured lug through which the draw-bar passes, and springs and follower-plates arranged in connection with the draw-bar, substantially as described.

6. In a car-coupler, a draw-head 17, having opposite longitudinal slots in rear of its outer end or mouth, outward-swinging hooked jaws 22, pivoted at their rear ends in the inner ends of said slots, and springs 23, pressing said jaws inwardly, substantially as set forth.

7. The combination, with a draw-head having opposite inner and outer jaws, of a link having headed ends to engage the inner jaws, and laterally-extending wings between said heads to engage the outer jaws, substantially as set forth.

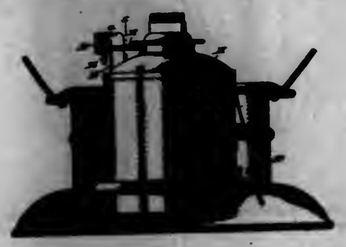
8. The combination, with the draw-head having coupling-jaws, and a longitudinally-yielding socket in rear of said jaws and a tube or pipe connected therewith, of a longitudinally-bored coupling-link having its ends constructed to engage said socket and provided with wings to engage said jaws, substantially as set forth.

411,217. GRINDSTONE TOOL-HOLDER. ALEXANDER E. DEAN, Cramer's Hill, N. J. Filed Mar. 19, 1888. Serial No. 268,000. (No model.)

Claim.—1. A tool-holder comprising a bed-plate, a weighted arm pivoted on the said bed-plate and carrying a clamp for clamping the tool-blade, and a support held adjustably on the said bed-plate and adapted to receive the handle end of the tool, substantially as shown and described.

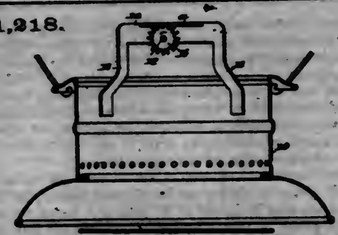
2. A tool-holder comprising a longitudinally-adjustable support adapted to receive the handle end of the tool, a pivoted arm carrying an adjustable weight, and a clamp pivoted on the said arm and adapted to clamp the tool-blade, substantially as shown and described.

3. In a tool-holder, the combination, with a bed-plate, of a support held longitudinally adjustable on the said bed-plate and adapted to support the handle end of the tool, an arm pivoted on the said bed-plate, an adjustable clamp pivoted on the said arm, and a weight held adjustably on the said pivoted arm, substantially as shown and described.



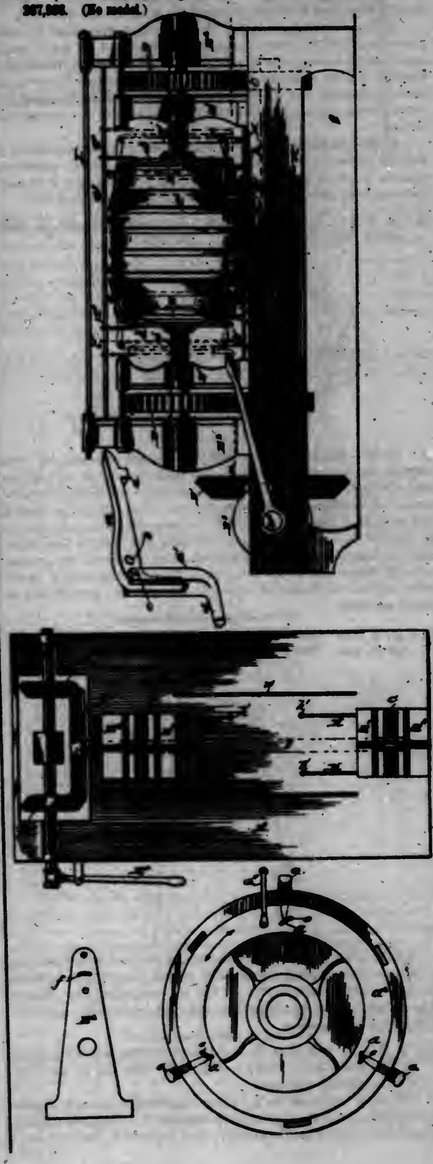
4. In a tool-holder, the combination, with a pivoted arm, a weight held adjustably on the said arm, a plate pivoted on the free end of the said pivoted arm, a second arm pivoted on the plate and adapted to be locked in place on the same, a clamp held on the second pivoted arm and adapted to receive the tool-blade, and a longitudinally-adjustable support adapted to receive the handle end of the tool, substantially as shown and described.

5. In a tool-holder, the combination, with a bed-plate having a longitudinal slot and provided with teeth on its under side, of a tool-handle support comprising a recessed body, a shank held on the said body and projecting through the said longitudinal slot, lugs held on the said shank and adapted to engage the said teeth on the bed-plate, and a button having a transverse slot and adapted to rest in the said recessed body, substantially as shown and described.



6. In a tool-holder, the combination, with a pivoted arm, of a weight held to slide thereon, a set-screw for fastening the said weight in place on the said arm, a plate hinged on the said arm and provided with notches, a second arm pivoted on the said plate and provided with teeth adapted to mesh into the said notches, and an adjustable clamp held on the said second arm and adapted to clamp the tool-blade, substantially as shown and described.

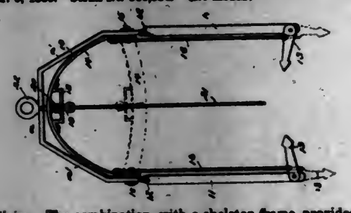
411,218. LANTERN ATTACHMENT. JOHN W. FINNEY, Hamburg, assignor of one-half to John B. Marston, Buffalo, N. Y. Filed Jan. 5, 1889. Serial No. 295,726. (No model.)



Claim.—The combination, with the base of a lantern, of the supporting-arms 15, attached to the interior of the base and projecting above the same, the segmental bar 14, attached to the upper ends of the arms 15, and provided on its inner face with the inwardly-projecting teeth *a*, separated by slots open at their inner ends, and a wick-raising spindle carrying a toothed disk or pinion 16 on its outer end adapted to engage the teeth formed upon the segmental bar, substantially as and for the purpose set forth.

411,218.

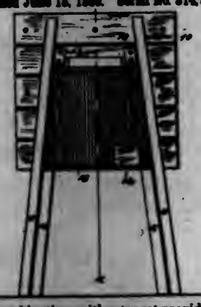
411,219. BARREL-HOOPING MACHINE. FRANK SLAMMONS and WILLIAM W. SIMMONS, Memphis, Tenn. Filed Oct. 12, 1888. Serial No. 287,893. (No model.)



Claim.—1. The combination of the two forcing-heads E E, adapted to bear against the end hoops, and the right-and-left screw-shafts for advancing these heads upon the barrel, the base-frame A, having longitudinal guideways *w* in the same, brackets F, sliding in said guides and carrying catch-hoop F, for contracting the ends of the barrel, the arms G, for forcing the catch-hoops to place, and tripping devices, substantially as described, for throwing the arms over the catch-hoops and allowing the heads to continue to advance and to strike and force on the end hoops, as described.

2. The combination of main frame A with guide-grooves *w*, brackets F, sliding therein and carrying the catch-hoops F, the forcing-heads E E, the arms G, jointed to the heads and provided with lugs *a*, the arm-section G', jointed to arm G and provided with stud *d*, swiveling rings G^2, arranged upon the heads and provided with cam-slots *c*, receiving studs *d*, and the bar G^3, connected to the swiveling ring for operating the same, substantially as shown and described.

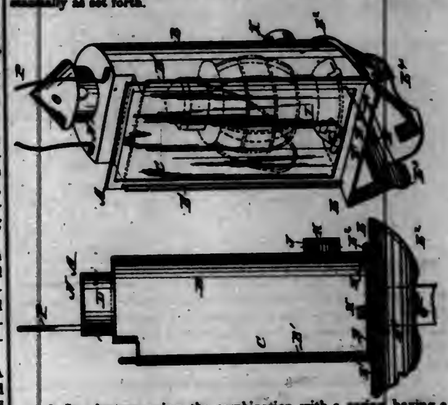
3. The combination of the bed-frame A, having shaft B, with gear-wheels C C, the large standards E^2, connected by rod I, small standards E', connected to the large standards at the top, the screw-shafts D', having right-and-left threads, and gear-wheels D, arranged between the large and small standards, and the heads E, having interiorly-screw-threaded hub, substantially as and for the purpose described.



4. The combination, in a barrel-machine, with the base-frame A and the oppositely-advancing heads E E, of the rods H, connected with the heads by slides to form guides, and having seats *h'* formed in the same to receive the barrel, substantially as described.

411,220. HAY-FORK. JOSEPH S. GOSHAWKE, East Berlin, Pa. Filed Apr. 9, 1889. Serial No. 306,891. (No model.)

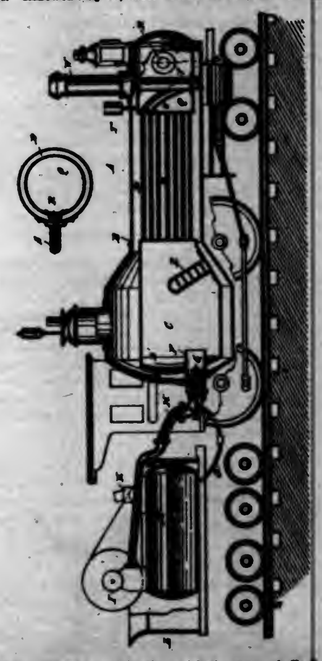
Claim.—The combination, with a skeleton frame provided with vertical side bars and a tine pivoted to the lower end of each of the said side bars, of a yoke or bow pivoted within the frame, above the center, connecting-rods pivoted to the bow, above its pivotal point, and to each of the said tines, a bracket secured to the under surface of the bow at the center, a spring-actuated bolt held to slide vertically through the said bracket and bow, and capable of engagement with the frame, and a rope attached to the said bolt, leading downward beyond the frame, all combined for operation substantially as herein set forth.



411,221. GAME BOARD OR APPARATUS. CHARLES GOOCH, Cincinnati, Ohio. Filed June 18, 1889. Serial No. 314,757. (No model.)

Claim.—The combination, with a target provided with rigid legs, of legs 12, hinged thereto, cross-strips 14 and 15, arranged between the legs 13, and a back or leaf 16, and the removable pins adapted to be received in the box formed by said legs, cross-strips, and leaf, substantially as described.

411,222. LANTERN. OLE HAMMELAND, Fort Shenton, Dak., assignor to himself and David F. Bidwell, same place. Filed Jan. 26, 1889. Serial No. 297,882. (No model.)

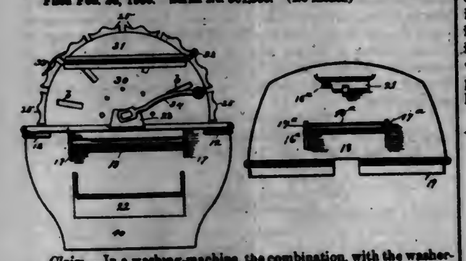


Claim.—1. A holder for a lantern, comprising a casing U-shaped in cross-section, and having a transparent slide in its front and a flange on its bottom, and a saddle provided with a platform having a marginal guideway to receive the flange of the bottom of the casing, substantially as set forth.

2. In a lantern-casing, the combination, with a casing having a flanged bottom, of the saddle E, provided with the apertured platform E', having guideways E^2 to receive the flange of the casing, and the spring-catch F on the under side of the platform, and having the upwardly-extending portion F' entering the aperture of the platform, substantially as herein shown and described.

3. The herein-described lantern-holder, consisting of the casing B, U-shaped in cross-section and provided with the vertical guideways B', the flange D' on its bottom, the catches H on its bottom, and the apertured pipes J L, the apertured caps K N, fitting on the said pipes, the transparent slide C, the apertured platform E, having the marginal guideway E^2, the saddle E^3, secured to the under side of the platform, and the spring-catch F on the under side of the platform, substantially as described.

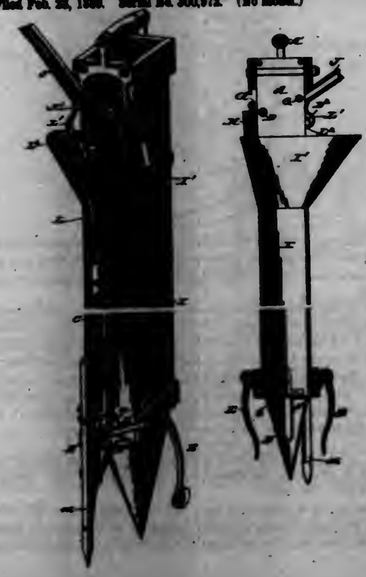
411,223. BOILER. ISAAC HULME, Yaquina, Oreg. Filed Aug. 18, 1888. Renewed July 16, 1889. Serial No. 317,857. (No model.)



Claim.—1. The combination, with the outer shell of a boiler and an inner shell forming a burning-chamber, of a water-arch extending into the said burning-chamber from the water-chamber of the boiler, a burner injecting a mixture of air and oil against the said water-arch in the burning-chamber, flues leading from the latter, a smoke-arch into which discharge said flues, an outwardly-opening valve held in the said smoke-arch to discharge the gases into the water-chamber of the boiler, and a safety-valve connected with the said smoke-arch, substantially as shown and described.

into the said burning-chamber from the water-chamber of the boiler, a burner injecting a mixture of air and oil against the said water-arch in the burning-chamber, flues leading from the latter, a smoke-arch into which discharge said flues, and an outwardly-opening valve held in the said smoke-arch to discharge the gases into the water-chamber of the outer shell, substantially as shown and described.

2. The combination, with the outer shell of a boiler and an inner shell forming a burning-chamber, of a water-arch extending into the said burning-chamber from the water-chamber of the boiler, a burner injecting a mixture of air and oil against the said water-arch in the burning-chamber, flues leading from the latter, a smoke-arch into which discharge said flues, an outwardly-opening valve held in the said smoke-arch to discharge the gases into the water-chamber of the boiler, and a safety-valve connected with the said smoke-arch, substantially as shown and described.

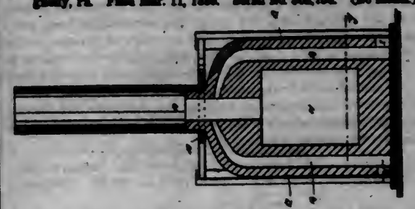


3. The combination, with the outer shell of a boiler and an inner shell forming a burning-chamber, of a water-arch extending into the said burning-chamber from the water-chamber of the boiler, a burner injecting a mixture of air and oil against the said water-arch in the burning-chamber, flues leading from the latter, a smoke-arch into which discharge said flues, an outwardly-opening valve held in the said smoke-arch to discharge the gases into the water-chamber of the boiler, pipes passing through the smoke-arch and connecting the steam-space in the boiler-shell with the steam-chests of the engines, and an exhaust-pipe passing through the boiler-shell and smoke-arch to the outside, substantially as shown and described.

411,224. STEAM-WASHER. WILLIAM KLAHR, Myerstown, Pa. Filed Feb. 28, 1889. Serial No. 301,530. (No model.)

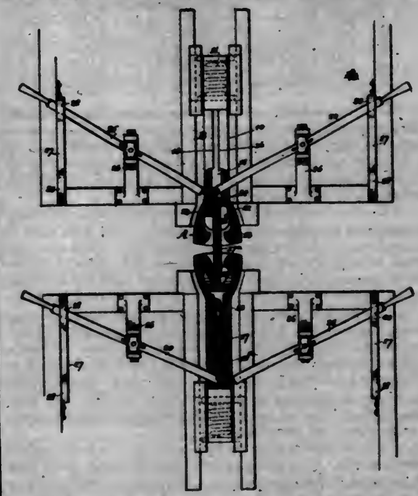
Claim.—In a washing-machine, the combination, with the washer-body 10, provided with the pockets 22, of the cover 18, provided with opening 18', and the flap 21, hinged to the cover above the said opening, substantially as and for the purpose set forth.

411,225. TRANSPLANTER. JACOB K. HERSHEY, JACOB S. HOSHAW, and JACOB HOSTETTER, Florin, Pa., and JOSHUA W. HARSH, Staunton, Va. Filed Feb. 23, 1889. Serial No. 300,972. (No model.)



Claim.—1. The combination, with the casing and the feed-tube, of the hinged shovels, the hinged coverers, the connecting-rods, the rods having the crank-arms and the single operating-lever, substantially as set forth.

2. In a transplanter, the combination, with the casing and the hinged shovels, of the spring guard-arms, arranged substantially as set forth.

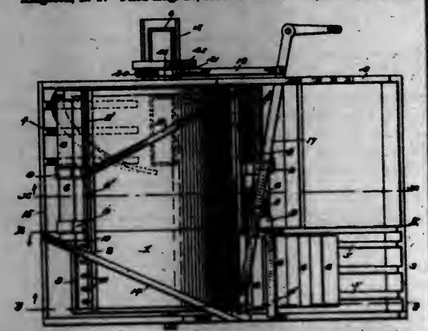


3. The combination, with the casing and the feed-tube, of the hinged shovels, the hinged coverers, the connecting-rods, the rods having the crank-arms, the coil-springs, the single operating-handle, and the spring-catch, substantially as set forth.

411,226. METALLURGICAL FURNACE. ORMSBY PEYTON, Allegheny, Pa. Filed Mar. 11, 1889. Serial No. 302,756. (No model.)

Claim.—A straight-draft metallurgical furnace 10, having a heating-chamber terminating in a neck 11 and a stack over the neck, the air-spaces 13 in the side walls of the neck extending above and below its floor-line, provided below the floor-line with the series of cold-air-inlet ports 2, opening through the outer side walls, and flues connecting the upper ends of the air-spaces with the interior of the furnace, whereby the draft will cause jets of cold air to be drawn through the ports 2 and impinged against the sides of the neck just below its floor-line, substantially as set forth.

411,227. CAR-COUPLING. JOHN W. REESOR, Watford, Province of Ontario, Canada. Filed May 21, 1889. Serial No. 311,626. (No model.)



Claim.—1. In a car-coupler, the combination, with a tubular draw-head, comprising a head having an opening in its bottom and a body adapted to extend rearward beneath the car, and provided with a longitudinal slot, and guideways at each side of the said slot, of a link adapted to travel upon the said guideways, and means, substantially as shown and described, for operating the said link, as and for the purpose specified.

2. In a car-coupler, the combination, with a tubular draw-head, comprising a head having an opening in its inner side, the forward wall of which opening is upwardly inclined, and a body portion adapted to extend beneath the car, provided with a longitudinal slot, and guideways at each side of the said slot, of a link comprising a cylindrical body and an arrow-head at each end, which heads are weighted at one side and reduced at the other to travel in the slot of the draw-head, all combined for operation substantially as shown and described.

3. In a car-coupler, the combination, with a tubular draw-head, comprising a head having an opening in its inner side, the forward wall of which opening is upwardly inclined, and a body portion adapted to extend beneath the car, provided with a longitudinal slot, and guideways at each side of the said slot, of a link comprising a cylindrical body and an arrow-head at each end, one side of which heads is weighted and the opposite side reduced to travel in the slot of the draw-head, the sides of the outer head being beveled in opposite directions, as and for the purpose specified.

4. In a car-coupler, the combination, with a tubular draw-head, comprising a head proper, having a downwardly-curved upper wall, an opening in its lower face, the forward wall of which opening is upwardly inclined, and a body portion adapted to extend beneath the car and provided with a longitudinal slot, and a guideway at each side of the said slot, of a link comprising a cylindrical body and a front and rear arrow-head, weighted at one side and reduced at the other to travel in the slot of the draw-head, the forward head at its sides being oppositely beveled, a cylindrical projection extending from the center of the rear head, jointed levers fulcrumed beneath the car, and an angular rod-connection between the said levers and the rear end of the reduced portion of the rear head of the link, substantially as and for the purpose specified.

411,228. BRICK-MOLD-SANDING MACHINE. GEORGE H. SMITH, Kingston, N. Y. Filed Aug. 27, 1888. Serial No. 283,806. (No model.)

Claim.—1. In a brick-mold-sanding machine, the combination, with a supporting-frame, of a rotary sand-box, a disk mounted on the shaft of the said box and provided with pins, a lever pivoted to one side of the frame and extending across the same, and a forked lever pivoted to the first-named lever and engaging the pins of the disk, substantially as herein shown and described.

2. In a brick-mold-sanding machine, the combination, with a supporting-frame provided with a feed and delivery chute and a guide 13, of a sand-box mounted to rotate in the frame and provided with openings in its periphery and with the diagonal guide-strips 16, and the curved guide-strip 14, secured to the frame and extending diagonally over the said box, substantially as and for the purpose set forth.

3. In a brick-mold-sanding machine, the combination, with a supporting-frame provided with a feed-chute at one corner and a delivery-chute at the diagonally-opposite corner, of a sand-box mounted to revolve in the said frame and provided with a series of openings in its periphery, a guide-strip for moving the molds over the openings in the box, means for retaining the molds over said openings, and guide-strips for discharging the molds into the discharge-chute, substantially as herein shown and described.

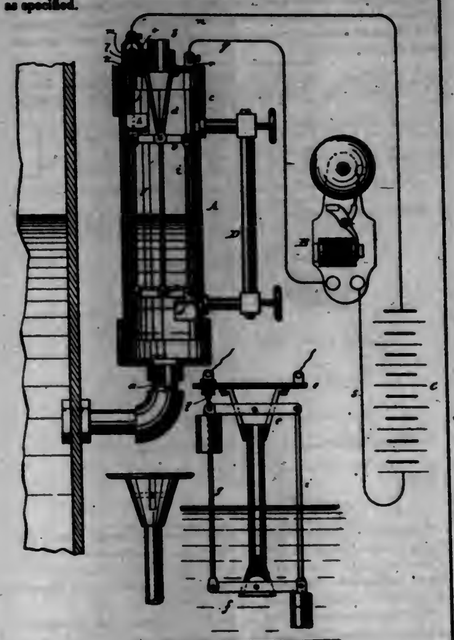
4. A brick-mold-sanding machine consisting of a frame having a feed-chute with a brick-mold support at its lower end, a rotary sand-box having sand-discharge openings in its periphery, brick-mold ways on the rotary sand-box in line with the sand-discharge openings, with retaining projections for holding the brick-molds over the sand-discharge openings and catches for lifting the bottom mold from feed-chute onto the brick-mold ways, a diagonal strip adjacent to the said box and extending over the latter from the feed-chute, diagonal strips at the other end of the sand-box, and a curved chute adjacent to said end diagonally opposite the feed-chute, with a lateral opening and discharge-chute, a stop and guide-strip at the lower end of curved chute, and mechanism for operating the rotary sand-box, substantially as shown and described.

5. A brick-mold-sanding machine consisting of a rotary sand-box having its periphery formed with sand-discharge openings, with brick-mold-retaining guides, brick-mold guideways extending from end to end of the sand-box in line with the openings, retaining-catches located adjacent to the sand-discharge openings and in line therewith on one end of the sand-box, diagonal strips on the sand-box extending over the same from the opposite end, a feeding-chute adjacent to the end of the sand-box, having retaining-catches, a chute on the opposite side of the sand-box adjacent to the end thereof, having a stop and guide-strip at its bottom, with an adjacent opening and chute, diagonal strips on the sand-box, and a diagonal strip extending above the sand-box from the feed-chute to the opposite side, substantially as shown and described.

6. A brick-mold-sanding machine consisting of a frame 2, having mounted therein the rotary sand-box or cylinder 1, with sand-discharge openings 7, the brick-mold retaining and guide straps 9 adjacent to openings 7, the guide-strips 8', extending past the openings 7 and to the end of the cylinder on one side of the openings and having a continuation on the other side formed by means of pins 10, a chute 3, formed of slats 3', with pins 5 at their lower end adjacent to the end of cylinder 1, on which are located pins 10, diagonal strips 16 on the opposite end of cylinder, a diagonal strip 14, extending over cylinder 1 from the chute 3 to the side of frame 2, a chute 4, located diagonally on frame 2 to chute 3, with lateral opening 11, a chute 12 in frame 2 at the bottom of chute 4, and a stop and guide-strip 13 adjacent thereto, substantially as shown and described.

7. A brick-mold-sanding machine consisting of a frame 2, a feed-chute 3, formed with slats 3', and pins 5 at the lower ends of the slats, located at an upper corner of frame 2, a chute 4, located at a corner of frame 2 diagonally to chute 3, an opening 11, with external chute 12, an internal stop and guide-strip 13 in the side of frame 2 at the bottom of chute 4, a rotary sand-box or cylinder 1, mounted in frame 2, with sand-discharge openings 7 in its periphery between chutes 3 and 4, brick-mold guide and retaining straps 9, located adjacent to the openings, brick-mold guide-strips 8', extending past the openings 7, pins 10, located on the cylinder at one side of the openings and extending to the end of the cylinder adjacent to chute 3, diagonal strips 16 on the cylinder at the end adjacent to chute 4, a diagonal strip 14, extending from the chute 3 over the cylinder to the opposite side of frame 2, and means for rotating the cylinder 1, substantially as shown and described.

411,229. STAND FOR CARBOYS. JAMES F. STEVENSON, Allegheny, Pa. Filed June 12, 1888. Serial No. 314,077. (No model.)



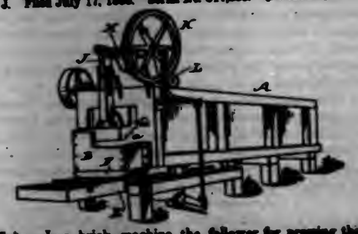
Claim.—1. A stand for carboys, consisting of the parallel rockers having the brace at their lower ends to engage the carboy and steps or bends at their upper ends to secure the carboy, substantially as described.

2. A stand for carboys, consisting of a wire bent to form rockers and having the lower closed end bent up to engage one of the lower edges of the carboy and their free ends formed with steps to engage one of the upper edges of the carboy, substantially as described.

3. The herein-described stand for carboys, consisting of the curved rockers having their lower ends turned up to form a brace for the carboy and their upper ends turned inward and formed with step-angles for securing the carboy, substantially as described.

411,230. ELECTRICAL HIGH AND LOW WATER ALARM. DANIEL H. STEBBINS, Norristown, Pa. Filed July 23, 1888. Serial No. 318,316. (No model.)

Claim.—In an electrical high and low water alarm, the combination, with the containing-vessel connected at the top and bottom with the main reservoir or boiler, of two levers *e f*, rods *g i*, connecting the said levers, floats *h j*, carried by the rods and arranged diagonally opposite each other, and the electrical connections, substantially as specified.

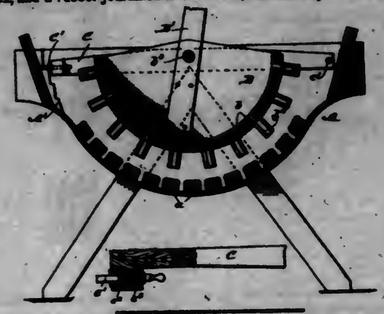


411,231. PROCESS OF THE MANUFACTURE OF ALCOHOLIC LIQUIDS. JOKICHI TAKAMINE, Tokio, Japan. Filed May 28, 1889. Serial No. 312,508. (No specimens.) Patented in England May 19, 1887, No. 7,577; in France Feb. 27, 1888, No. 183,988, and in Belgium Feb. 28, 1888, No. 80,786.

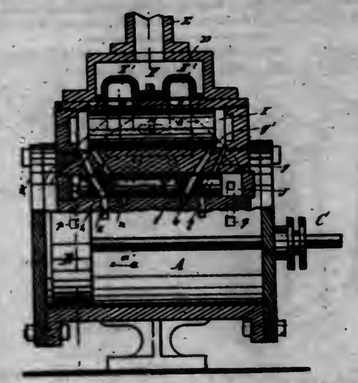
Claim.—1. The process of making alcoholic liquors, which consists in fermenting a suitable solution or wash with the aid of moyasi fungus and distilling the product, as herein set forth.

2. The process of making alcoholic liquors, which consists in fermenting a suitable solution or wash with a mixture of moto and koji and distilling the product, as herein set forth.

411,232. BRICK-MACHINE. GODFRYD VAN DEVENTER, Metuchen, N. J. Filed July 17, 1888. Serial No. 317,932. (No model.)



Claim.—In a brick-machine, the follower for pressing the clay into the molds, formed with its outer edge depressed or at a lower level than the opposite edge or edge next to the mixer, substantially as and for the purposes set forth.



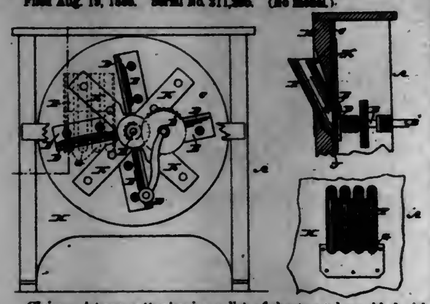
411,233. WASHING-MACHINE. IRA R. WARREN, Wesmere, Iowa. Filed Mar. 23, 1889. Serial No. 304,027. (No model.)

Claim.—1. In a washing-machine, the combination, with a suds-box A, of the stepped supports A', secured to one end thereof, the supporting-arms C, pivoted at the opposite end, the spring-bolts C', carried at the free end of the supporting-arms, and the rubber B, journaled near the center of the said arms, substantially as shown and described.

2. The combination, in a washing-machine, of a suds-box, arms pivoted at one end to the inner sides of the suds-box and carrying catches at their free ends that engage supports therefor on the said box, and a rubber journaled in said arms, substantially as described.

411,234. STEAM-ACTUATED VALVE. WILLIAM L. G. WILLIAMS, Jersey, Pa. Filed Dec. 12, 1888. Serial No. 293,245. (No model.)

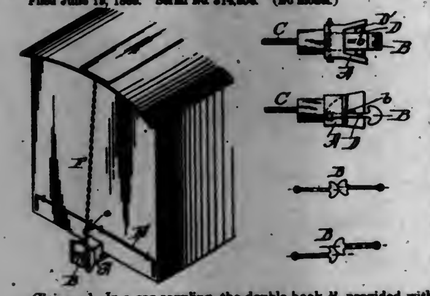
Claim.—1. In a steam-actuated valve, the combination, with a cylinder and its piston, of a steam-chest communicating with the cylinder, an oscillating valve in the steam-chest, and an auxiliary piston below the steam-chest and connected with the said valve, the said auxiliary piston being operated by live steam from the cylinder, substantially as described.



2. In a steam-actuated valve, the combination, with a main valve mounted to turn and provided with an arm, of an auxiliary piston operated by live steam from the cylinder and provided with a pin engaging the said valve-arm, substantially as shown and described.

3. In a steam-actuated valve, the combination, with a main valve mounted to turn and provided with an arm, of an auxiliary piston operated by live steam from the cylinder and provided with a pin engaging the said valve-arm, and a second auxiliary piston actuated by live steam and controlling the motion of the said first auxiliary piston, substantially as shown and described.

4. In a steam-actuated valve, the combination, with a cylinder and a piston operating therein, of a steam-chest provided with inlet and outlet ports, the former leading to the said cylinder, a valve mounted to turn in the said steam-chest and operating over the said ports, an auxiliary piston connected with the said main valve for turning the same, and an auxiliary cylinder controlling the said auxiliary piston and in communication with the said cylinder, substantially as shown and described.

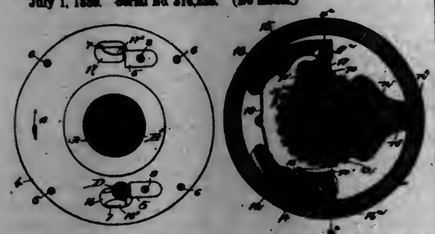


5. In a steam-actuated valve, the combination, with a cylinder and a piston operating therein, of a steam-chest provided with inlet and outlet ports, the former leading to the said cylinder, a valve mounted to turn in the said steam-chest and operating over the said ports, an auxiliary piston connected with the said main valve for turning the same, an auxiliary cylinder containing the said auxiliary piston, a second auxiliary cylinder held parallel with the said first-named auxiliary cylinder and connected with the same by inlet and outlet ports, and also connected by ports with the main cylinder, and a second auxiliary piston held to slide in the said auxiliary cylinder and provided with ports for connecting the said exhaust and inlet ports of the second auxiliary cylinder with the said main cylinder and with the main exhaust-ports, substantially as shown and described.

411,285. BEAN-CUTTER. GERHARD RUDOLPH, Philadelphia, Pa. Filed Aug. 19, 1889. Serial No. 321,285. (No model.)

Claim.—A bean-cutter having a disk of sheet metal provided with slots, blades secured to the walls of the slots and having their edges bent laterally in the direction of the feed-chutes, and a series of arms integral with each other and alternating with the slots, and a casing with vertical grooves, and a feed-chute with corrugations coinciding with said grooves, said parts being combined substantially as described.

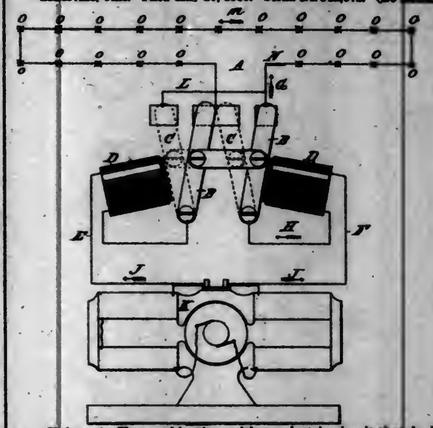
411,286. CAR-COUPLING. WILLIAM H. BURWELL, Sparta, Ga. Filed June 19, 1889. Serial No. 314,853. (No model.)



Claim.—1. In a car-coupling, the double hook B, provided with lugs D D, substantially as shown, and for the purpose specified.

2. In a car-coupling, draw-head A, double hook B, and lugs D and D', all combined, arranged, and operating substantially as shown and set forth.

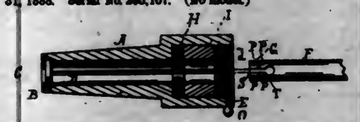
3. In a car-coupling, the combination of the draw-head A, hook B, and link G, all combined and operating substantially as shown and described, and for the purpose specified.



411,287. CLUTCH. WALTER B. CLIFFORD, Fitchburg, Mass. Filed July 1, 1889. Serial No. 316,228. (No model.)

Claim.—1. The combination, with a shaft adapted to be rotated in one and then in an opposite direction and a disk or crank loose thereon, of a clutch composed of a toothed wheel and pawls to engage the teeth of the wheel to positively connect the said disk or crank and the said shaft for but a portion of its first rotation in either direction, and then to automatically disengage the said clutch and leave the said disk or crank disconnected from the said shaft until the direction of rotation of the said shaft is changed, to operate substantially as described.

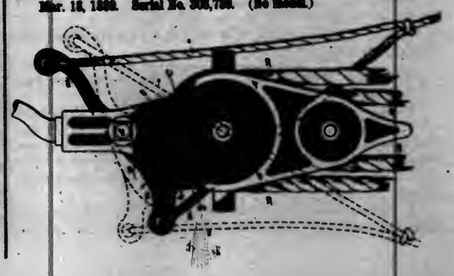
2. The combination, with a shaft adapted to be rotated in one and then in an opposite direction and a disk or crank loose thereon, of a clutch composed of a toothed wheel or gear fast on the said shaft and levers and clutch-pawls, and with means to release from the said wheel after but a partial rotation of the said shaft that one of the said pawls which acts as its driver, whereby the said shaft at the commencement of its rotation in either direction is enabled to positively start the disk or crank and move the same with it for but part of a rotation of the said shaft, at which time the pawl is released and the disk or crank remains at rest, while the shaft continues to rotate, substantially as described.



411,288. AUTOMATIC POLE-CHANGER. CYRUS A. EGBERT, Zanesville, Ohio. Filed May 20, 1889. Serial No. 312,072. (No model.)

Claim.—1. The combination, with an electric circuit that is designed to have its current flow through it in one direction at all times, of an automatic electric-current pole-changing device connected in the circuit between the dynamo-electric machine or battery and electric appliances in the circuit, substantially as set forth.

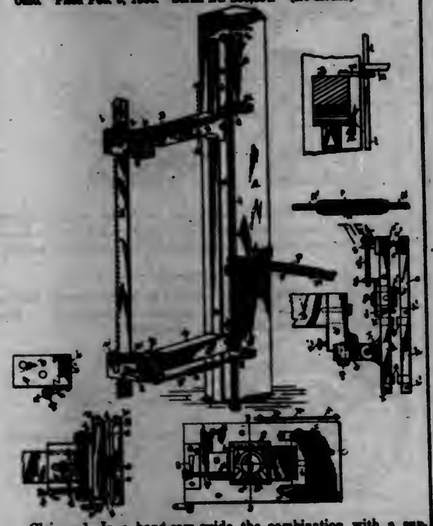
2. The combination, with an electric appliance that is designed to have its current flow through it in one direction at all times, of an automatic electric-current pole-changing device connected between the appliance and its working circuit, so that the current will flow through said pole-changer in passing to and from the appliance.



411,289. BUNG. MATHEW DELKER, Detroit, Mich. Filed Dec. 31, 1888. Serial No. 295,107. (No model.)

Claim.—1. In combination with a bung having an opening therethrough, a stopper arranged to close the opening at its lower end, said stopper having a supporting-rod projecting from its upper surface and arranged to extend upward through the bung and to lock the stopper thereto by frictional contact between the upper end of said rod and a dent cut through the walls of the bung, substantially as and for the purposes described.

2. The combination of a bung having an opening through it, a stopper arranged to close the lower end of the opening, a supporting-rod extending upward from the stopper and having a knob at its upper extremity, and the described slotted nipple connected to the pump-stem and arranged to receive and hold the said supporting-rod by means of the knob, substantially as and for the purpose described.

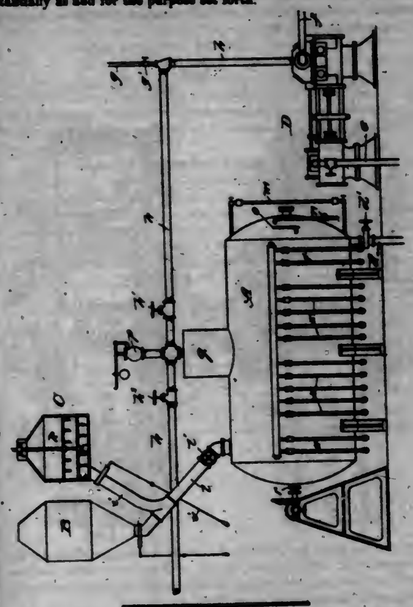


411,240. TACKLE-BLOCK. JAMES DUNN, Cleveland, Ohio. Filed Mar. 18, 1889. Serial No. 303,780. (No model.)

Claim.—1. A tackle-block and sheave, in combination with a locking device for the rope that works over the sheave, having a heel adapted to be in contact with the rope when the locking device is disengaged, an engaging-surface grooved longitudinally and convex between its ends to conform substantially to the outline of the sheave, with arms at each end of the device to attach controlling-cords, substantially as set forth.

2. In a tackle-block, the combination of the block, the sheave, and a hoisting-rope with a locking device for the rope pivoted in the block over the sheave and having the following distinguishing features: a convex grooved and ribbed engaging-surface adapted to the hoisting-rope and the sheave, a heel to make contact with the rope and draw the locking device into position, and arms extending in opposite directions to operate the locking device, substantially as set forth.

411,241. BAND-SAW GUIDE. HANNIBAL D. FIELDS, Columbus, Ohio. Filed Feb. 9, 1889. Serial No. 299,351. (No model.)



Claim.—1. In a band-saw guide, the combination, with a supporting-arm B, projecting from a column, of the connected guide-block plates c, friction-roller e, pivoted between said plates, saw-bearing strips H, having their upper beat ends adjustably clamped, as described, by strips h against the upper side of said plates c, the rear plate c being adjustably connected, as described, with said arm B, substantially as and for the purpose set forth.

2. In a saw-guide, the combination, with the connected plates c of the guide-block C, one of said plates c having a slot D, provided with an enlarged inner end, cleats d^2 above and below said enlargement, and plate F, having outwardly-projecting arm g, said plate being detachably secured to said plate c of the frame d, having half-bearing box d' and projecting arm f', bearing-box cap d^3, detachably secured on said half-bearing box and forming in connection therewith a bearing for shaft e of wheel e, and screw g', connecting said arms g and f', substantially as and for the purpose specified.

411,242. PROCESS OF BREWING ALE, BEER, AND PORTER. LOUIS FIRMIN, Chicago, Ill. Filed Apr. 4, 1888. Serial No. 269,622. (No model.)

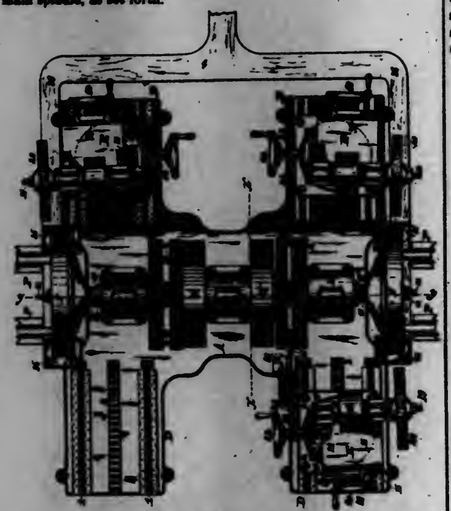
Claim.—1. In the manufacture of beer, ale, and porter, the process of preparing the mash, which consists in mashing the cereal and boiling it under steam-pressure, removing the steam-pressure and lowering the temperature of the mash to a degree at which the diastase of malt will effect the desired conversion, mixing malt with the cooled cereal mash and stirring the mixture until the desired quantity of saccharine matter has been produced, and finally drawing off into a mash-tub and adding more malt to the mash, substantially as and for the purpose set forth.

2. In the manufacture of beer, ale, and porter, the process of preparing the mash, which consists in mashing the cereal and boiling it under steam-pressure, allowing the mash to rest, then removing the steam-pressure, then producing a vacuum on the mash, mixing malt with the cereal mash, and stirring the mixture until the desired quantity of saccharine matter has been produced, raising the temperature of the mixture, drawing off into a mash-tub, and adding more malt, substantially as and for the purpose set forth.

411,243. PROCESS OF RELIGHTING THE FLAME IN HYDRO-CARBON-FURNACES. CHARLES L. GOODRIDGE, Portland, Me. Filed Apr. 20, 1889. Serial No. 308,004. (No model.)

Claim.—1. The herein-described process of producing and sustaining an auxiliary flame for relighting a principal hydrocarbon or other flame, which consists in heating a mass of refractory material by placing it in contact with said principal flame and then conducting into contact with said refractory material a substantially-continuous supply of inflammable material independent of the main supply, substantially as shown.

2. The herein-described process of producing and sustaining an auxiliary flame for relighting a principal hydrocarbon or other flame, which consists in placing a mass of refractory material in contact with said principal flame and then continually dropping upon said refractory material a supply of inflammable material independent of the main supply, substantially as shown.



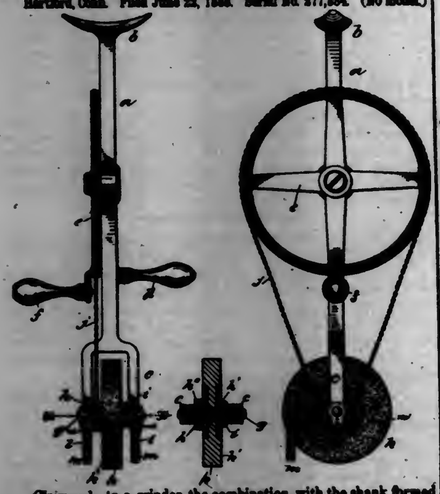
411,244. CAR-WHEEL GRINDER. PATRICK H. GRIFFIN, Buffalo, N. Y. Filed Mar. 1, 1888. Serial No. 301,573. (No model.)

Claim.—1. In machines for truing up the treads and flanges of car-wheels, the combination, with an H-shaped bed-plate, of a series of standards carrying the main spindle above and a fixed shaft below, a driving-pulley having a pinion, a spur-wheel engaging said pinion and fixed to a sleeve having a pinion engaging a spur-wheel fixed to the main spindle above, and a suitable number of slide-rests carrying emery-wheels, as described, for the purpose set forth.

2. In machines for grinding the treads and flanges of car-wheels, the combination, with the base-plate, of the head, consisting of two standards having the main spindle above and fixed counter-shaft below, said main spindle having the driving-pulley, with its pinion, the counter-shaft having the pinion and spur-wheel, the spur-wheel on said main spindle, the driving-pins in said spur-wheels, the slide-rests having emery-wheels, and the feed mechanism operated by said pins and connected with said slide-rests, as and for the purpose set forth.

3. In machines for grinding the treads and flanges of car-wheels, the combination, with an H-shaped bed-plate, of a series of standards carrying the main spindle above and a fixed shaft below, a driving-pulley having a pinion, a spur-wheel engaging said pinion and fixed to a sleeve, a pinion engaging a spur-wheel fixed to the main spindle,

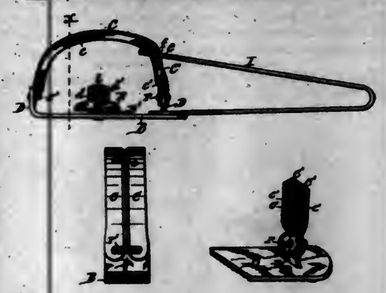
and a suitable number of slide-rests carrying emery-wheels, said main spindle having expansible mandrels outside of the outer standards, as described, whereby the car-wheels are chucked directly to the said main spindle, as set forth.



4. In machines for grinding the treads and flanges of car-wheels, the combination of the main spindle with an expansible mandrel thereon and jaws, a collar, and a revolving screw-spindle for actuating said mandrel, substantially as set forth.

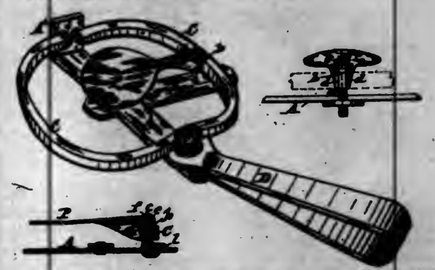
5. The combination, with the spindle G G', having the spur-wheel M M', provided with the pins 29, of the lever 28, pivoted to the standard 27, the connecting-rod 30, lever 24, having pivoted pawl 25, spring 26, and the ratchet-wheel 23, and feed-screw 21, as set forth.

6. The combination, with the feed-screw 21, having the ratchet-wheel 23 and lever 24, of the pawl 25, having its tail engaged by the U-shaped spring 26, as and for the object set forth.



411,245. MOWING-MACHINE-KNIFE GRINDER. OWEN H. JONES, Hartford, Conn. Filed June 22, 1888. Serial No. 277,884. (No model.)

Claim.—1. In a grinder, the combination, with the shank formed with a bifurcated lower end, the branches of which are formed with opposite bearings, of a spindle engaged in said bearings, a sleeve secured upon said spindle and provided with an integral pulley at one end, a nut engaged upon the opposite end of said sleeve, an abrading-wheel secured to said sleeve between said nut and said pulley, a drive-wheel, and a connection between said drive-wheel and the pulley, substantially as set forth.



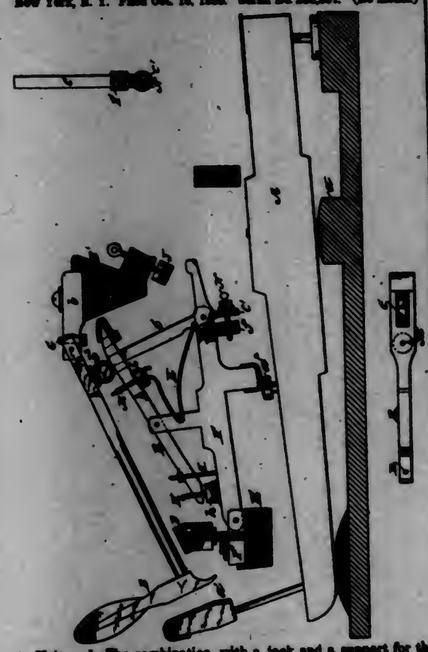
2. In a grinder, the combination, with a shank *a*, provided with a bifurcated lower end having opposite journal-bearings, of a spindle engaged in said bearings, an abrading-wheel rotating about said spindle, bearings provided at the lower ends of the bifurcated ends at right angles to the spindle-bearings, T-shaped shoes having their legs *n'* adjustably secured in said bearings, and means for rotating the said abrading-wheel, substantially as set forth.

411,246. ANIMAL-TRAP. HARRY B. KELLEY, Niagara Falls, assignor to the Oneida Community, (Limited,) Community, N. Y. Filed Jan. 11, 1889. Serial No. 296,022. (No model.)

Claim.—As an improved article of manufacture, the trap-jaws C C, formed of blanks of sheet metal bent into bow shape and crimped transversely to present broad gripping-faces, substantially as set forth and shown.

411,247. ANIMAL-TRAP. HARRY B. KELLEY, Niagara Falls, assignor to the Oneida Community, (Limited,) Community, N. Y. Filed Feb. 23, 1889. Serial No. 300,904. (No model.)

Claim.—1. In combination with the trap-base and spring-actuated jaws, a post connected to the base and oscillatory thereon and provided with a catch adapted to engage one of the jaws, and a lever fulcrumed on the said post and adapted to throw the post from the engaged jaw, as set forth.



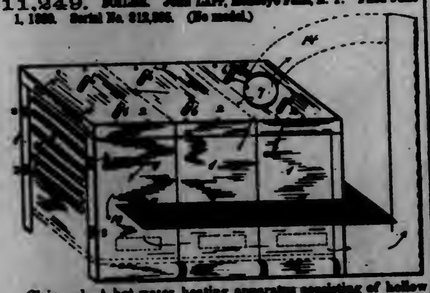
2. In combination with the trap-base and spring-actuated jaws, a post hinged to the base at a point directly under one of the jaws when in its set position and provided with a catch adapted to hold said jaw in said position, and a lever hinged to the said post and having one end bearing on the engaged jaw at the side adjacent to the post, as set forth.

3. In combination with the base A and jaw C, the post *a*, hinged to the base at a point directly under said jaw when in its set position and formed with the catch *b* and shoulder *c*, and the bait-pan formed with ears *e e*, hinged to and embracing the post, hooks *d d* at opposite sides of the post, and abutment *f* between the ears, substantially as described and shown.

4. In combination with the trap-base and spring-actuated jaws, the post *a*, hinged to the base and standing at the inner side of the jaw and formed with a catch adapted to hold the jaw in its set position, and with a stop to limit the outward movement of said post, and the bait-pan fulcrumed on said post and adapted to throw the same out of its engagement with the jaw, as set forth.

5. In combination with the trap-base and spring-actuated jaws, the post *a*, hinged to the base and standing at the inner side of one of the jaws when in its set position and formed with the stop *l*, catch *b*, and shoulder *c*, and the bait-pan P, formed with perforated ears *e e*, embracing the head of the post and hinged thereto, the hooks *d d*, adapted to bear on the inner side of the aforesaid jaw, and the abutment *f* on the bait-pan between the aforesaid ears, substantially as described and shown.

411,248. PIANO-ACTION. BENJAMIN KRAKOWER and JACOBUS RAAS, New York, N. Y. Filed Oct. 16, 1888. Serial No. 288,267. (No model.)



Claim.—1. The combination, with a jack and a support for the jack, of a projection, arm, or eye extending from the jack, a projection extending from the support of the jack, and a screw having a head acting against the projection, arm, or eye of the jack and engaging with the projection on the jack-support, substantially as specified.

2. The combination, with a jack and a support for the jack, of a projection, arm, or eye extending from the jack, a projection extending from the support of the jack, and a screw extending below the forward arm of the jack passing through the projection, arm, or eye of the jack and engaging with the projection on the jack-support, substantially as specified.

3. The combination, with a jack, a support for the jack, and a repeating-lever, of a spring having connection with the jack and its support, and an adjustable block on the repeating-lever bearing on one end of said spring, substantially as specified.

411,249. BOILER. JOHN LAFF, Kenosyo Falls, N. Y. Filed June 1, 1889. Serial No. 312,886. (No model.)

Claim.—1. A hot-water heating apparatus consisting of hollow sides, hollow ends, and hollow top secured together and communicating with each other through coincident ports in their vertical meeting edges, of the side ports in the lower face of the top adjacent to the outer edges and coinciding with ports in the upper edge of the sides, and water inlet and outlet pipes, and a grate and fire-pot, substantially as described.

2. A hot-water heating apparatus comprising sides and ends and top in separate sections secured together, and all being hollow and communicating together internally, and a grate and fire-pot, a casing, and a horizontal partition between the sides and ends and the casing, constituting a reverse flue, and a partition across the top provided with a damper, in combination, substantially as described.

3. A heating apparatus consisting of hollow side sections in separate pieces, hollow ends, and hollow top sections secured together and communicating with each other internally, and tubes extending from the sides into the top of the combustion-chamber and nearly across it, a grate and fire-pot, water inlet and outlet pipes, and an external casing creating flues exterior to the sides and ends and above the top, substantially as described.

4. A hot-water heating apparatus consisting of a hollow side piece, a hollow back, a hollow top provided with an opening for escape of the products of combustion, a hollow front, the sides, back, front, and top being secured together, and all communicating with each other internally, one section being cut away on one edge, and its meeting section being cut away in like manner, and means for closing the opening, and a casing and a partition between the casing and the walls of the apparatus, and water inlet and outlet pipes, substantially as described.

5. A section for a wall of a hot-water heating apparatus, comprising a vertical portion and an inwardly and downwardly contracted portion, all hollow and integral, and provided with ports in the edges to connect it to the adjoining section, and flanges for securing the lower end to the adjoining section, substantially as described.

411,250. WAISTBAND FOR TROUSERS. JOHN H. LEAVITT, Boston, Mass. Filed July 15, 1889. Serial No. 317,542. (No model.)

Claim.—1. The combination, with trousers, of a waistband curved in the direction of its length and provided with a longitudinal slit and secured to said trousers at its opposite ends and between its opposite ends and the ends of the slit, substantially as described.

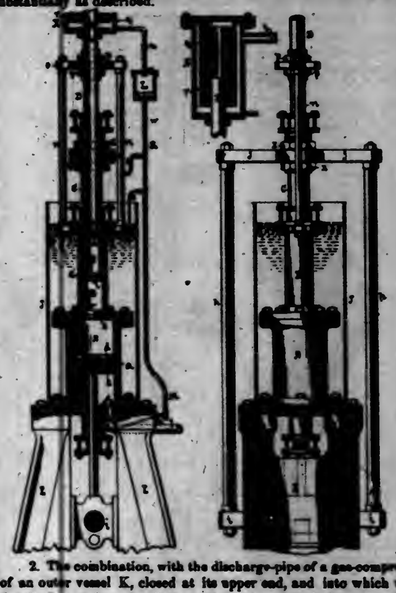
2. The combination, with trousers, of a waistband curved in the direction of its length and provided with a curved longitudinal slit and secured to said trousers at its opposite ends and between its opposite ends and the ends of the slit, substantially as described.

3. The combination, with trousers, of a waistband curved in the direction of its length and provided with a curved longitudinal slit and having button-holes and stitched to the trousers at its ends and lower edge and transversely between the ends of the said band and the ends of the slit, and elastic secured to the upper and lower slitted portions of the waistband, substantially as described.

4. The waistband herein described, it consisting of two strips of cloth curved in the direction of their length and secured together at their edges, and provided with a longitudinal curved slit and having button-holes and elastic tapes secured to the upper and lower slitted portions of the waistband independent of the said button-holes, the

said elastic tape being interposed between the end of the slit and the button-hole in the upper slitted portion adjacent to the end of the said slit whereby tearing of the end of the slit is obviated, substantially as described.

411,251. PULP-BEATING ENGINE. EDWARD B. MARSHALL, Turner's Falls, Mass., assignor to the Marshall Engine Company, same place. Filed July 9, 1888. Serial No. 279,305. (No model.)

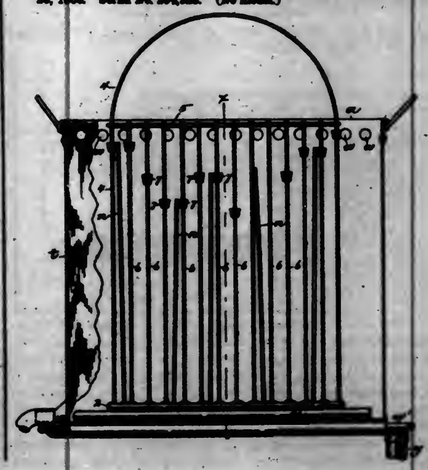


Claim.—1. In a pulp-beating machine substantially such as described, the combination of the revolving disk K, the stationary plate G, longitudinally adjustable upon the outside of the case and toward or from the said revolving disk, two or more adjusting-screws N, supported in stationary bearings on the case against longitudinal movement, but free for revolution, said screws tapped into the said plate, the said screws each provided with a toothed pinion, with a circular rack constructed to engage the pinions of the several screws, substantially as specified, and whereby under the rotation of the said rack the said screws will impart longitudinal adjustment to the said stationary plate G toward or from the revolving disk.

2. The combination of the case A, constructed with a feed-opening *a'* and one or more feed-openings, as *b*, between said feed-opening *a'* and the delivery end of the machine, the said case gradually increasing in diameter from the said feed-opening toward the delivery end, the revolving cone F within the case, the interior of the case and the surface of the cone constructed with corresponding longitudinal grinding-ribs, the longitudinal adjustable plate G at the delivery end of the machine, the cap L, secured to said plate and forming a chamber at the delivery end of the machine, and the revolving disk K in the said chamber, all substantially as described.

3. In a pulp-beating engine, a conical case, combined with a corresponding revolving cone upon the inside, the cone and case constructed with corresponding cutting or beating ribs, the case constructed with a feed-opening at its smaller end and with a chamber *d* in the bottom of the case at the smaller end opening directly from the case, substantially as and for the purpose described.

411,252. COMPOUND COMPRESSOR. GORDAY MEIKLEJOHN, Newark, N. J. Filed Nov. 10, 1888. Serial No. 291,267. (No model.)



Claim.—1. In a triple-compression machine, a first fixed cylinder A, containing a reciprocating piston provided with a valved transverse passage *c* and having a cylinder-head provided with a valved passage *c*, a second cylinder B, of smaller diameter, supported upon said cylinder-head and communicating with the first cylinder through the valved passage *c*, a stationary discharge-pipe D, with a valved passage *m* at its lower end, and a reciprocating plunger-cylinder C, with a valved passage at its lower end, said plunger-cylinder forming the plunger for the second cylinder B, and also forming a reciprocating cylinder, for which the discharge-pipe D forms a stationary plunger, substantially as described.

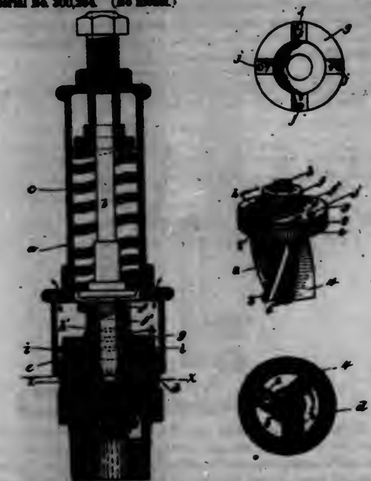
2. The combination, with the discharge-pipe of a gas-compressor, of an outer vessel K, closed at its upper end, and into which vessel the discharge-pipe extends to near the upper end thereof, an inner hollow cylinder *q*, surrounding the discharge-pipe and forming therewith a space for the reception of the filtering material, an outlet near the upper end of the vessel K for the passage of the gas, and an outlet near the bottom of the vessel for the passage of the oil, substantially as described.

3. In a gas-compressor, the combination, with the discharge-pipe, of an outer vessel K, closed at its upper end, and into which vessel the discharge-pipe extends to near the upper end thereof, an inner hollow cylinder surrounding the discharge-pipe and forming therewith a space for the reception of the filtering material, an outlet near the upper end of the vessel K for the passage of the gas, an outlet near the bottom of the vessel for the passage of the oil, an oil-cup connected with the latter passage, and a distributing-pipe leading from the oil-cup, substantially as described.

411,253. APPARATUS FOR HOLDING AND WASHING PHOTOGRAPHIC NEGATIVES. WILLIAM K. MOODY, Boston, Mass. Filed Dec. 20, 1888. Serial No. 294,222. (No model.)

Claim.—1. In an apparatus for holding and washing photographic negatives, a support or holder composed of a base having a series of supports for the lower edge of each negative, and a series of uprights attached to said base and arranged to support the central portions of the upper edges of the negatives resting on the base, as set forth, said lower edges of the negatives resting midway between the said uprights.

2. In an apparatus for holding and washing photographic negatives, a support or holder composed of a base having bars or rods in which are depressions or grooves for the reception of the lower edges of a series of negatives, and substantially vertical rods secured to said base and arranged to support the upper portions of the negatives, as set forth, said depressions or grooves being midway between said vertical bars, as stated.



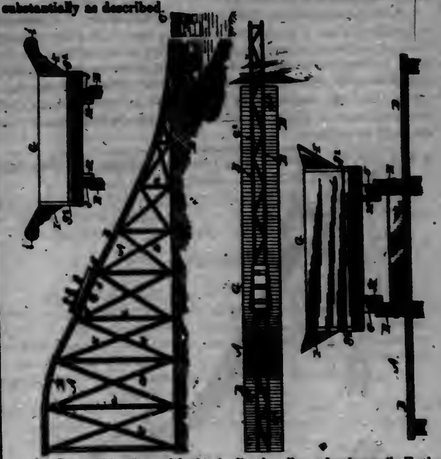
3. The negative-support composed of the marginal frame 2, the corrugated cross-rods 3, secured thereto, said frame and rods constituting a base, and the bail 4 and upright rods 6, secured to said base, as set forth.

4. The negative-support composed of a base to support the lower edges of a series of negatives, and a series of uprights secured to said base, and adjustable collars on said uprights or on a part thereof, as set forth.

5. A tank having water-supply pipes at its lower portion arranged to throw currents of water obliquely against or toward the sides of the tank, and a plurality of escape-openings in its upper portion arranged to conduct the water from the tank in opposite directions without neutralizing said currents, as set forth.

6. A tank having the pipes *u u* on its bottom, said pipes having nozzles or perforations arranged at such angles as to throw the water against or toward the sides of the tank, combined with the negative-support composed of the base adapted to rest on said pipes and the upright rods secured to said base, as set forth.

411,254. POP SAFETY-VALVE. HUBBOCK HOBBS, Boston, Mass., assignor of one-half to Thomas Haley, same place. Filed Feb. 18, 1888. Serial No. 300,264. (No model.)



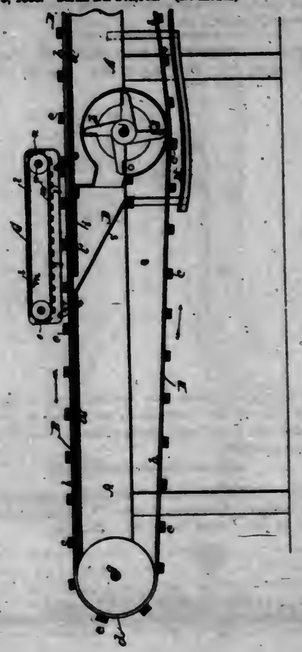
Claim.—1. In a pop safety-valve, the combination, with the valve-seat *d*, valve *c*, and spring-depressed spindle *b*, of the spiral wings 2 3 4, attached to the valve, whereby the force of the escaping steam is caused to rotate the valve, and the collars *f' f*, attached, respectively, to the valve and spindle and provided upon their adjacent sides with teeth or inclines, whereby the rotation of the valve is checked or limited, as set forth.

2. In a pop safety-valve, the combination, with the valve-seat *d* of the valve *c*, having openings *i*, and the plate *g*, adjustably secured to the valve and provided in its under side with grooves, as 6 7 8 9, and openings *j*, extending from said grooves through the top of the plate, as set forth.

411,255. COASTER. JOHN P. HEWBURN, Rock Island, Ill. Filed Oct. 26, 1888. Serial No. 288,978. (No model.)

Claim.—1. In an inclined pleasure-railway, in combination with an inclined way and track which is located or erected near a body of water, a boat-shaped car or toboggan adapted, when it reaches the foot of the incline, to enter and float forwardly on the water, substantially as described.

2. In combination with an inclined railway which is located with its foot near a body of water, a boat-shaped car or toboggan adapted to move downwardly over said inclined railway and entering the water at its foot to float thereon and be propelled forwardly thereon by the momentum derived from its descent over the inclined railway, substantially as described.



3. In combination with the inclined railway having rails E, the boat-shaped car or toboggan having runners and guide-plates extending below said runners on its bottom, substantially as described.

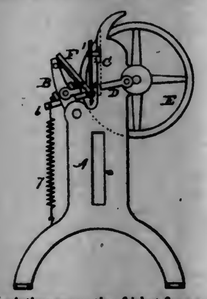
4. In combination with the boat-shaped car or toboggan, the spray-deflectors fixed to its sides, substantially as described.

5. In combination with the boat-shaped car or toboggan, the spray-deflectors and the convoluted plates fixed thereto, substantially as described.

6. In combination with an inclined railway which may be located near a body of water, a boat-shaped car or toboggan having runners J, guard-plates K, and spray-deflectors I, substantially as described.

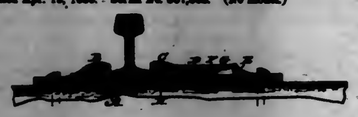
411,256. GRAIN-SEPARATOR. JAMES PATER, St. Paul, Minn. Filed May 5, 1888. Serial No. 273,062. (No model.)

Claim.—1. In combination with a straw-carrier, a chaffer consisting, essentially, of a series of longitudinal wires, a grain-chute under the same, a fan adapted to force an air-blast upward through the grain-chute and between the wires, and a straw-separator consisting of an endless chain of slats located over the chaffer and the straw-carrier, substantially as set forth.



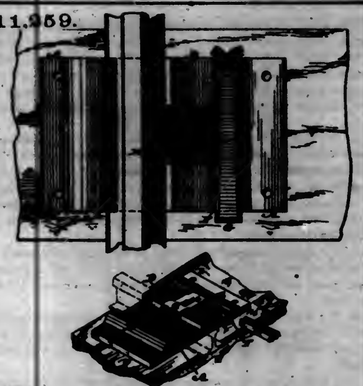
2. A straw-carrier, a chaffer consisting, essentially, of a series of longitudinal wires, a grain-chute under the same, and a fan adapted to force an air-blast upward through the grain-chute and between the wires, in combination with a vertically-adjustable straw-separator located over the chaffer and straw-carrier, said straw-separator consisting of a frame connected by pivoted links to the main frame, and an endless chain of slats mounted in said straw-separator frame, substantially as set forth.

411,257. SHOVEL. JOHN PFEIFER, Philadelphia, Pa. Filed Aug. 30, 1888. Serial No. 284,172. (No model.)



Claim.—As a new article of manufacture, a shovel consisting of a tubular handle, a pad, and a blade, all formed of a single piece of sheet or wrought metal, a filling in said handle, and a grip with neck entering said handle and secured thereto, said parts being combined substantially as described.

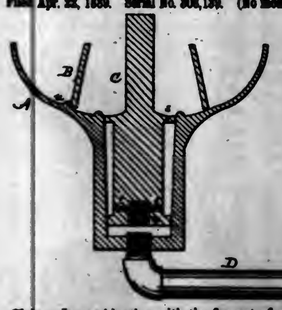
411,258. PRINTING-PRESS HAND-PROTECTOR. CHARLES REINEMEYER, Dayton, Ohio. Filed May 10, 1889. Serial No. 310,269. (No model.)



Claim.—In a printing-press, the frisket-fingers having pivoted thereto plates 2 2, with their respective arms 3 and 4 in combination with the platen and bed of said printing-press, substantially as and for the purpose specified.

411,259. RAILROAD-CHAIR. GEORGE W. RITTENHAUS, Philadelphia, Pa., assignor of two-thirds to Robert B. Rittenhaus, same place. Filed Apr. 19, 1889. Serial No. 307,822. (No model.)

411,259.

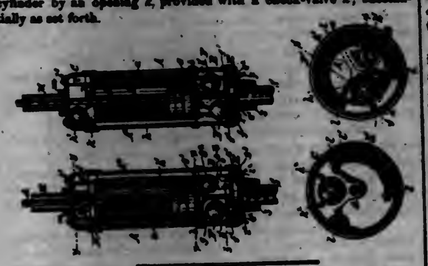


Claim.—1. A railroad-chair having a movable cheek-piece, and a key which engages with said piece, said key being connected with said cheek-piece and a shoulder on the base by a dovetailed joint, and said cheek-piece being also connected with its guide by a dovetailed joint, the parts being combined substantially as described.

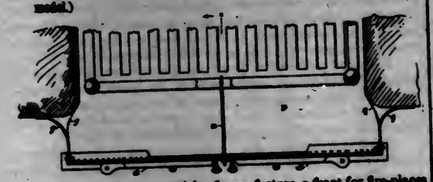
2. A railroad-chair having a base with a stationary cheek-piece, a guiding-piece and a shoulder rising therefrom, a movable cheek-piece with tongue adapted to engage in a recess in the rail, and a key adapted to bear against the movable cheek-piece, said parts being combined substantially as described.

3. A railroad-chair consisting of a base part having a stationary cheek-piece, a guiding-piece and a shoulder, the said guiding-piece having a transverse groove with inclined walls, a movable cheek-piece working in said groove and having a lip on one end, a tapering key in the channel between the shoulder and guiding-piece, said parts being combined substantially as described.

411,260. HYDROCARBON-BURNER. TERRY ROUT, Dayton, Ohio. Filed Apr. 22, 1889. Serial No. 308,139. (No model.)



Claim.—In combination with the fire-pot of a stove, the burner comprising a bowl-shaped case having a depending part, to which is connected a supply-pipe, and in which is snugly fitted the plug having an annular recess turned therein, and having a series of orifices in the lower end to admit oil into said recessed part and a series of orifices in the top of the same to admit the escape of vapor from said recess to the space within said bowl, substantially as shown and described.

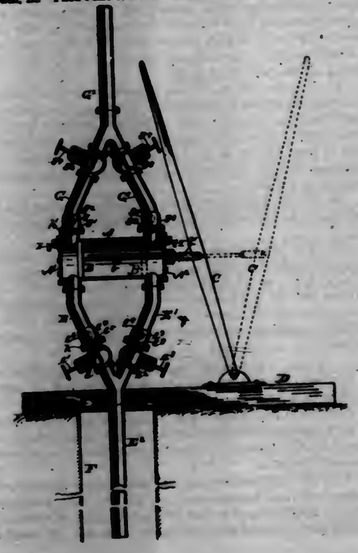


411,261. DOUBLE-ACTING FORCE-PUMP. JOHN SCHLAICHER, Lancaster, N. Y., assignor, by direct and mesne assignments, to Louisa Schlaikal, same place. Filed Jan. 11, 1888. Serial No. 260,168. (No model.)

Claim.—In a double-acting force-pump, the combination, with the inner cylinder A', provided with a piston, of a cylinder A², surrounding the cylinder A', passages *h h'*, formed between said cylinders, a divided valve-chamber B, applied to the lower ends of both cylinders and composed of a suction-valve chamber *b'*, connecting with the lower end of the inner cylinder and containing a suction-valve F, a suction-valve chamber *b²*, connecting with the passage *h* and containing a suction-valve F', and a check-valve chamber *b³*, interposed between the lower end of the inner cylinder and the passage *h'* and containing a check-valve *g³*, a head E, applied to the lower end of the chamber B and connecting with both chambers *b b'*, and a check-valve chamber

C, resting on the upper ends of both cylinders, communicating directly with the passage *h'* and communicating with the upper end of the cylinder by an opening *k*, provided with a check-valve *k'*, substantially as set forth.

411,262. FRONT FOR GRATES OR FIRE-PLACES. JAMES H. SETHUM, Cleveland, Ohio, assignor to the Seymour Stove Attachment Company, same place. Filed May 21, 1889. Serial No. 311,502. (No model.)



Claim.—1. As a new article of manufacture, a front for fire-places and grates, provided at each end with a wing of flexible material constructed to be bent into different positions in relation to the front, according to the different widths and forms of fire-places with which it is used, substantially as set forth.

2. A front for a fire-place or grate, made of rigid material, and flexible wings on said front to bear against the jamb, in combination with a grate and a catch to hold the front in position, substantially as set forth.

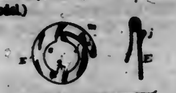
3. A front for a fire-place or grate, in combination with flexible wings attached to the ends of said front, substantially as set forth.

4. A front for fire-places or grates, consisting of a metal plate having wings at its ends and a detachable plate on said front along its top, substantially as set forth.

411,263. DOUBLE-ACTING PUMP. RALPH L. SHERMAN, Monmouth, Ill. Filed June 6, 1889. Serial No. 313,294. (No model.)

Claim.—1. In combination with the cylinder A, piston B, and its operating mechanism, the converging pipes G G', with valves *g g'* and stop-valves *g³ g⁴*, and the converging pipes E E', having valves *e²* and *e³* and stop-valves *e* and *e⁴*, substantially as and for the purpose specified.

2. In combination with the cylinder A and piston B, the converging pipes G G', united to form pipe G², and provided with valves *g g'*, and stop-valves *g³ g⁴*, and the converging pipes E E', having valves *e²* and *e³*, and stop-valves *e* and *e⁴*, and the faucets I, substantially as and for the purpose specified.



3. In combination with the cylinder A and piston B, the converging pipes G G', united to form pipe G², and provided with valves *g g'* and stop-valves *g³ g⁴*, and the converging pipes E E', having valves *e²* and *e³*, and stop-valves *e* and *e⁴*, and each of said pipes E E' G G' having a joint at the place where the ball-valve is located therein, substantially as and for the purpose specified.

411,264. PAD FOR INDELIBLE MARKING. JAMES R. SMITH, Waterbury, Conn., assignor to S. S. Stafford, New York, N. Y. Filed June 24, 1889. Serial No. 315,262. (No model.)

Claim.—A metal disk of substantially circular shape having a downwardly-projecting rim *a* around its edge, the said rim terminating in an outwardly-projecting flange *b*, forming a shoulder around the disk, combined with an elastic divided metal ring B, adapted to be set around the disk and yield to varying thicknesses of fabric which may be placed upon the disk, substantially as described.

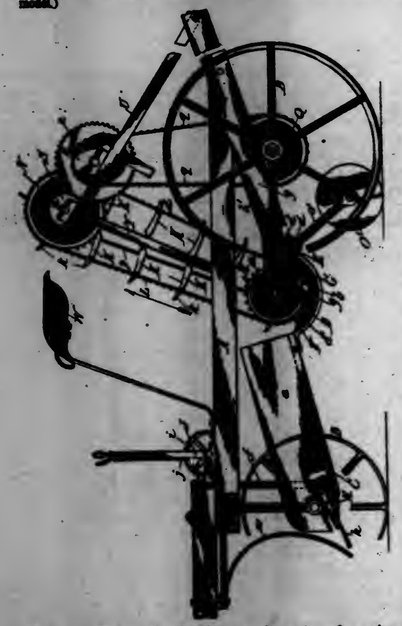
411,265. NUT-LOCK. ARTHUR SPEAR, Chicago, Ill., assignor of one-half to Thomas Kelly, same place. Filed June 28, 1888. Serial No. 278,100. (No model.)

Claim.—The combination, with bolt C, longitudinally grooved at its screw-threaded end, of washer-plate E, provided with nose *g* to engage the groove of the bolt, and being spirally slit from its outer edge to the bolt-hole or eye *e* to provide two helical tongues *j* and *i*, bent in opposite directions, the one *j* to provide an elastic shoulder between the fish-plate and the under side of nut D, and the other one *i* to form a spring-pawl engaging either corner of nut D, all substantially as set forth.

411,266. PIPE-WRENCH. CHARLES C. STANLEY, Boston, assignor to Charles F. Brown, Reading, Mass. Filed Apr. 11, 1889. Serial No. 306,808. (No model.)

Claim.—In a pipe-wrench, the combination of the shank *a*, the jaw *b*, having an inclined serrated face formed on the end of said shank and projecting from one side thereof, the yoke or loop *c*, formed on the opposite side of the shank from the jaw *b*, the ratchet-teeth *m*, formed on the shank between the sides from which the jaw *b* and

yoke *e* project, the slide *f*, adapted to move on the shank, the swinging jaw *c*, having a serrated face which is inclined oppositely to the face of the jaw *b* and formed on an arm *d*, the inner end of which is pivoted at *g* to said slide, the spring *p* between the shank *a* and arm *d*, and the dogs *j*, pivoted to said slide and extended beyond the same, and having the teeth *m'*, adapted to engage the teeth *m* on the shank, all arranged and operating substantially as set forth.



411,267. GONG-BELL. WILBUR F. SEARS, East Hampton, Conn., assignor to the Starr Bros. Bell Company, same place. Filed May 3, 1889. Serial No. 309,478. (No model.)

Claim.—1. In a gong-bell, the combination of the base A and the actuating-lever D, hung thereon and constructed with a toothed segment H, the hammer having its hub constructed with teeth *a b*, adapted to engage and escape from the teeth of the segment, the pivot upon which the hammer is hung constructed as a part of the arm, secured to the base distant from the pivot-point of the hammer, substantially as described.

2. In a gong-bell, the combination of the actuating-lever D, the hammer having its hub I constructed with teeth *a b*, the hammer hung upon a pivot on the base, and the ductile wire stop *f*, fixed to the base distant from the said hub, but extending into the path of the hub, substantially as and for the purpose described.

411,268. CORN-HARVESTER. SIDNEY M. STEVENS and GEORGE A. HARVEY, De Kalb, Ill. Filed Oct. 26, 1886. Serial No. 217,212. (No model.)

Claim.—1. The combination, in a corn-harvester, of a series of guiding-arms adapted to present the stalks to the picking mechanism, a series of combing picker-heads striking the ears from below and stripping the stalks by an upward raking motion, and a series of stalk-detainers located in the channels between the guiding-arms and so that the teeth of the picker-heads pass astride thereof, substantially as specified.

2. The combination, in a corn-harvester, of the traveling toothed picker-head striking the ears from below and stripping the stalks by an upward raking motion, with a stationary knife or detaining device for engaging the stalk below the ear, and located, essentially as shown, so the teeth of the heads pass astride thereof, substantially as specified.

3. The combination, in a corn-harvester, of a series of picker-heads striking the ears from below and stripping the stalks by an upward raking motion, and a series of stationary knives or stalk-detainers, located, essentially as shown, so the teeth of the heads pass astride and below the level thereof, substantially as specified.

4. The traveling picker-heads adapted to engage the ears from below and to strip the stalks by an upward raking motion, in combination with stationary knives or stalk-detainers inclined backwardly and downwardly, substantially as specified.

5. In a corn-harvester, the combination, with the picking mechanism, of a series of stalk-guiding arms C, the points whereof are provided with inclined flat-iron-like caps, the flanges of such caps extending to a plane above that of the arms C, whereby ears entering the spaces between the caps are guided to the top of the arms and above the channels *c* between them, substantially as specified.

6. In a corn-harvester, the elevator-chains and their carrying-wheels, in combination with picker-heads borne by said chains, said heads projecting inward from the plane of the chains, so that their interior edges meet as the chains pass around the lower elevator-wheels, substantially as and for the purpose set forth.

7. In a corn-harvester, a series of stalk-guiding arms, in combination with traveling picker-heads the teeth whereof are located at either side of the channels between said arms, the arms controlling the corn until it has entered within the line of motion of the heads, and the heads passing below the level of the arms, substantially as set forth.

8. In a corn-harvester, the cleaning-irons F, the knives, and the strap-irons extending from the latter to the former, in combination with the elevator and its picker-heads, substantially as specified.

9. The combination of the arms C, curved connections D, iron bolts *d*, side castings E, and shaft F, substantially as specified.

10. The combination of the arms C, curved connections D, iron bolts *d*, side castings E, shaft F, and journal-castings G, substantially as specified.

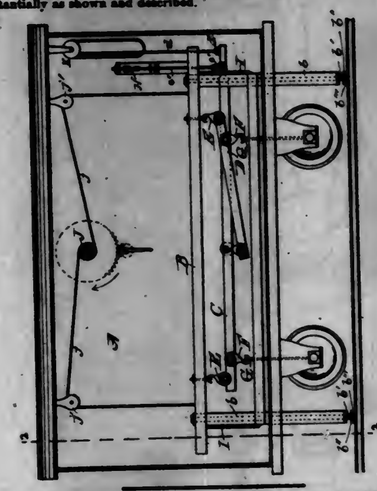
11. In a corn-harvester, an elevator carrying a series of moving picker-heads and adjustable to and from the ground, in combination with guide-arms C and their curved connections, also adjustable, and the knives in fixed position relative to the elevator-path, substantially as set forth.

12. In a corn-harvester, an ear-picking elevator consisting of side chains carrying picker-heads extending from chain to chain and passing around lower wheels supported upon stub-axles, and having driving-wheels at the top, said elevator being placed transversely of the harvester, so as to receive the growth directly in its front, in combination with actuating mechanism located at the side of the machine and gathering-arms conducting the corn to the front of the elevator, whereby contact between the growth and rotating parts of the machine is avoided, substantially as specified.

13. In a corn-harvester having supporting-wheels B B, a series of moving picker-heads striking the ears from below and stripping the stalks by an upward raking motion and receiving motion from the supporting-wheels, and a series of downwardly-acting stalk-detainers, the combination, with such pickers and stalk-detainers, of the roller O, loosely jointed to the harvester and located in the rear of the detainers, substantially as set forth.

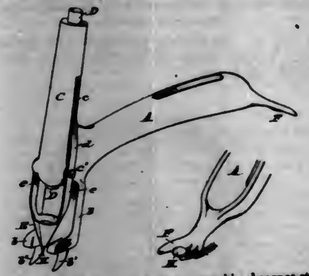
14. In a corn-harvester having supporting-wheels B B and a series of moving picker-heads striking the ears from below and stripping the stalks by an upward motion, said heads receiving motion from said supporting-wheels, the combination, with such picker-heads, of a roller O, loosely joined to the harvester, so it may ride over the unevenesses of the surface and engage the stalks near the ground, substantially as specified.

15. The combination, with the picker-heads having the slotted teeth, of the curved pieces D, having the ribs *d'*, substantially as specified.



16. In a corn-harvester, an ear-picking elevator consisting of picker-heads and the chains to which such heads are immovably attached at each end, the heads having teeth *h* and channels *h'* between the same, and the attachment thereof to the chains being located in a plane about midway between the inner and outer ends of said channels and as nearly as may be in the line of the strain, substantially as specified.

411,269. WEIGHING-CAR FOR TESTING RAILWAY-TRACK SCALES. THOMAS M. TAYLOR, Atlanta, Ga. Filed Apr. 22, 1889. Serial No. 308,126. (No model.)

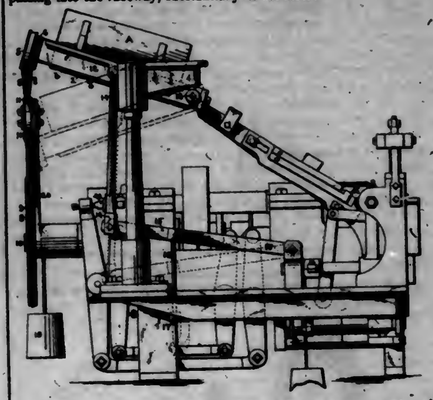


Claim.—1. As an improvement in cars for testing railway-scales, the car A, provided with hoisting devices such as described, and the frame B, having attached to it the weighing device, substantially as shown and described.

2. As an improvement in cars for testing railway-scales, the frame B, supports for said frame, consisting of the uprights *b*, provided with screws *b'*, fitting in steps *b''*, the removable rods I, for bracing said frame B, and the uprights *b*, substantially as shown and described.

3. As an improvement in cars for testing railway-scales, the frame B, levers C and D, suspended on said frame and attached to the axles of the car, as specified, the said lever C having on its outer end the sleeve *c*, carrying pivots for the loop *d'*, the loop *d'*, and the rod *d''*, connecting with the beam H, all combined, arranged, and operating substantially as shown and described.

411,270. COMBINED CARPET-STRETCHER AND TACK-DRIVER. SAMUEL L. TROUP, Philadelphia, Pa. Filed May 6, 1889. Serial No. 309,749. (No model.)



Claim.—As an article of manufacture, a combined carpet-stretcher and tack-driver, consisting, essentially, of a shank or body terminating in stretching-prongs, a lever or handle angularly projecting rearward from said body, a plunger-casing extending in advance of and above said shank or body, whereby a recess is constituted in the front face of the device, a plunger within said casing, a spring for maintaining the plunger elevated within the casing, conically-formed tack-holding jaws, and spring-arms the upper ends of which are attached to the casing and the lower ends to said jaws, whereby the latter are permanently held in proximity to the stretching-prongs, with the result that they are, by virtue of the above-mentioned recess, accessible from the exterior of the device, so that a tack may be placed directly therein, substantially as set forth.

411,271. MACHINE FOR DRESSING BOLTS OR BOLT-BLANKS. WILLIAM H. WARD, Port Chester, N. Y. Filed June 27, 1888. Serial No. 315,716. (No model.)

Claim.—1. The combination, with the raceway for conveying a series of headed blanks, of a hopper located at the top of said raceway for holding the blanks in mass and mechanism, substantially as described, located at the bottom of the hopper for engaging the lowermost blanks of the mass and causing them to arrange themselves in alignment with the raceway, and sustaining such arranged blanks by their heads preparatory to their passing into the raceway, substantially as set forth.

2. The combination, with the raceway for conveying a series of headed blanks, of a hopper located at the top of said raceway for holding the blanks in mass and a pair of rollers located at the bottom of the hopper for engaging the lowermost blanks of the mass and causing them to arrange themselves in alignment with the raceway, and sustaining such arranged blanks by their heads preparatory to their passing into the raceway, substantially as set forth.

3. The combination, with the raceway for conveying a series of headed blanks, of a hopper located at the top of the raceway for holding the blanks in mass and a pair of rollers or agitators at the bottom of the hopper, which are furnished with grooves or ribs for engaging the lowermost blanks of the mass and causing them to arrange themselves in alignment with the raceway, and sustaining such arranged blanks by their heads preparatory to their passing into the raceway, substantially as set forth.

4. The combination, with the raceway, of a hopper for holding the headed blanks in mass and a pair of rollers located at the bottom of the hopper and having grooves or ribs spirally arranged thereon, the said rollers being separated by a space sufficient to allow the shanks of the blanks to pass between them, substantially as and for the purposes specified.

5. The combination, with the raceway, of a hopper for holding the headed blanks in mass and a pair of rollers located at the bottom of the hopper and having grooves or ribs spirally arranged thereon, which grooves or ribs terminate short of the delivery ends of said rollers, so as to leave a smooth surface at said ends, the said rollers being separated by a space sufficient to allow the shanks of the blanks to pass between them, substantially as and for the purposes specified.

6. The combination, with the raceway for conveying a series of headed blanks, of a hopper located at the top of said raceway for holding the blanks in mass, mechanism, substantially as described, located at the bottom of the hopper for engaging the lowermost blanks of the mass and causing them to arrange themselves in alignment with the raceway and sustaining them by their heads preparatory to their passing into the raceway, and means for vibrating said hopper and blank-sustaining mechanism in a vertical plane, substantially as and for the purposes specified.

7. The combination, with the raceway, of a hopper for holding the blanks in mass, a frame to which the hopper is secured, a pair of rollers or agitators located at the bottom of the hopper and mounted to revolve in said frame and geared to each other, so as to rotate at different speeds, mechanism for vibrating the hopper and frame in a vertical plane, a belt for driving said rollers or agitators, and a take-up for the belt to keep it taut during the vibrating movements of the hopper, substantially as set forth.

8. A pair of gripping-jaws for holding the blanks to be operated upon, both of which jaws are pivoted, so as to be movable toward and from each other, combined with mechanism, substantially as described, for opening both jaws at the same time in directions opposite to each other, means for feeding blanks one by one to said jaws, and a tool for operating upon the blanks, substantially as set forth.

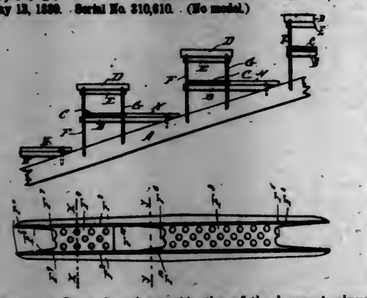
9. A pair of gripping-jaws for holding the blanks to be operated upon, both of which jaws are pivoted, so as to be movable toward and from each other, combined with mechanism, substantially as described, for opening and closing both jaws at the same time, means for feeding blanks one by one to said jaws, and a tool for operating upon the blanks, substantially as set forth.

10. The combination, with a pair of gripping-jaws for holding the blanks to be operated upon, both of which jaws are pivoted, so as to be movable toward and from each other, of mechanism, substantially

as described, for opening and closing both of said jaws, a safety-pin securing parts of said mechanism to each other, means for feeding blanks one by one to said jaws, and a tool for operating upon the blanks, substantially as set forth.

11. The combination, with a pair of gripping-jaws for holding the blanks to be operated upon, of a tool block and holder arranged, as described, to be moved toward and away from said jaws and an adjustable gage located on the forward end of the tool-holder to engage the top surface of the head of the blank in said jaws and push the blank toward the jaws, and thereby regulate the position of said head relative to the jaws, substantially as set forth.

12. The combination, with the tool-block holder, of the tool-block pivoted at a point between its ends to the holder and the sliding rod arranged, as described, to operate upon the tail end of the tool-block to bring the tool up to its work, whereby greater steadiness of the tool-holder and tool is secured, substantially as set forth.



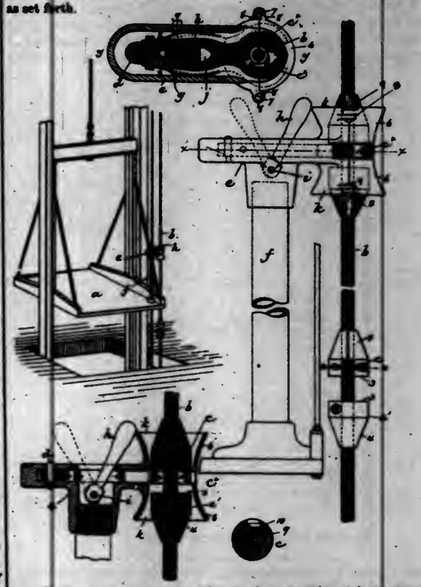
13. The combination, with a pair of jaws for gripping the blanks and holding them to be operated upon, both of which jaws are movable to and from each other, of a pair of stationary stripping-plates, one for each jaw, for clearing a blank from either jaw in case the blank sticks therein when the jaws are opened, substantially as set forth.

411,272. FASTENING ARTIFICIAL TEETH. GEORGE M. WHEELER, Philadelphia, Pa., assignor to Henry D. Justi, same place. Filed Apr. 29, 1889. Serial No. 308,970. (No model.)

Claim.—A fastening for a tooth, consisting of a piece of wire or other suitable material having its ends adapted to engage in a slot or recess in the back of the tooth, and a base-plate having some of its material in said slot closing on and embedding the fastening therein and some of the material closing on and embedding the portion of the fastening outside of said slot, the parts named being combined substantially as described.

411,273. STAGING. GEORGE W. ENGLISH, Philadelphia, Pa. Filed May 13, 1889. Serial No. 310,610. (No model.)

Claim.—1. In staging, the combination of the beams A, clamps F and G, strips B, blocks E, rests D, and steps C, constructed and arranged as set forth.



2. The clamps F and G, of unequal length, provided with converging ribs in the inner edges adapted to indent and hold upon timber, substantially as set forth.

3. The clamps F and G, provided with internal converging ridges and spurs or points F^8 and G^8, F^9 G^9, and F^7 G^7, F^{11} and G^{11}, constructed substantially as described, and for the purpose set forth.

411,274. ELEVATOR-LOCK. EDWIN R. ANGELL, Boston, Mass. Filed Jan. 14, 1889. Serial No. 296,948. (No model.)

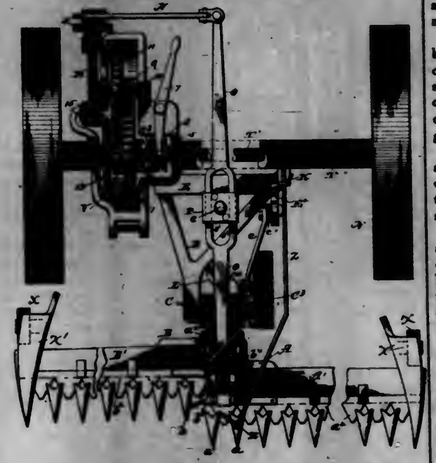
Claim.—1. An elevator-lock composed of a holder or casing, a pair of spring-closed separable jaws pivoted thereto, and a movable key or lever interposed between said jaws, the latter being recessed at their inner sides to receive the key or lever when the same is moved to one position and provided with cheeks or surfaces 2 2, arranged to be displaced by the key or lever when it is moved to another position, as set forth.

2. The combination of the holder or casing provided with means for attachment to an elevator and provided with a rope guide or guides, the spring-closed jaws pivoted to said holder and having their free ends arranged to engage a collar on the shipping-rope, and the pivoted lever interposed between the jaws, the latter having cheeks or surfaces 2 2, arranged to be displaced by a movement of the lever, as set forth.

3. The jaw holder or casing having the rope-guides *k k*, composed of two sections, one of which is formed on the casing and the other detachably connected and adapted to be displaced, as set forth.

411,275. DEVICE FOR ADJUSTING AND SECURING CAMS. HARRY S. HAFTA, Kansas City, Mo. Filed Feb. 9, 1889. Serial No. 299,233. (No model.)

Claim.—1. The combination of an adjustable cam fitted on a shaft, a rotary disk, and a lever connected to said cam and adjustably secured to the disk, substantially as and for the purpose described.



2. The combination of a shaft, an adjustable cam fitted loosely thereon, a rotary disk fixed on the shaft to rotate therewith, and a lever fulcrumed on the disk and pivotally connected to the cam, substantially as and for the purpose described.

3. The combination, with a shaft and an adjustable cam fitted thereon, of a rotary disk fixed to the shaft and having a segmental slot, and a lever arranged laterally of and fulcrumed on said disk and having a connecting-pin which passes through the slot of the disk, substantially as described.

4. The combination, with a shaft and a cam fitted loosely thereon, of a rotary disk fixed to the shaft to rotate therewith, a lever fulcrumed on the disk and connected to the cam, and mechanism for detachably holding said lever on the disk against movement thereon, substantially as and for the purpose described.

5. The combination, with a shaft and a cam fitted loosely thereon, of a rotary disk fixed on the shaft and having a series of apertures, and a lever fulcrumed on the disk and connected to the cam, said lever having a locking-pin adapted to be forced into one of the series of apertures in the disk to confine the lever against movement on its fulcrum, substantially as described.

411,276. MOWING-MACHINE. CHARLES M. BROWN, Chicago, Ill. Filed Feb. 20, 1889. Serial No. 300,565. (No model.)

Claim.—1. In a mowing-machine, the combination, with a push-bar, of a coupling-piece loosely connected thereto, two finger-bars pivoted to the coupling-piece in the same horizontal plane and slightly overlapping at their inner ends, knife-bars, and mechanism for reciprocating the latter, whereby one continuous swath can be cut by the two finger-bars and their knife-bars, substantially as set forth.

2. In a mowing-machine, the combination, with a push-bar, of a coupling-piece pivotally connected thereto, a pair of finger-bars pivoted to said coupling-piece in line with the center of the axle, the pivotal connection of both finger-bars being in the same horizontal plane, knife-bars, and mechanism for reciprocating the latter, substantially as set forth.

3. In a mowing-machine, the combination, with a pivoted push-bar and a coupling-piece pivotally connected therewith and adapted to move in a vertical plane, of finger-bars carried by the coupling-piece, knife-bars, a longitudinally-adjustable lever pivotally connected to the knife-bars, and mechanism for vibrating the lever.

4. In a mowing-machine, the combination, with a pair of finger-bars pivoted on the same axis and a device for locking said bars in a depressed condition, of knife-bars, a pivoted lever connected with said bars, and mechanism for vibrating the lever, substantially as set forth.

5. In a mowing-machine, the combination, with a pair of finger-bars, of knife-bars, a longitudinally-adjustable lever pivotally connected with said knife-bars, mechanism for vibrating the lever, and means for raising and tilting the finger-bars, substantially as set forth.

6. In a mowing-machine, the combination, with a main frame, a push-bar pivoted thereto, and a lever for raising and lowering the push-bar, a coupling-piece pivotally supported on the forward end of the push-bar, a supporting-wheel adjustably connected with said coupling-piece, and a lever connected with the coupling-piece for tilting the latter, substantially as set forth.

7. In a mowing-machine, the combination, with a main frame and a push-bar pivoted thereto, of a coupling-piece pivotally supported on the push-bar, a lever also pivoted on the push-bar within a slot on the coupling-piece, said lever having one end beneath the coupling-piece and the other end projecting backward, a pivoted hand-lever, and a flexible connection uniting the hand-lever with the first-mentioned lever, substantially as set forth.

8. In a mowing-machine, the combination, with a main frame, a push-bar pivoted thereto, and a coupling-piece pivotally supported on the push-bar, said coupling-piece having a projection thereon, of a pair of finger-bars pivoted on this projection, and a catch pivotally supported in the projection for locking the finger-bars, substantially as set forth.

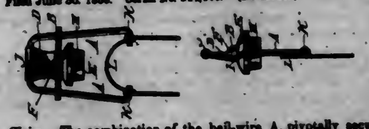
9. In a mowing-machine, the combination, with a main frame, a push-bar pivoted thereto, and a coupling-piece pivotally supported on the push-bar, said coupling-piece having a projection thereon, of finger-bars supported on said projection, knife-bar, a vibrating lever for operating the latter, and a pronged catch pivoted in the projection adapted to lock the finger-bars when down and to straddle the vibrating lever when raised, substantially as set forth.

10. In a mowing-machine, the combination, with a main frame and a push-bar pivoted thereto, of a coupling-piece having a projection thereon, a pair of finger-bars pivoted on said projection, one in advance of the other in the same horizontal plane, knife-bars, and mechanism for operating said knife-bars, substantially as set forth.

11. In a mowing-machine, the combination, with a pair of shoes having projecting fingers thereon, one of said shoes located behind the other and having a projection back of one of the fingers on the front shoe, finger-bars secured to the shoes, track-clearers on the outer ends of the finger-bars, and rollers adjustably mounted upon said track-clearers, of knife-bars and gearing for operating said knife-bars together, substantially as set forth.

12. In a mowing-machine, the combination, with the main frame, a push-bar pivoted thereto, and finger-bars connected with the latter, of knife-bars and a vibrating lever having a swivel-connection with the knife-bars and a sliding pivotal connection with the push-bar, substantially as set forth.

13. In a mowing-machine, the combination, with the main frame, a push-bar pivoted thereto, and finger-bars connected with the latter, of knife-bars, a vibrating lever having a swivel-connection with the knife-bars and a sliding pivotal connection with the push-bar, a pitman connected with the opposite end of the lever, a driving-shaft for operating the pitman, and gearing for driving the shaft, substantially as set forth.



14. In a mowing-machine, the combination, with a pivoted push-bar and a coupling-piece pivotally connected therewith and adapted to move in a vertical plane, of finger-bars carried by said coupling-piece, knife-bars, a lever connected at one end with the knife-bars and having a sliding pivotal connection between its ends, with the push-bar, gearing for transmitting motion from the axle to the lever, and a clutch for throwing the machine into and out of gear, substantially as set forth.

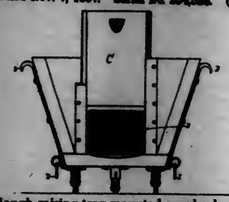
15. In a mowing-machine, the combination, with a pair of finger-bars and a pair of knife-bars, of a lever for operating both knife-bars, said lever having ball-joints projecting from its end, one for each knife-bar, and sectional boxes on said ball-joints to connect the knife-bars to said lever, one of said boxes having flanges and set-screws for securing it to the knife-bars, substantially as set forth.

16. In a mowing-machine, the combination, with a pole, frame, and push-bar pivoted to the latter, of finger-bars connected with the push-bar, a rod extending loosely from one of the finger-bars through the pole, and guard-arms loosely mounted on the rod and having connection with the push-bar, substantially as set forth.

17. In a mowing-machine, the combination, with the finger-bars, knife-bars, driving mechanism, and a lever connected at one end to the knife-bars, of a pitman connecting said lever with the driving mechanism and having a wedge-shaped slot at one end carrying a journal-box for the wrist-pin of the driving mechanism, and means for yieldingly forcing the sections of the box into the smaller end of the slot, substantially as set forth.

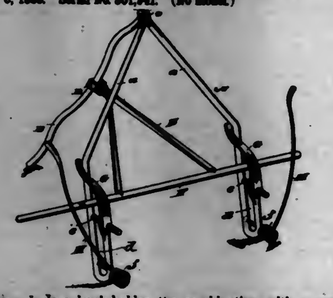
411,277. BOTTLE-STOPPER. THOMAS J. CAIN, Cleveland, Ohio. Filed June 30, 1888. Serial No. 314,176. (No model.)

Claim.—The combination of the bail-wire A, pivotally secured to the neck of the bottle, the pressure-link D, pivotally secured to the bail-wire, the stop-rod B, secured to the pressure-link and extended to engage the arms of the bail-wire, the latter being offset with respect to the stop-rod, and the stopper for closing the mouth of the bottle, secured to the pressure-link, substantially as and for the purpose set forth.



411,278. RAIL-BLANK PLATE. NELSON CRANE, Haverhill, Mass. Filed Jan. 11, 1889. Serial No. 296,054. (No model.)

Claim.—1. A nail-blank plate having an undulating surface on each side to form the body of the nail and upset on each of its edges to form the heads and points of the nails, substantially as set forth.



2. A nail-blank plate having an upset edge on each side to form the head and point of a round nail, the space between said edges being of undulating form, so that when each section is separated therefrom it will form a complete round nail, substantially as set forth.

411,279. DOUGH-RAISING TRAY. ISABELLE E. DANFORTH, Cleveland, Ohio. Filed Nov. 7, 1887. Serial No. 254,669. (No model.)

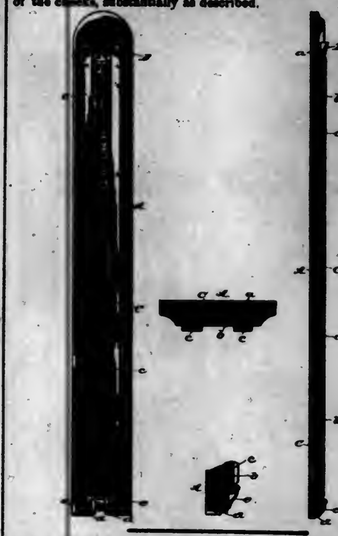
Claim.—A dough-raising tray mounted on wheels, having a doorway or opening of large size, suitable for discharging the sponge from the tray, a slide or gate for closing such opening, suitable apparatus, preferably hooks and rings, as shown, for attaching hoisting mechanism, the parts being arranged substantially as set forth.

411,280. MUSIC-HOLDER. OREN S. DOUSELL, Franklin, Me. Filed Mar. 5, 1889. Serial No. 301,941. (No model.)

Claim.—1. In a book-holder, the combination, with a supporting-frame, of laterally hinged or pivoted yielding arms adapted to engage the covers of a book, and hinged or pivoted yielding arms adapted to engage the leaves of a book, substantially as specified.

2. In a book-holder, the combination, with a supporting-frame, of the yielding cover-holders secured thereto and movable laterally thereon, the bearings for the lower edges of the cover serving the additional function of pivot-bolts for the cover-holders, and the pivoted spring-arms adapted to press upon the leaves and hold the same against the cover, substantially as specified.

3. The combination, in a book-holder, of a supporting-frame, the curved brace-bar pivoted thereto, and a pivoted or hinged arm carrying at its outer end a hinged slide-loop, which receives the said curved bar and connects the same with the frame, substantially as specified.



4. The combination, with a supporting-frame, of the hinged brace-bar, the arm carrying a slide-loop and receiving the said brace-bar and having its opposite end connected with the cross-bar of the main frame, and the cross-bar having hinged extensions, substantially as specified.

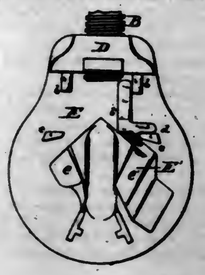
5. The combination, with the main frame having its branches bent into looped legs, of the bearing *a* at the upper end of the loops, the spring-arms G, and the spring-wire leaf-holders H, also connected with the legs and adapted to have a play thereon, substantially as specified.

411,281. INDICATOR FOR BARBERS' SHOPS. BEVERLEY R. DUDLEY and ARCHIBALD R. CURRY, Richmond, Va. Filed June 12, 1889. Serial No. 314,002. (No model.)

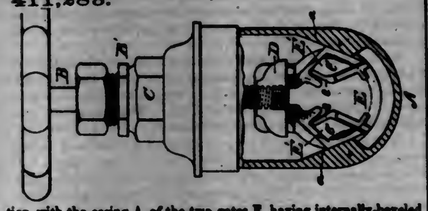
Claim.—1. An indicator for barbers' shops, consisting of a straight piece of material having a longitudinal channel with a glass front plate and retaining side strips, grooves, or seats for the same, in combination with a series of numbered checks, a hopper-shaped mouth-plate at the top, and retaining devices for the checks at the bottom, substantially as shown and described.

2. In an indicator, the combination, with the channeled case and transparent front plate, of a series of numbered checks, stops at the lower end of the channel for sustaining the column of checks, and a spring or springs for permitting the lateral deflection and withdrawal of the checks, substantially as described.

411,282. CORN-PLANTER. GEORGE H. EVANS, Jr., Independence, Kans. Filed May 21, 1889. Serial No. 311,587. (No model.)



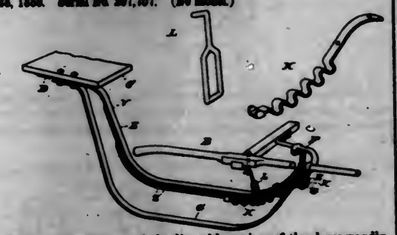
Claim.—1. The combination of the frame and hoppers, the seed-slide provided with seed-apertures and adapted to work under said hoppers, a slotted plate O, secured upon the seed-slide, a sliding flanged block N, secured to the seed-slide by means of the said plate O, this block N being shorter than the slot in which it works, a rod connected to this block N, and means for operating this rod, substantially as described.



2. The combination of a frame and seed-hoppers, a seed-slide, a hopper F, yoke G, working under this hopper and secured to seed-slide and apertured, as described, the projections *f* upon this yoke, a pivoted plate *e*, the upper end of which works between the projections *f*, and a tube H, inclosing the said pivoted plate, as and for the purposes described.

411,283. VALVE. JAMES GALVIN, Detroit, Mich. Filed Mar. 6, 1889. Serial No. 302,106. (No model.)

Claim.—1. In a valve of the character described, the combina-



411,283.

tion, with the casing A, of the two gates E, having internally-beveled surfaces provided with inclined lugs *c c*, lugs *c c* and *b b*, arranged as specified, and the wedges F F, having inclined surfaces *d' d'*, lugs *b'* and *d*, the inclined planes *a a* on the case A, the threaded nut D, engaging with said gates, and the operating-screw B, all as specified.

2. The combination, with the valve-casing constructed with inclined bearings *a a*, and provided with a cap, a screw-stem, and annular valve-seats, of two vertically and laterally movable gates E E, having inclined lugs *c c*, horizontal lugs *c c* above the latter, and lugs *b b* in a plane above the lugs *c c*, the wedges F F, having inclined surfaces, the supporting-lip *d'*, and lug *b*, and the nut D, engaging with the upper part of the said gates, all as specified.

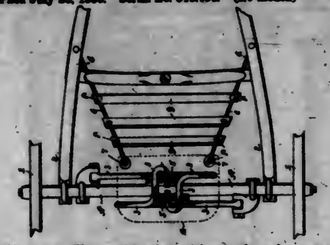
411,284. ROAD-CART. JOSHUA G. GAY, Ottawa, Ill. Filed Jan. 23, 1889. Serial No. 297,767. (No model.)

Claim.—1. The suspended adjustable spring of the downwardly-curved form described, having the rear horizontal portions serving as a seat bearing or support, and the foot-rest or bottom connected to said spring, the forward ends of said springs being curved upward and rearward for connection to the shackle-braces, substantially as specified.

2. The suspended adjustable spring of the downwardly-curved form described, having the rear horizontal extension serving as the seat-bearing, and the dropped leaf connected to said spring and bearing the foot-support, the forward ends of said springs being curved upward and rearward for connection to the shackle-braces, substantially as specified.

3. The adjustable suspended spring of downwardly-curved form, having a ratchet underlying its forward portion and attached to the same by means of an eyebolt, in combination with a swinging link embracing said spring and attached to a pivotal connection with the cross-bar or shaft, substantially as specified.

4. The combination of the bent seat-supporting spring composed of one or more leaves with a foot-rest or bottom attached to said spring, and having a ratchet attached to the forward end by an eye-bolt, and the pivoted link embracing said spring and engaging the ratchet, substantially as specified.



5. The combination, with the bent seat-supporting spring, its dropped leaf, and the foot-rest connected thereto, of the ratchet connected to an eyebolt, and an adjustable swinging link connected to the cross-bar or shafts and engaging said ratchet, substantially as specified.

411,285. POST-HOLE DIGGER. WILLIAM D. A. GRAY and JOHN D. KLEPPER, Limestone, Tenn. Filed June 14, 1889. Serial No. 314,288. (No model.)

Claim.—The herein-described improved post-hole digger, consisting of the receptacle of inverted-cup shape having a lower bevel edge, the hollow tube having upper and lower openings *b b'*, the follower moving in said receptacle, the spring located in said upper opening *b* and engaging said rod, and the foot-rest projecting from said rod through said lower opening, as set forth.

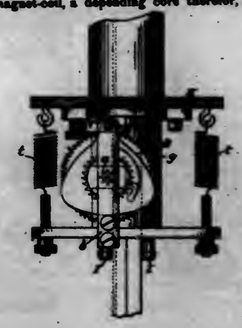
411,286. VEHICLE-SPRING. BOWIN JARMAN, Harper, Kans. Filed July 20, 1889. Serial No. 318,130. (No model.)

Claim.—1. The combination, with an axle and a seat or body, of a spring connecting the seat or body with the axle, said spring being bent into oval or elliptical form underneath the seat or body and having its ends bent in opposite direction and made to straddle the axle, one end being secured to the rear of the axle and the other to the front, substantially as set forth.

2. The combination, with an axle and a seat or body, of a spring consisting of two similar sections having enlarged bearings for the seat or body, the said sections, when together, bent into oval or elliptical form and their outer ends extended outward in opposite directions and connected with the opposite sides of the axle, substantially as set forth.

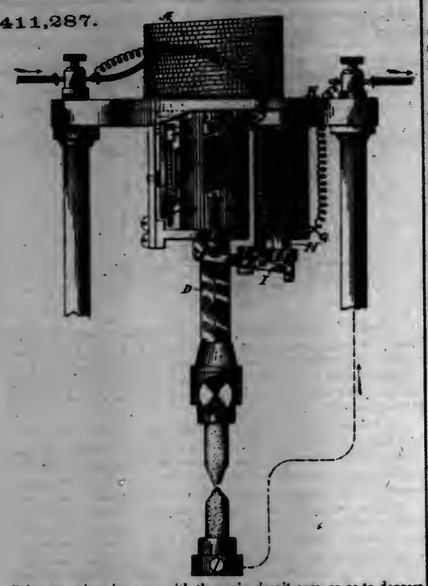
3. The combination, with an axle and seat or body, of a spring having a substantially S-shaped formation in its center, to which the seat or body is adjustably secured, and bent into oval or elliptical form at right angles to the S-shaped portion immediately below the latter, and having its ends extended outward in opposite directions and connected with the axle, substantially as set forth.

4. The combination, with an axle and seat or body, of a spring bent into oval or elliptical form beneath the seat or body and extending downwardly below the axle, front supports secured to the seat or body, and bottom slats secured to said plates, substantially as set forth.



5. The combination, with an axle and a seat or body, of a spring to which the seat or body is secured, said spring being bent into oval or elliptical form beneath the seat or body, with its ends extending outwardly in opposite directions and connected to the axle, and front springs connected to the seat and to the shafts or pole, substantially as set forth.

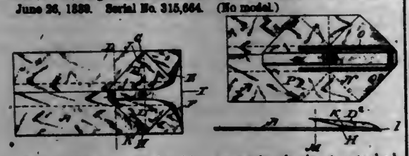
6. The combination, with an axle and seat or body, of a main axle-spring and a pair of front springs having eyes formed therein by bends in the springs, and slats secured to said springs, substantially as set forth.



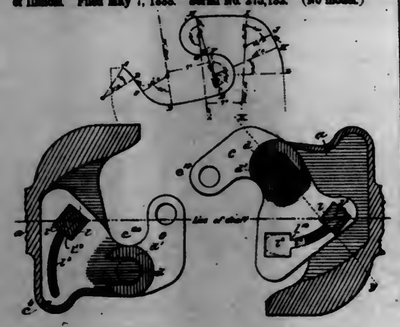
7. The combination, with an axle and seat, of a main axle-spring straddling the axle and connected thereto at its ends and a pair of front springs connecting the forward end of the seat, said front springs having eyes bent therein, and slats held to the springs by bolts extending through them into the eyes, substantially as set forth.

411,287. ELECTRIC-ARC LAMP. FRANK B. KEESHAN, New York, N. Y. Filed July 20, 1889. Serial No. 318,122. (No model.)

Claim.—The combination, substantially as described, of a main-circuit coil, a depending movable core therefor, a carbon-holder passing axially through such core, a carbon-lifting and feed-controlling mechanism sustained by the core and engaging with the carbon-carrier, a derived-circuit magnet-coil, a depending core therefor, and a pivoted



411,287.



lick connecting the same with the main-circuit core, so as to depress the same for the purpose of releasing the feed mechanism when the derived-circuit magnet-core is raised by its coil.

411,288. MAKING PAPER BAGS. WILLIAM A. LORENZ, Hartford, Conn., assignor of one-half to Edward R. Claasson, same place. Filed June 26, 1888. Serial No. 315,664. (No model.)

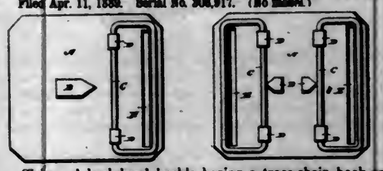
Claim.—That process of making a paper bag having two tucked-in sides and a flat rectangular bottom, which consists in first folding one end of the upper ply of the tucked-paper tube backward on the lateral line B C, and thus producing the folds D, D', and D², and in then carrying those folds, together with the adjacent part of the upper ply of the tucked-paper tube, backward around the lateral line L M as a center, and thus producing the diamond form of Figs. 8 and 9, and then in folding the truncated ends of that diamond form toward each other and down upon the center of the thus completed rectangular bottom of the bag, all substantially as described.

411,289. CAR-COUPLING. MADISON J. LORRAINE, St. Louis, Mo., assignor, by mesne assignments, to the Keystone Car Coupler Company, of Illinois. Filed May 7, 1888. Serial No. 273,122. (No model.)

Claim.—1. A car-coupling member of the type described, the contour of whose outer end consists of the composed curves I H G and D E F, united by the tangent G F, substantially as and for the purposes described.

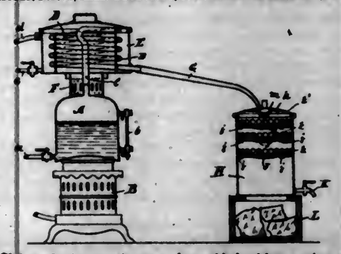
2. A car-coupling member of the type described, the nose c^{29} of which and the recess c^{30}, into which the nose of the opposing car-coupling member fits when coupled, are formed with the curves G H and E F, united by the tangent G F, slightly inclined toward the outer face H I, substantially as shown and described.

3. The combination, in a car-coupling, of a draw-head having bearings d d, the coupling-head having integrally-cast collars d' d' and curved slot f^3, and a shouldered locking-pin with a reduced stem engaging said slot and resting on inner arm of the coupling-head when open and dropping to lock it when closed.



4. The combination, in a car-coupling, of a draw-head, a pivoted coupling-head having a curved slot f^3, and a shouldered locking-pin with a reduced stem engaging with said slot and resting on the inner arm of the coupling-head when open and dropping to lock it when closed, substantially as set forth.

411,290. RACEWAY FOR ROTARY SEWING-MACHINE SHUTTLES. DANIEL R. MARSH, Bridgeport, Conn. Filed July 26, 1888. Serial No. 281,270. (No model.)

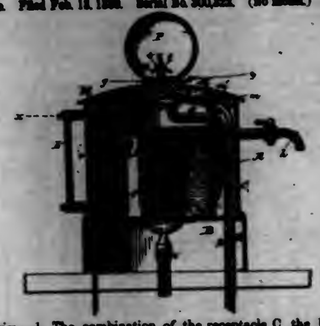


Claim.—A raceway for rotary shuttles, consisting of an independent and separable ring secured to the shuttle-race casing by dowel-connections, and a superimposed cap, the parts being combined as set forth.

411,291. BACK-BAND BUCKLE. WILLIAM A. MARSH, Foster, La. Filed Apr. 11, 1889. Serial No. 306,917. (No model.)

Claim.—A back-band buckle having a trace-chain hook on its outer side and a transverse slot, in combination with a loop locking-lever hinged to the said buckle at one side of the slot and adapted to turn over the slot without entering it, substantially as specified.

411,292. APPARATUS FOR PURIFYING WATER. FREDERIC H. MOORE, Boston, Mass. Filed Jan. 2, 1889. Serial No. 295,941. (No model.)



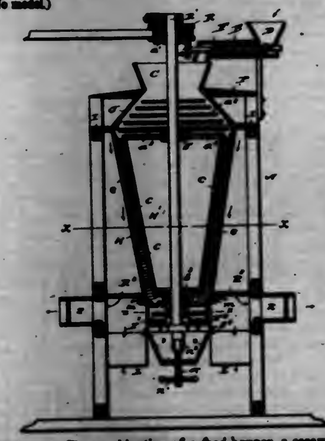
Claim.—1. An aerating-vessel provided with a series of dish-shaped perforated shelves at its upper end, and a series of holes through the wall of the vessel just above the level of each of the shelves for the admission of atmospheric air jointly with a water-distilling apparatus, and a pipe connecting the distilling apparatus and the upper end of the aerating-vessel, substantially as and for the purposes set forth.

2. In a water-distilling apparatus, a boiler, a worm or coil communicating therewith and inclosed within a condensing-vessel supplied with cold water jointly with an aerating-vessel provided with a series of perforated dish-shaped shelves and holes for the admission of atmospheric air, and a strainer on the under side of the cover, and a pipe

connecting the cover with the worm for conducting the condensed water thereto, substantially as shown and described.

3. In a water-distilling apparatus, a boiler, a worm or coil communicating therewith and inclosed within a condensing-vessel supplied with cold water jointly with an aerating-vessel having a series of dish-shaped perforated shelves at its upper end and a series of holes through the wall of the vessel just above the level of each of the shelves for the admission of atmospheric air, an ice-box, and a pipe connecting the coil with said aerating-vessel, substantially as and for the purposes set forth.

411,293. HOT-SODA APPARATUS. CARLOS C. HOSMAN, Olean, N.Y., assignor of one-half to James V. D. Coon and Melville C. Pollett, same place. Filed Feb. 13, 1889. Serial No. 300,222. (No model.)

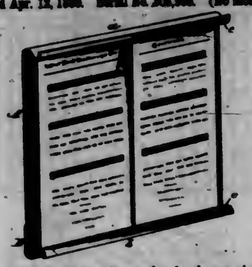


Claim.—1. The combination of the receptacle C, the boiler D within and the compartments I between them, and the tank E and coil G with the pipe H within the boiler, the pipe H leading out of the boiler and receptacle, and with the pipe F, leading into tank, as set forth.

2. The combination of the receptacle and its inclosed boiler, the cover, and the globe supported thereby and communicating with the steam-space of the boiler with the water-pipe leading into the globe and a waste-pipe terminating below a hole in the bottom of said globe, as set forth.

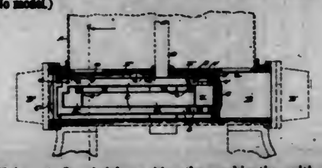
3. The combination of the receptacle C, the boiler D, the cover M, having the neck N, opening n, and hole n^2, and the globe P, communicating with the steam-space of the boiler, with the pipes R and S, the former passing through the opening n into the globe and the latter terminating below the hole n^2, as set forth.

4. The pipe R, having the jet-nozzle r, and the plate T, having the holes t, in combination with the globe and the cover, the latter having an opening below said holes, the boiler, and coil within it, as set forth.



411,294. MACHINE FOR DELINTING COTTON-SEED. JOHN H. MCCORMICK, New Orleans, La. Filed Apr. 5, 1889. Serial No. 306,130. (No model.)

Claim.—1. The combination of a feed-hopper, a screw-feeder in a delivering-trough, a receiving-hopper, a spreading-cone having radial rotative arms inside of it, the perforated internally-serrated cone, and a rotative brush-cone, substantially as specified.



2. The combination, in a cotton-seed-delinting machine, of a feeding device, a receiving-cone, centrifugal distributing-arms arranged in a spreading-cone, a perforated and interiorly-serrated delinting-cone, an interior rotative brush-cone, a fan fixed to the shaft of the latter, a separating-screen surrounding the fan, and an adjustable stop for said shaft, all constructed and adapted to operate substantially in the manner and for the purposes described.

411,295. MUSIC-BOOK HOLDER. WILLIAM D. NEWMAN, Paxton, Ill. Filed Apr. 13, 1889. Serial No. 308,006. (No model.)

Claim.—A holder for music or other books, consisting of two sections A B, having backs for support of the backs of the book and adjustably connected together, and having curved flanges a b, respectively, said sections forming supports for the entire book when in use, substantially as and for the purpose set forth.

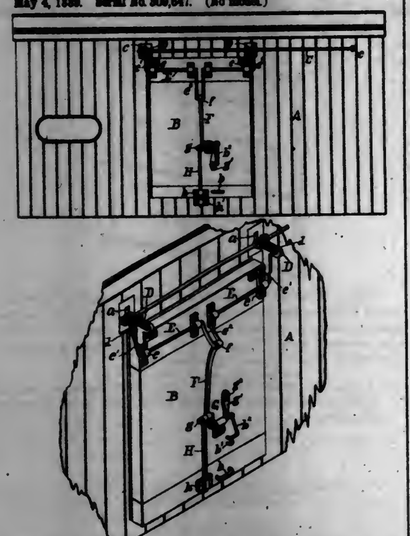
411,296. BRICK-MACHINE. JAMES W. PENFIELD and RAYMOND C. PENFIELD, Willoughby, Ohio. Filed Nov. 17, 1888. Serial No. 291,170. (No model.)

Claim.—1. In a brick-machine, the combination, with a horizontally-reciprocating plunger having end plate and top plate, the latter having vertical adjustment, of tongue-and-groove connection between such plates, whereby the adjustment of the top plate does not break the tongue-and-groove connection between the two plates, substantially as set forth.

2. The combination, with a pug-mill having a discharge-opening therein, of plate E and cut-off plate F, the latter being set in flush with the top surface of the former, plate E having undercut edges and plate F having correspondingly-beveled edges for mutual engagement, forming substantially a sliding dovetail, substantially as set forth.

411,297. COTTON-SCRAPER. JOSEPH L. PEYTE and JOHN Y. JAMES, Holly Grove, Ark. Filed June 22, 1889. Serial No. 315,192. (No model.)

Claim.—1. The combination, with the tongue, the bars B, and the handles pivoted thereon, of the scraper-arms pivotally connected with the tongue, and the arms connecting said scraper-arms with the handles, substantially as and for the purpose specified.



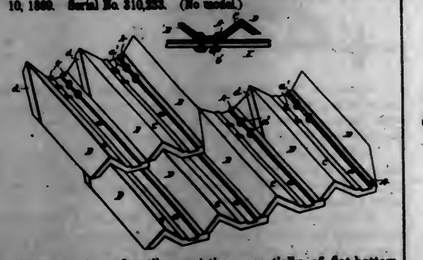
2. The combination, with the tongue, the shafts c thereon, the scraper-arms pivotally connected at one end to said shafts, and the pivoted handles, of the arms connecting the handles with the scraper-arms, substantially as shown and described.

3. The combination, with the tongue, the bars B, the plates H, the shafts c, journaled in said plates, the scraper-arms pivotally connected with said shafts, the clips K, and the handles pivoted on the bars B, of the arms M, connecting the handles with the arms carrying the scrapers, substantially as described.

4. The combination, with the tongue, the bars B, the handles

pivoted thereon, the plates H on the tongue, the shafts *o*, journaled in the extended ends of said plates, the clips K, the boxes L, and the bars I, carrying the scrapers and loosely sleeved on the shafts *o* at one end and attached to the clips and boxes between their ends, of the arms M, attached at one end between the boxes and arms I and at the other connected with the handles, substantially as and for the purpose specified.

411,298. CAR-DOOR. EDWARD L. PHIPPS, Milford, Mich., assignor of two-thirds to Solon H. Wilhelm and Alonzo D. Webb, same place. Filed May 4, 1889. Serial No. 309,647. (No model.)



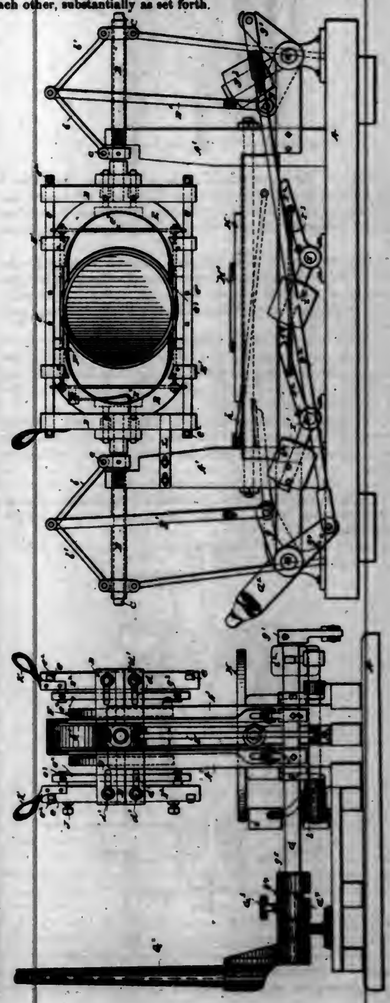
Claim.—1. The combination, with the car-frame and car-door, of a supporting-rod extending along the frame above the door, hangers attached to the upper edge of the door having elongated slots through which the rod is passed, whereby the upper edge of the door may be thrown toward or from the car-frame, and suitable mechanism for throwing the upper edge of the door either toward or from the car-frame, substantially as described.

2. The combination, with the car-frame having a supporting-rod located above the door and the car-door provided with hangers having elongated slots which embrace the supporting-rod, of the lever E, shaped substantially as shown and pivoted to the door, whereby when the portion e^4 of the lever E is thrown upward the door is thrown out from the frame, and vice versa, substantially as described.

3. The combination, with a car-frame and a car-door, of a supporting-rod C, slotted hangers D, lever E, connected with the rod, a rod F, extending from the lever, the rotating lever G, having a handle *g'*, and a crank *g*, connected to the rod extending from the lever, a rod H, connected to said crank, and a clip *k'*, substantially as described.

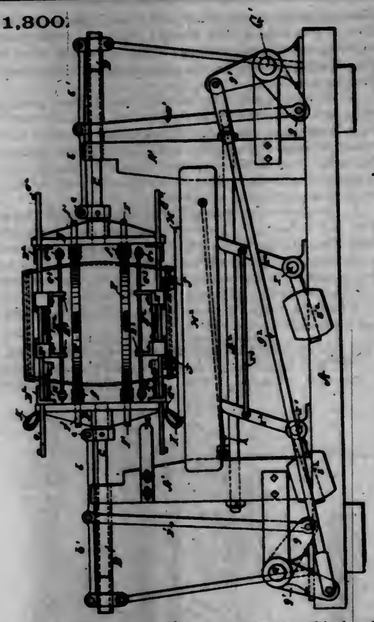
411,299. ROOFING-TILE. JOSEPH RAPP, Akron, Ohio. Filed May 10, 1889. Serial No. 310,233. (No model.)

Claim.—1. A roofing-tile consisting, essentially, of flat-bottom trough with sloping sides and inverted trough, the troughs having a side in common, the inverted trough being adapted to fit over the opposing side of the next adjacent tile, the diagonally-opposite corners of the tile being beveled, substantially as and for the purpose set forth.



2. A roofing-tile consisting, essentially, of a flat-bottom trough and inverted-V-shaped trough having a side in common, substantially as indicated, the flat-bottom trough having recess *a* and holes through the bottom wall of such recess for the purpose of securing the tile, substantially as set forth.

3. The combination of a roofing-tile, shaped substantially as indicated, having recess *a* and holes *a'*, and securing-wires for fastening the tiles, substantially as and for the purpose set forth.



411,300. BARREL-MAKING MACHINE. LEMUEL M. RAMP, Cleveland, Ohio. Filed Apr. 26, 1889. Serial No. 308,648. (No model.)

Claim.—1. In a barrel-making machine, the combination, with clamping-frames adapted to revolve on their axes, of toggle-joints for operating the clamping-jaws of such frames, and a hand-lever for operating the toggles, the different members being operatively connected, substantially as and for the purpose set forth.

2. In a barrel-making machine, the combination, with reciprocating clamping-jaws, of a former consisting of opposing springs yieldingly connected with the jaws, and mechanism connected with said jaws for reciprocating them simultaneously toward and away from each other, substantially as set forth.

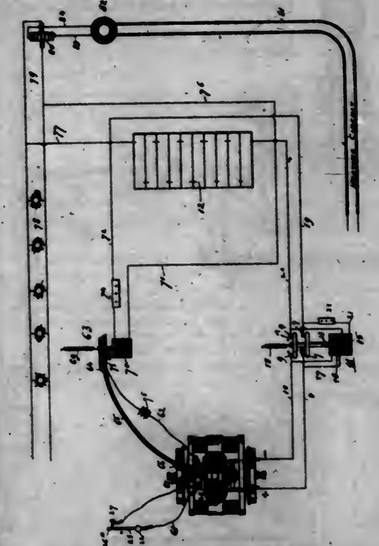
411,300.

3. In a barrel-making machine, the combination, with clamping-jaws, substantially as indicated, of a former consisting of opposing springs adapted to expand in shaping the barrel, such springs being yieldingly connected with the clamping mechanism, substantially as set forth.

4. In a barrel-making machine, the combination, with clamping-jaws and elastic former, substantially as indicated, of rigid frames loosely supported from the clamping mechanism, such frames having cross-bars adapted to engage such supports, whereby the frames in opening the clamp are brought in central position with the cross-bars inside the line of the clamping-jaws and former, substantially as set forth.

411,301. SYSTEM OF ELECTRIC GENERATION AND DISTRIBUTION FOR RAILWAY-CARS. ELIAS R. REES, Baltimore, Md., assignor to Rees & Henderson, same place. Filed Apr. 11, 1888. Serial No. 270,947. (No model.)

Claim.—1. The combination, with a dynamo-electric generator mounted upon a traveling vehicle and having its armature mechanically connected with an axle of said vehicle, of a double set of commutator-brushes for said dynamo, a system of levers controlling the movement of both sets of brushes and operated by the direction of travel of the vehicle, pivoted contacts controlled by said system of levers, a vertically-pivoted circuit-controlling weighted lever arranged to engage one of said contacts and controlled by gravity, and the field-magnet circuit of said dynamo, including said gravity-lever and its contact.



2. The combination, with a dynamo-electric generator having its armature mounted upon the axle of a traveling vehicle, of a speed-governor mounted upon and controlled by said axle, and the field-magnet circuit of said dynamo controlled by said speed-governor.

3. The combination, with a dynamo-electric generator having independent field-coils and operated by the momentum of the train, of a secondary battery in circuit with said dynamo, and an electro-magnetic device for cutting in or out the field-coils of said dynamo controlled by a shunt or branch circuit from the secondary battery.

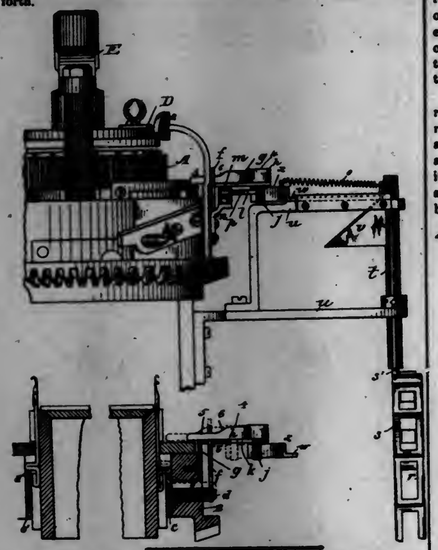
4. The combination, with a dynamo-electric generator, of a secondary battery in circuit with said generator, and an electro-magnetic device controlling the field-magnet circuit of said generator and included in a shunt-circuit from the secondary battery.

5. The combination, with a dynamo-electric generator having independent field-coils, of an electro-magnetic device for connecting said field-coils in multiple arc, a secondary battery controlling said electro-magnetic device and supplied with current from the said dynamo, and translating devices fed by said secondary battery.

6. The combination, with a dynamo-electric generator, of a secondary battery in circuit with said generator, a potential switch placed intermediately of the circuit leading from the dynamo to the battery and comprising a solenoid having two coils of equal resistance, and a movable core carrying contacts severally controlled by both coils of the solenoid and by a retractile spring, and a branch from the main circuit for each coil of the solenoid, one of said branches being of higher resistance than the other.

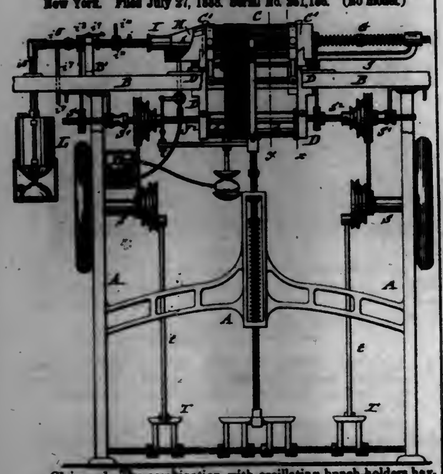
411,302. WIRE MATTRESS BED-BOTTOM. JAMES B. RYAN, New York, N. Y. Filed Aug. 13, 1888. Serial No. 282,604. (No model.)

Claim.—In woven-wire bed-bottoms, the combination of the rectangular central metal plate J, the metal straps C, attached to the bed-frame at their outer ends and connected with the plate J by coil-springs, and the wire mattress lying on top of the plate and straps, as and for the purpose specified.



411,303. KNITTING-MACHINE. ALBERT R. SANDERS and OSCAR L. HERSEY, Laconia, N. H., assignors of one-half to Dennis O'Hara and John O'Hara, Jr., same place. Filed Aug. 20, 1888. Serial No. 282,813. (No model.)

Claim.—1. A needle-cylinder equipped with two sets or series of needles, one set having long latches and the other set having short latches, combined with a revolving cam-cylinder provided with a vertically-adjustable knitting-cam *c*, a vertical link attached to and extending upward from said cam, a cam-piece for moving said link vertically, and a yarn-feed, all as set forth.



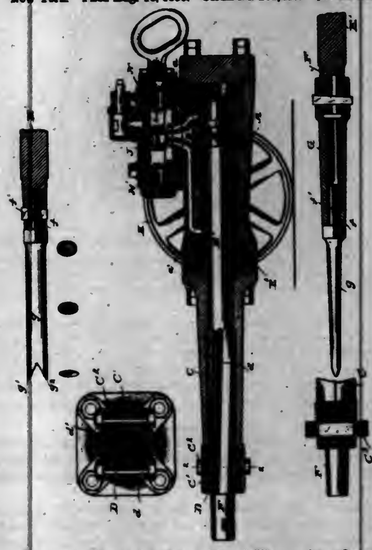
2. A needle-cylinder equipped with two sets or series of needles, one set having long latches and the other set having short latches, combined with a revolving cam-cylinder having two knitting-cams or sets of cams, one of said cams *c* having a vertical link attached to and extending upward therefrom, a cam-piece for moving said link vertically, and a yarn-feed, all as set forth.

3. A needle-cylinder and its needles, combined with a revolving cam-cylinder provided with a slot, a cam *c* in said cylinder, a pin ex-

tended through said slot and connected with said cam, a link connected with said pin and provided with a slot, a bracket connected with said cam-cylinder, and a slide provided with surfaces 4 5 in different planes and an inclined surface 6, said slide being supported on said bracket and extended through the slot in said link, whereby by moving the slide the link and cam may be raised or lowered, as set forth.

411,804. CIGAR-BUNCH-WRAPPING MACHINE. JOHN R. SCHMALZ, New York, N. Y., assignor to the Schmalz Cigar Machine Company, of New York. Filed July 27, 1888. Serial No. 281,186. (No model.)

Claim.—1. The combination, with oscillating bunch-holders having guide-rollers and laterally-adjustable tension-rollers, of two independent endless aprons passing over said rollers, driving-rollers for said aprons, and spring tension-rollers applied to the same, substantially as set forth.



2. The combination, with oscillating bunch-holders having guide-rollers and adjustable tension-rollers, of two independent endless aprons passing over said rollers, driving-rollers for the said aprons, spring tension-rollers pressing on said aprons, and intermediate stretching-rollers between said aprons, substantially as set forth.

3. The combination, with oscillating bunch-holders having guide-rollers and endless aprons guided on the same, and suitable driving-rollers, of a tip-forming block having a cavity open at the outer end, and a longitudinally-reciprocating and spring-actuated rotary tip-finishing thimble extending into the cavity of the tip-forming block, substantially as set forth.

4. The combination, with oscillating bunch-holders having guide-rollers, endless aprons guided on the same, and suitable driving-rollers, of a rotary spring-actuated mandrel arranged at one end of said holders, a tip-forming block having a longitudinally-open cavity at the other end of the holders, and a rotary tip-finishing thimble located in the open end of the tip-forming block and in line with the same and the mandrel, substantially as set forth.

5. The combination, with oscillating bunch-holders having guide-rollers and endless aprons guided on the same, and suitable driving-rollers, of a rotary spring-actuated mandrel at one end of said holders, a tip-forming block at the other end of the holders, said block having a cavity open at the outer end, a rotary and spring-actuated tip-finishing thimble adapted to operate in said cavity, and means for locking said thimble in position so as to clear the cavity of the tip-forming block, substantially as set forth.

411,805. COAL-MINING MACHINE. HENRY C. SERGEANT, New York, N. Y., assignor to the Ingersoll-Sergeant Rock Drill Company, of New York. Filed Aug. 10, 1888. Serial No. 282,419. (No model.)

Claim.—1. The combination, with a drilling-engine, of carrying-wheels independently supported against the sides of the cylinder thereof, and separate longitudinal adjustable supports therefor for adjusting the positions of the carrying-wheels against the cylinder, substantially as described.

2. The combination, with a drilling-engine, of extensions formed on the sides of the cylinder thereof and having longitudinal slots or recesses therein, headed bolts separately secured in and longitudinally adjustable in said slots, independent trunnions secured upon the bolts, and carrying-wheels rotatably mounted upon the trunnions, substantially as described.

3. A drilling-engine having lateral extensions or enlargements upon the cylinder thereof, said extensions formed with longitudinal recesses A^3, said recesses provided with downward openings A^4, headed bolts I, longitudinally adjustable in the recesses, and wheel-supporting trunnions A, securely held in the desired position against the sides of the engine-cylinder by the bolts I, substantially as described.

4. A drilling-engine having lateral extensions or enlargements formed with longitudinal recesses A^3, said recesses provided with downward openings A^4, headed bolts I, longitudinally adjustable in the recesses, and wheel-supporting trunnions A, securely held in the desired position against the sides of the engine by the bolts I, and supporting projections A' on the inner face of the trunnion, to prevent the bolt dropping down when moved past the vertical slot, substantially as described.

5. In a drilling-engine, a tool-carrying piston-rod having a limited twisting axial movement during both its forward and backward movement, substantially as described.

6. A drilling-engine provided with a non-rotating tool-carrying piston-rod and means for imparting thereto a limited twisting movement during its forward and backward movement, the twist being in one direction on the outward stroke and in the reverse upon the return.

7. A drilling-engine provided with a forwardly-extending sleeve, a ribbed bushing adjustably secured in said sleeve and held stationary therein, and a piston-rod formed with grooves registering with the ribs of the bushing and guided therein, whereby a limited twisting movement is imparted to the piston during its forward and backward movement, the twist being in one direction on the outward stroke and in the reverse upon the return.

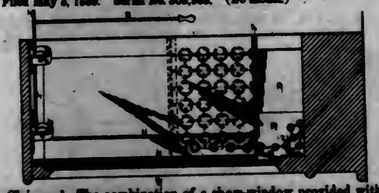
8. A drilling-engine the cylinder of which is provided with a forwardly-extending sleeve divided at its outer end and provided with an adjustable clamp for contracting said outer end, a piston-rod, and a bushing, as D, exterior to the piston-rod and arranged to be inserted in the divided extremity of the sleeve and to be firmly secured therein by the clamp, substantially as described.

9. The tapering oval pick *g*, made tapering toward its front end and formed with a transverse V-shaped notch at its outer extremity, substantially as described.

10. The tapering oval pick *g*, made tapering toward its front end and formed with round sharp edges at its cutting extremity, substantially as described.

411,806. NUT-LOCK. DAVID SCHEIER, Adamsburg, Pa. Filed Mar 21, 1889. Serial No. 304,112. (No model.)

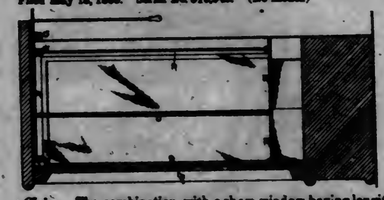
Claim.—The combination, with a pair of nuts and a locking-slide placed between the nuts and held from lateral displacement thereby, of a locking-bolt passed beneath the said nuts and engaging with the locking-slide, substantially as and for the purpose described.



411,807. WIRE HOOK OR HANGER. ISAAC J. TURNER, Princeton, N. J. Filed Apr. 15, 1889. Serial No. 307,308. (No model.)

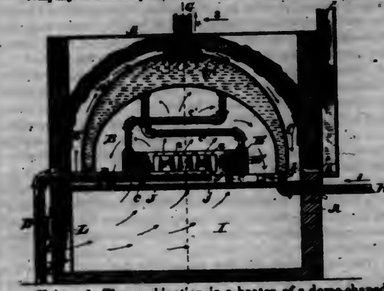
Claim.—1. The herein-described hanger, having a horizontal portion *a*, a return downwardly-extending brace portion *b*, a bearing portion formed with and extending from the lower end of the brace portion, an eye in the end of the bearing portion, and an independent separately removable lower hook which extends through said eye, substantially as set forth.

2. The herein-described hanger, formed in two parts, the upper part having a horizontal portion *a*, a return portion *b*, a vertical bearing portion *b'*, an eye on the end thereof, and a lower hook *c*, extending through said eye and having the shoulder c^2, for the purpose specified.



411,808. WINDOW-GUARD. REIL C. G. VON PEIN, New York, N. Y. Filed May 6, 1889. Serial No. 309,963. (No model.)

Claim.—1. The combination of a show-window provided with a support for the goods which are placed therein, a metallic plate which conforms to the shape of the window, the flexible metallic fabric secured to the under side of the plate, guiding-rods upon which the plate moves, elevating cords, wires, or chains, and guiding-pulleys over which the cords pass back into the store, substantially as shown.



2. The combination of a show-window, the frame E, formed in its bottom, the support F, placed in the window, a flexible metallic fabric secured at its lower end inside of the chamber or receptacle, elevating-cords attached to the metallic fabric, guiding-pulleys over which the cord passes back into the store, and suitable guides upon which the fabric is raised, substantially as described.

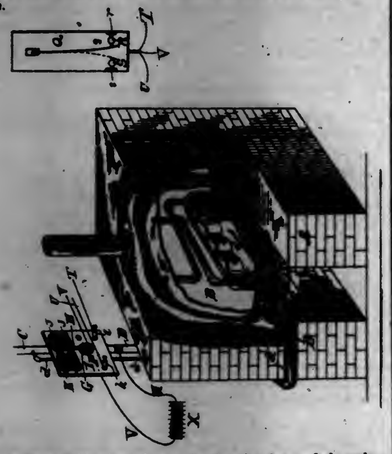
411,809. WINDOW-GUARD. REIL C. G. VON PEIN, New York, N. Y. Filed May 13, 1889. Serial No. 310,549. (No model.)

Claim.—The combination, with a show-window having longitudinal guiding-rods and pulleys secured to the upper portion thereof, of a movable bottom or tray sliding on said rods and elevating cords or chains secured to the bottom or tray and passing over the pulleys, all combined to operate in the manner described.

411,810. HEATING APPARATUS. RICHARD R. WARE, Worcester, Mass., assignor to the Ware Automatic Heat Generator and Regulator Company. Filed May 10, 1889. Serial No. 310,502. (No model.)

Claim.—1. The combination, in a heater, of a dome-shaped combustion-chamber having a substantially continuous inner surface, a fluid-fuel supply-pipe, an inlet for the admission of air to the combustion-chamber, and an outlet for the waste products of combustion, said outlet being located below the plane of ignition of fuel, whereby the waste products of combustion are compelled to pass out below the plane of ignition of fuel, substantially as set forth.

2. The combination, in a heater, of a combustion-chamber, a boiler surrounding the combustion-chamber, a heating-chamber outside of the boiler, a fluid-fuel supply-pipe, an air-inlet, and an outlet for the waste products of combustion, said outlet being located below the plane of ignition of fuel, substantially as set forth.



3. The combination, in a heater, of a boiler provided with an inner heating-chamber, a heating-chamber outside of the boiler, a passage for the products of combustion from the lower part of the inner chamber to the outer chamber, a fluid-fuel supply-pipe opening into the inner chamber, an inlet for the admission of air to the inner chamber, and a final outlet for the waste products of combustion, said final outlet being located on a level or thereabout with the point at which ignition of the fuel occurs, substantially as set forth.

4. In a heater, the combination, with the boiler-support and the fluid-fuel supply, the dome-shaped boiler provided with an internal combustion-chamber having a substantially continuous inner surface and arranged with its lower edge above the boiler-support, of the inclosing-casing, whereby there are formed two chambers with a passage below the boiler for the products of combustion from the combustion-chamber to the outer heating-chamber, substantially as set forth.

411,811. THERMOSTATIC FUEL-CONTROLLER. RICHARD R. WARE, Worcester, Mass., assignor to the Ware Automatic Heat Generator and Regulator Company. Filed Aug. 12, 1888. Serial No. 282,666. (No model.)

Claim.—1. The combination of a combustion-chamber a fuel-supply, a feed-regulator, the reversely-operating electro-magnets, the thermostat, and the electric circuits connecting the thermostat with

the reversely-operating electro-magnets for actuating the fuel-regulator to alternately increase and diminish the heat, substantially as set forth.

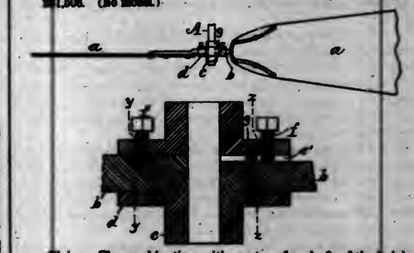
2. The combination of a combustion-chamber, a fuel-supply, a fuel-regulator for increasing and diminishing alternately the amount of fuel, a supplemental continuous supply of fuel, the electro-magnets, the thermostat, and the electric circuits connecting the electro-magnets for operating the fuel-regulator, substantially as set forth.

3. The combination of the furnace, the fuel-supply pipe, the valve in the fuel-supply pipe, electro-magnets connected with the valve, and the thermostat, substantially as set forth.

4. The combination of the combustion-chamber, the fuel-supply, the pilot-pipe, the fuel-regulator, the electro-magnets, the thermostat, and the electric circuits connecting the thermostat with the electro-magnets, substantially as set forth.

5. The combination of the feed-pipe, the electro-magnets, the valve in the feed-pipe, the contact-plates, a switch mounted on the plug of the valve, and the electric circuit whereby the plug of the valve serves to move the switch and is utilized as part of the circuits, substantially as set forth.

6. The combination, with the valve in the fuel-supply pipe, of a pivoted two-ended switch, and the contact-plates, with each of which the switch is made to engage alternately, whereby the contact-plates, the switch, and the valve constitute parts of the electrical circuits, substantially as set forth.

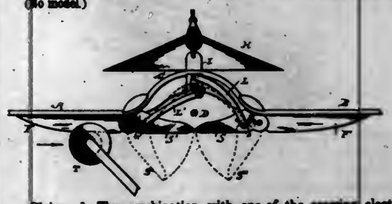


7. In a device for controlling the supply of fluids, the combination of an electro-magnet, an armature pivoted near the same, a valve controlled by such armature, a yoke attached to said valve, an insulated contact-plate upon which one end of said yoke rests, the yoke and plate so related that when the electro-current is sent through such plate and yoke and electro-magnet the latter will be energized, the armature drawn to open or close the valve, as the case may be, and the end of the yoke be moved off of the plate, so as to immediately break the circuit and thus prevent the latter from wasting.

8. In a device for controlling the supply of fluid to a furnace, the combination of an electro-magnet with a circuit embracing said magnet, a thermostat, a battery, a contact-plate, and a movable yoke adapted to engage said contact-plate in one position, a valve to the plug which such yoke is secured, and an armature pivoted in front of the electro-magnet and connected with and controlling the plug, the parts arranged so that when the thermostat closes the circuit a current is instantly sent through to energize the magnet and draw the armature, and by so doing immediately turns the plug to open or close the valve, and breaks the circuit by moving the yoke from the contact-plate.

9. In a device for controlling supply of fluid to a furnace, the combination of two oppositely-placed electro-magnets with an armature pivoted between them, a valve controlled by said armature, a yoke on the plug of said valve, two contact-plates, one of which is always in contact with one end of the yoke, a thermostat having contact-points on opposite sides, and two electric circuits, each of which includes the yoke, battery, and thermostat, while one includes also one contact-point, one electro-magnet, and one contact-plate, so that when the thermostat is inclined to either side sufficiently to reach the contact-point a circuit is established through one of the electro-magnets, the armature is immediately drawn to open or close the valve, and simultaneously the circuit is broken by the movement of the yoke which carried its point off the contact-plate.

411,812. ATTACHMENT FOR BLADES OF ROTARY FANS.



DANIEL WHITLOCK, Newark, N. J. Filed July 31, 1888. Serial No. 281,502. (No model.)

Claim.—The combination, with a rotary fan-shaft, of the hub having the socket *c*, provided with the groove *c'*, extending to the outer end of the socket, the sector-shaped recess connected with the groove in the rear part of the same, the set-screw *f*, inserted through the hub into the groove before the recess, and the fan-blade *a*, having the shank *b*, provided with the stud *g*, fitted to such groove and recess, as and for the purpose set forth.

411,818. OVERHEAD FROG FOR ELECTRIC RAILWAYS.

MERLE J. WHITTEMAR, Lynn, Mass. Filed June 22, 1889. Serial No. 315,147. (No model.)

Claim.—1. The combination, with one of the crossing electric conductors or power-lines for an electric railway, of a self-opening conducting bridge-piece, as and for the purpose described.

2. The combination, with crossing electric conductors for an electric railway, of one or more conducting bridge-pieces suitably hung or supported to swing in a vertical plane and adapted to bridge the gap left in the path of the trolley or contact for one of said conductors at the point where the trolley or contact of the crossing conductor passes.

3. The combination, with the crossing electric conductors for an electric railway, of a conducting bridge-piece supported at one side of the gap, and a lever at the other side connected with said bridge-piece, as and for the purpose described.

4. In an electric railway, a vertically-swinging contact-bridge S, operated by the trolley and normally standing in position to permit the contact or trolley of a crossing conductor to pass without obstruction.

5. The combination of a conductor D, adapted to be engaged by a traveling contact, a second conductor A B, crossing over the first, and a swinging contact-bridge pivoted to swing in a vertical plane in the space below the conductor D and electrically connected with the line or conductor A B.

6. The combination, with electric conductor D, parts of which, at opposite sides of conductor D, are electrically united, of the conducting bridge-piece adapted to bridge the space beneath the conductor D, as and for the purpose described.

411,814. OVERHEAD FROG FOR ELECTRIC RAILWAYS.

MERLE J. WHITTEMAR, Lynn, Mass. Filed June 22, 1889. Serial No. 315,148. (No model.)

Claim.—1. The combination, with an electric conductor engaged by a traveling contact device, of a second conductor continued over the first so as to be electrically continuous, of a movable bridge-piece for the latter adapted to swing or move beneath and in the direction

of the other conductor when engaged by a device carried by the car or vehicle operated by energy derived from the latter.

2. The combination, with crossing electric conductors, of a contact bridge-piece for one of them faced with insulating material on the surfaces engaged by the contact arm or device of the other.

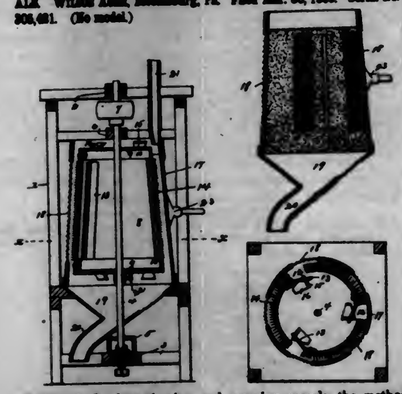
3. The combination, with crossing electric conductors upon which contact devices travel, of a movable contact bridge piece or pieces normally standing in position to maintain the electrical connection for the traveling contact of one wire, means for actuating the same on the passage of the contact devices carried by the vehicle deriving energy from the other wire or conductor, and suitable electrical insulation for preventing electrical connection of the crossing conductors when the bridge-piece is engaged so as to be moved aside.

411,815. INDEX-CIRCULAR.

RICHARD R. WILLIAMS, Brooklyn, N. Y. Filed Oct. 4, 1888. Serial No. 287,227. (No model.)

Claim.—1. A pamphlet having a series of leaves of uniform length and width laid upon one another, with their opposite ends overlapped and united transversely intermediate to such overlapped ends, substantially as herein set forth.

2. A pamphlet having a series of leaves of uniform length and width laid upon one another, with their opposite ends overlapped and united transversely intermediate to such overlapped ends and folded upon their line of union, substantially as herein set forth.



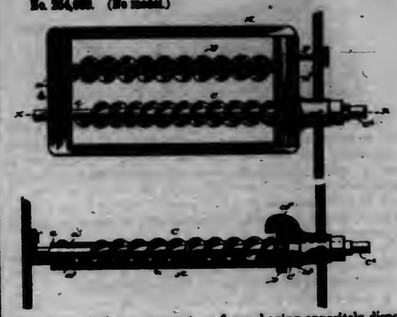
3. A pamphlet having a series of leaves of uniform length and width laid upon one another, with their opposite ends overlapped and united transversely intermediate to such overlapped ends upon a line adapted to form the opposite ends of the leaves into a single series with uniform interspaces when folded upon such line, as and for the purpose set forth.

4. A pamphlet having several series of leaves of uniform length and width, the leaves of each series having their edges coincident, and the several series being laid upon one another with their ends overlapped and united upon a line intermediate to such overlapped ends, and the outer leaves of each series being separately notched to expose the inner leaves of each series, as and for the purpose set forth.

5. A pamphlet consisting in a single series of leaves joined together at one end and successively shortened at their opposite ends for the application of a series of titles, substantially as herein set forth.

411,816. PROCESS OF SCOURING AND DECORTICATING CEREALS.

WILLIS ADAMS, Bloomsburg, Pa. Filed Mar. 30, 1889. Serial No. 305,621. (No model.)

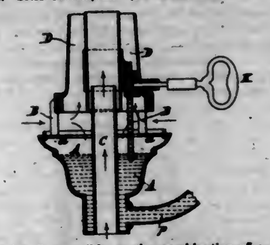


Claim.—1. In decorticating and scouring cereals, the method herein described for preventing heat and promoting the operation of the mill, said method consisting in introducing air through the outer drum and between the same and the vertically-rotating cylinder, substantially as described.

2. In the process of decorticating cereals, the method herein set forth for preventing heat under a heavy load and high speed, the same consisting in inducing a current of air within the inner revolving cylinder and introducing one or more currents of air through the wall of the outer drum in a direction opposite to the direction of rotation of the inner cylinder, substantially as described.

411,817. STOVE-GRATE.

WILLARD J. ARMSTRONG, St. Louis, Mo., assignor to John Uri Mantzk, same place. Filed Nov. 9, 1887. Serial No. 254,669. (No model.)

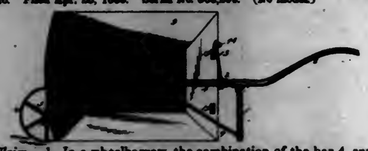


Claim.—1. In a stove-grate, a frame having oppositely-disposed holes near its opposite ends and formed with a hollow journal near one of its sides, in combination with grate-bars within said frame and geared together, the trunnions of one of which bars project through said hollow journal and beyond the outer surface of the main frame, respectively, and the trunnions of the other of which bars end substantially flush with the outer surfaces of said frame, substantially as shown and described, whereby said frame will be pivoted to a stove on one side of its median line, and a catch for retaining the grate in a practically horizontal position.

2. In a stove-grate, a main frame having a hollow journal near one of its sides, for the purpose set forth, the said journal being formed with a square end, in combination with grate-bars pivoted in said main frame and geared together, one of the trunnions of one of which bars extends through and beyond said hollow journal, and also is formed with a squared extremity, and the opposite trunnion of which bar extends beyond the outer surface of said main frame, substantially as shown, and for the purposes set forth.

411,818. LAMP.

CHARLES D. ABEL, London, England. Filed Feb. 7, 1889. Serial No. 299,063. (No model.)



Claim.—1. In an oil-lamp, the combination of a secondary oil-reservoir having an internal vertical air-tube extending above its top wall and opening at its lower end through the wall of the reservoir, a skeleton frame rising from the top of the said reservoir, and a wick-case supported by the skeleton frame wholly above and at a distance from the top wall of the reservoir, substantially as and for the purpose described.

2. In an oil-lamp, the combination of a secondary oil-reservoir having an internal vertical air-tube opening at its upper end through the top wall of the reservoir and at its lower end through the bottom wall of the latter, a skeleton frame rising from the top of the said reservoir, and a wick-case detachably connected at its lower end to the upper end of the skeleton frame and supported thereby wholly above and at a distance from the top wall of the reservoir, substantially as and for the purposes described.

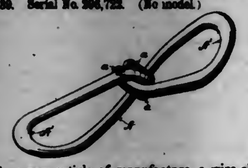
3. The combination, in an oil-lamp, of a secondary reservoir having an internal vertical air-tube rising at its upper end above the top

wall of the reservoir and opening at its lower end through the lower wall portion of the latter, a skeleton frame rising from the top of the secondary reservoir, a wick-case detachably connected to the skeleton frame and supported thereby wholly above and at a distance from the top wall of the reservoir, a main oil-reservoir rising above the secondary reservoir, and a pipe-connection between the two reservoirs, substantially as described.

411,819. WHEELBARROW. BENJAMIN H. BARR, Kansas City, Mo. Filed Apr. 23, 1889. Serial No. 308,299. (No model.)

Claim.—1. In a wheelbarrow, the combination of the bar 4, supported by the wheels 6 and legs 1, and body 9, and suitable means for connecting said body with said bar, whereby the body may be tipped to either side while the wheel and legs remain in an upright position, substantially as described, and for the purpose set forth.

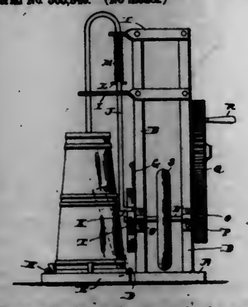
2. In a wheelbarrow, the combination of the bar 4, legs 1, wheel 6, yoke 5, body 9, and hooks 10, substantially as described, and for the purpose set forth.



3. In a wheelbarrow, the combination of the frame 4, having suitable supports, body 9, hooks 10, and collar 11, having a set-screw 12, substantially as described, and for the purpose set forth.

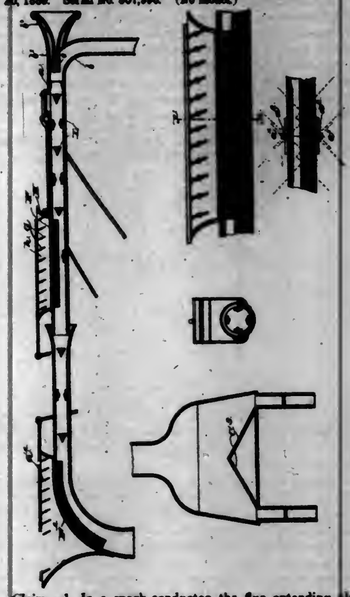
4. In a wheelbarrow, the combination of the legs 1, bar 2, rod 3, bar 4, yoke 5, wheel 6, brace 7, handles 8, body 9, hooks 10, collar 11, spring-catches 13, and legs 15, substantially as described, and for the purpose set forth.

411,820. INCRUSTATION-PREVENTIVE. DAVID R. BOOSHER, St. Louis, Mo. Filed June 21, 1889. Serial No. 315,104. (No specimens.)



Claim.—A boiler compound consisting of oak extract, gambia, sumac, wormwood, and caustic soda, mixed together in about the proportions named.

411,821. CHAIN-LINK. IRVING BROWN, Cleveland, Ohio. Filed Jan. 18, 1889. Serial No. 296,722. (No model.)



Claim.—As a new article of manufacture, a wire chain-link, the end portions of the wire passing each other and twisted around the central portion of the wire, substantially as set forth.

411,822. CHURN. CHARLES T. CARNES, Marietta, Ga. Filed Apr. 3, 1889. Serial No. 305,949. (No model.)

Claim.—The combination of the standards, the arms I I, secured to the same and projecting forward therefrom, the U-shaped bar mounted in said arms and having the dasher secured to the lower end of its outer arm, the inner arm being provided with a transverse pin and having an offset K at its lower end, the spring coiled around the inner arm of said bar between the transverse pin and the upper arm I, the driving-shaft mounted on the standards, the cam on the front end of said shaft bearing against the under side of the offset K, and gearing on the rear standard to rotate the driving-shaft, as specified.

411,828. SPARK-CONDUCTOR. KENT H. CARPER, Salem, Va., assignor to the Carper Spark Conductor Company, same place. Filed Apr. 20, 1889. Serial No. 307,996. (No model.)

Claim.—1. In a spark-conductor, the flue extending along the top of the locomotive and each car, and the smoke-stack having its upper end curved rearwardly and connecting directly with and forming a part of the flue, so as to provide a direct passage for the sparks and products of combustion, said smoke-stack having a flaring mouth mounted on its outside and provided with an opening in its front side, combined with the conical lining mounted in the flaring mouth of the smoke-stack and having its inner end extending through the opening in the front side of the smoke-stack, for the purpose set forth.

2. A spark-conductor provided with a foraminous top portion and a series of movable deflectors arranged above the same, substantially as described.

3. A spark-conductor having a flue provided with a foraminous top portion, a frame extending above the foraminous portion, a series of deflectors pivoted in said frame, and suitable means for operating the deflectors, substantially as described.

4. A spark-conductor having a flue provided with a foraminous top portion, a series of deflectors arranged above the foraminous portion, and a slide adapted to close the foraminous portion, substantially as described.

5. A spark-conductor having a flue provided with a foraminous top portion, a frame extending above the foraminous portion and having curved ends to direct the smoke upward, and a series of deflectors pivoted in said frame, substantially as specified.

6. In a spark-conductor, a flue composed of pipes secured together by hinges having removable pintles, whereby the pipes may be swung to either side of an engine, substantially as described.

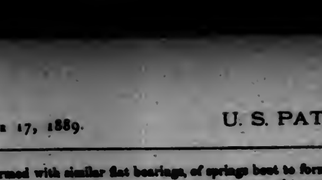
411,824. BOILER-FLUE SCRAPER. WILLIAM T. COCKERILL, Melrose, Mass. Filed Mar. 16, 1888. Renewed Feb. 23, 1889. Serial No. 300,904. (No model.)

Claim.—1. The combination, with the head formed with longitudinal recesses and flat bearings, with scraper-arms pivoted to said head and formed with similar flat bearings, of springs bent to form a short and a long curve, the shorter curve of which is secured between the bearings of the head and the bearings of the scraper-arms, while the longer curve bears against the under side of the said scraper-arms.

2. The combination, with the head formed with the longitudinal recesses, which form walls, and with the flat bearings between said walls, of the scraper-arms pivoted between said walls and formed on their sides near their pivoted ends with similar bearings, and along their under sides with longitudinal grooves and stops, and the tapering springs formed with a long and a short curve and secured with their short curved ends between the walls and the flat bearings of the head and the flat bearings of the scraper-arms and extending with its longer curved ends in the longitudinal grooves of the scraper-arms, substantially as and for the purpose herein set forth.

411,825. COMBINED NEEDLE-THREADER AND THREAD-CUTTER. JAMES COOK, Darlington, S. C. Filed Mar. 8, 1889. Serial No. 302,414. (Model.)

Claim.—The combination of the presser-foot rod and the clamp D, placed thereon, with the screw G, the pivoted needle-threader I, placed upon the screw G and held between the ends of the clamp, the washers placed upon the screw, and the thread-cutter which is clamped between the washers and held in any desired position, substantially as shown.



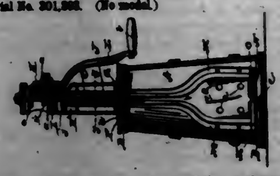
411,826. PACKING FOR JOURNALS. HARRIETT R. DEVLAN, Jersey City, N. J. Filed May 13, 1889. Serial No. 310,633. (Specimens.)

Claim.—1. A packing for journal-boxes, comprising bamboo fiber and pieces of sponge, substantially as described.

2. A packing for journal-boxes, comprising bamboo fiber, pieces of sponge, and a mineral substance—such as asbestus, steatite, or graphite—substantially as described.

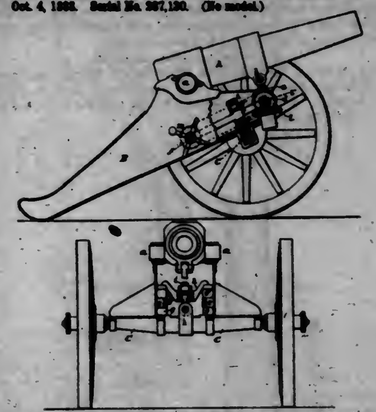
3. A packing for journal-boxes, consisting of bamboo fiber, pieces of sponge, hair, or like fiber, and a mineral substance—such as asbestus, steatite, or graphite—mixed together in about the proportions stated, substantially as described.

411,827. SPARK-ARRESTER. JOHN Q. DONALD, Hartwell, Ga. Filed June 14, 1888. Serial No. 314,184. (No model.)



Claim.—1. The combination, with the casing, of the deflecting-plate P, the plate O, supported by said plate P, and the spring-arms U, rising from the said plate P and adapted to engage the upper end of the casing, as set forth.

2. The combination of the casing having the studs S, the plate N, having notches R in its edge adapted to clear said studs, and the plate M, supported by the said plate N, as set forth.



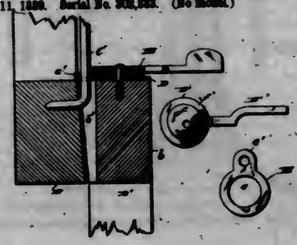
3. The combination of the casing having a discharge-spout near its lower end, the weighted door in said discharge-spout, the arm rising from said door, the elastic buffer on the end of the said arm, and the cord secured to and extending downward from the door, as set forth.

411,828. CHURN. MATTHEW J. DOW, Alba, Mich. Filed Mar. 5, 1889. Serial No. 301,993. (No model.)

Claim.—The combination, in a churn, of the stationary churn-body, the removable cover provided with a gas-vent and having a central circular aperture, the skeleton pillar H, terminating at its upper end in the hollow cylinder H' and provided with the integral horizontal diaphragm I, the central staff C, the concentric tubular staff J, said staffs or shafts C and J being concentric with the skeleton frame or bearing H and its cylindrical extension, and the described mechanism for operating the dashers, substantially as and for the purpose herein shown and set forth.

411,829. TRANSPORTABLE OR FIELD GUN. MAX DEGEN, Magdeburg, Prussia, Germany, assignor to the Grusonwerk, same place. Filed Oct. 4, 1888. Serial No. 287,130. (No model.)

Claim.—1. In a transportable or field gun, the combination, with the gun-carriage, of a gun having trunnions located at or near the first re-enforce and having bearings on the carriage to the rear of the axle, and suitable elevating mechanism, whereby the force of explosion is not exerted on the axle and the rapidity of loading and firing is increased, substantially as herein shown and described.

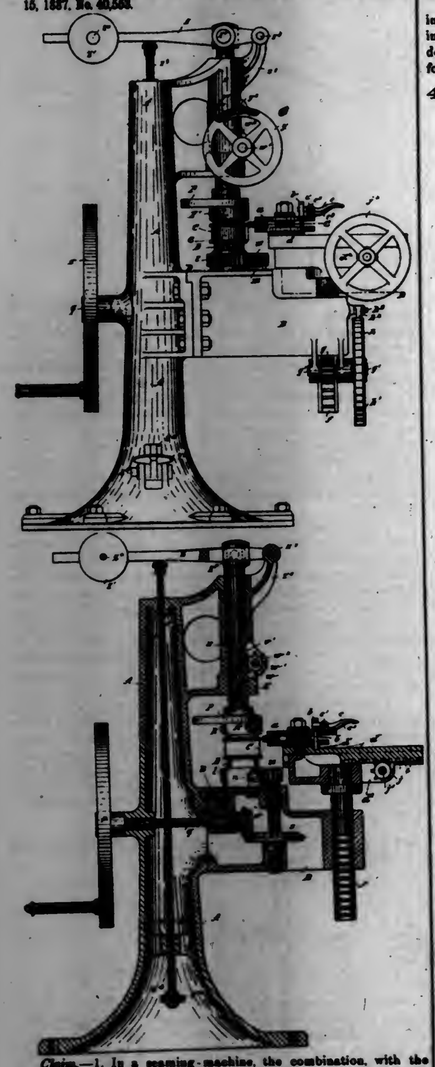


2. In a transportable or field gun, the combination of the gun-carriage, a gun having trunnions located at or near the breech, bearings for said trunnions located on the carriage to the rear of the carriage-axle, and suitable elevating mechanism consisting of the lever or frame *e*, having bearing at one end in the carriage, upper and lower buffers *g g'* at or near its middle, and the elevating-screw at the other end connecting with the gun, all substantially as and for the purposes set forth.

3. In a transportable or field gun, the combination, with the carriage of the gun having its trunnions seated in rear of the carriage-axle, and the elevating mechanism consisting of the screw located between the gun and the carriage, the nut into which the screw works, a hand-wheel, and chain-and-sprocket gearing between the hand-wheel and nut, substantially as and for the purposes set forth.

4. The combination, with the gun-carriage, of the gun mounted thereon, the frame *e*, having cushioned bearing on the carriage, the nut carried by the frame, the screw connected to the gun and bearing in said nut, the hand-wheel, and sprocket-and-chain gearing between the wheel and nut for turning the latter with the former, as explained.

5. In a transportable or field gun, the combination, with the gun-carriage, the gun, and elevating mechanism, of the forked lever *e*, having cross-bar *h*, buffers *g* under the extremities of said cross-bar and supported by the gun-carriage, and a pivoted bolt *i*, passing centrally through the cross-bar for holding it to the carriage, said forked lever carrying the elevating mechanism and wheel and shaft for operating the same, substantially in the manner and for the purpose set forth.



411,830. SASH-HOLDER. DANIEL RAMON, Grafton, Nebr. Filed Mar. 11, 1889. Serial No. 302,823. (No model.)

Claim.—1. A sash-fastener consisting of a disk journaled eccentrically on the upper rail of a lower sash, a loose ring encircling said disk and provided on one side with a small opening, and a vertical rod loosely seated in the opening of the ring and secured to the upper sash, substantially as described.

2. In a sash-fastener, the combination, substantially as described, of the upper and lower sash, a vertical rod secured at its ends to the upper sash, a metal plate secured to and projecting slightly beyond the upper rail of the lower sash at a point opposite said rod, a flanged disk journaled eccentrically on said upper rail, and a ring encircling said disk below the flange and provided with a small opening within which the rod of the upper sash is loosely seated.

411,881. MACHINE FOR SEAMING TIN BOXES. HARTWIG P. F. EWERS, Lübeck, Germany. Filed Sept. 15, 1888. Serial No. 285,536. (No model.) Patented in Germany Oct. 25, 1886, No. 37,411, and Jan. 15, 1887, No. 40,563.

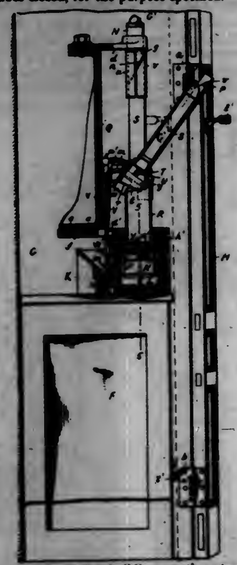
Claim.—1. In a seaming-machine, the combination, with the seaming tool or tools, of two hollow chucks having plain inner walls and similar in shape on the outside to the object to be seamed, which is clamped between them, guide-rollers bearing on the plain inner sides of said chucks, and means for operating the chucks, substantially as set forth.

2. In a seaming-machine, the combination, with the seaming tool or tools, of two hollow chucks between which the object to be seamed is clamped, guide-rollers bearing on the inner sides of said chucks, a guide-rail against which the lower edge of the lower chuck bears, and means for operating the chucks, substantially as set forth.

3. In a seaming-machine, the combination, with the seaming tool or tools, of upper and lower hollow chucks between which the object to be seamed is clamped, guide-rollers bearing on the inner sides of said chucks, a guide-rail against which the lower edge of the lower chuck bears, which latter is provided with cog-teeth, a pinion meshing with said teeth, and suitable mechanism for revolving said pinion, substantially as set forth.

4. In a seaming-machine, the combination, with the work-holding chucks, of an adjustable support, a sliding table received by ways in said support, a rotatable tool-carrier mounted on the table, and a detent for holding the tool-carrier in position, substantially as set forth.

411,882. SAWDUST-ELEVATOR. WILLIAM FRET, New Cumberland, Ohio. Filed Mar. 16, 1889. Serial No. 303,573. (No model.)



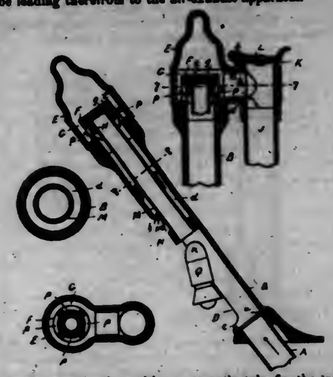
Claim.—1. The combination of the carriage-body, longitudinal suspending-rod having an offset near its rear end, the fixed front sheave, and the movable rear sheave adapted to slide along the suspending-rod, substantially as and for the purpose set forth.

2. The combination of the carriage-body, the hinged bottom sections, the lever fulcrumed in the head-board, links or rods connecting said lever to the inner ends of the bottom sections, the trigger-arm adapted to interlock with the outer end of the lever, and a spring bearing against the free end of the trigger-arm with sufficient force to close the carriage-bottom automatically when pressure against the free end of the trigger-arm is relaxed, substantially as and for the purpose set forth.

411,888. PNEUMATIC MAIL-DISPATCH APPARATUS. JOHN L. GIVEN, Melrose, and GEORGE B. KELLY, Boston, Mass. Filed Mar. 6, 1889. Serial No. 302,046. (No model.)

Claim.—1. The combination, with a building or other structure having a series of stories or rooms, of a series of pneumatic tubes, each leading from a room or story, as desired, to and all terminating at the lower floor or room, or in some desired room or story in such building or other structure, and there having communication with a suitable air-pressure apparatus, each of said tubes having an opening to receive a carrier to be transmitted and an oscillating sectional tube suitably arranged to open and close said opening, and also a valve to open and close communication between the air-operating device and its respective pneumatic or main tube, and all inclosed in a suitable inclosure having a door or cover arranged to be opened and closed, and when closed to engage with and hold said receiving-opening sectional oscillating tubes closed, for the purpose specified.

2. The combination, with a building or other structure having a series of stories or rooms, of a series of pneumatic tubes, each leading from a room or story, as desired, to and all terminating at the lower floor or room, or in some desired room or story in such building or other structure, and there having communication with a suitable air-pressure apparatus, each of said tubes having an opening to receive a carrier to be transmitted and an oscillating sectional tube suitably arranged to open and close said opening, and also a valve to open and close communication between the air-operating device and its respective pneumatic or main tube, and all inclosed in a suitable inclosure having a door or cover arranged to be opened and closed, and when closed to engage with and hold said receiving-opening sectional oscillating tubes closed and, through their connection with the valves, such valves open, for the purpose specified.

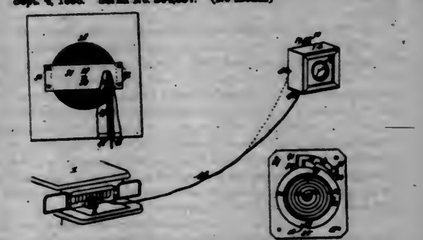


3. The combination, with a pneumatic tube for the transmission therethrough of a carrier having communication with a suitable air-pressure apparatus, of a sectional oscillating tube pivoted to a suitable support and adapted to swing into line with the main or pneumatic tube and to receive such carrier, and connected to a valve between it and the air-motor, substantially as and for the purpose specified.

4. The combination, with a pneumatic tube for the transmission therethrough of a carrier having communication with a suitable air-pressure apparatus and an opening having its ends beveled or angular, provided with semicircular flanges or covers at such ends, of a sectional oscillating tube pivoted to a suitable support and adapted to swing into line with the main or pneumatic tube at such opening, and having its ends beveled or angular the reverse of the beveled or angular ends of the main tube, and provided with semicircular flanges or covers on its ends on the side opposite to those on the main tube, substantially as and for the purpose specified.

411,884. PNEUMATIC CASE-CARRIER APPARATUS. JOHN L. GIVEN, Bridgeport, Conn. Filed May 2, 1889. Serial No. 310,118. (No model.)

Claim.—1. The combination, with a pneumatic tube for the transmission of a carrier therethrough, provided with an opening for the delivery thereat of the carrier, having its end closed and provided with side openings, leaving a space or chamber in said tube between the closed end and side openings, of a chamber surrounding the end of said pneumatic tube, having communication therewith through the side openings, and with a tube leading therefrom to the air-exhaust apparatus, for the purpose specified.

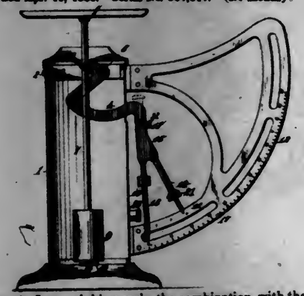


2. The combination, with a pneumatic tube for the transmission of a carrier therethrough, provided with an opening for the delivery thereat of the carrier, and a sliding tube arranged to move back and forth within said tube to open and close said opening, and open from end to end and adapted to receive the carrier to close the opening through said tube, of a chamber surrounding the end of said pneumatic tube and having communication with the pneumatic tube and a tube leading therefrom to the air-exhaust apparatus.

3. The combination, with a pneumatic tube for the transmission of a carrier therethrough, provided with an opening for the delivery thereat of the carrier, and a sliding tube arranged to move back and forth in said tube to open and close said opening, open from end to end and adapted to receive the carrier to close the opening through said sliding tube, said pneumatic tube having a thimble or sleeve secured to its end, having a closed end and side openings F, of a cap E, secured over said sleeve to said tube, forming a chamber having communication with the tube A through said sleeve, and a tube J, leading therefrom to the air-exhaust apparatus, for the purpose specified.

4. The combination, with a pneumatic tube for the transmission of a carrier therethrough, provided with an opening for the delivery thereat of the carrier and an opening or openings at its upper end communicating with a chamber communicating with the air-exhaust apparatus, of a sliding tube within the pneumatic tube of less diameter than the pneumatic tube and having its ends enlarged to fit the pneumatic tube and arranged to slide back and forth therein to open and close said delivery-opening, for the purpose specified.

411,885. FIRE-LIGHTER. WILLIAM HARLEE, St. Louis, Mo. Filed Sept. 4, 1888. Serial No. 284,567. (No model.)



Claim.—1. In a fire-lighter, the combination of the cord for attachment to a match-striker, the spring-drum upon which said cord is adapted to be wound, having ratchet-teeth, the coiled spring within and attached to said drum, the ratchet-pawl 34, adapted to engage said ratchet-teeth, the pendent trigger integral with said pawl, having the trip-lug, and the alarm-clock having a winged winding-key arranged to engage said trip-lug and raise said pawl, substantially as set forth.

2. The combination, with the alarm-clock having the winged winding-key, of a spring-actuated drum having ratchet-teeth, the plate 25, arranged between said clock and drum, a pawl adapted to engage said ratchet-teeth and having a trigger projecting through the slot 41 within reach of said winged key, and the cord 46, attached to said drum and adapted to be wound thereon, substantially as set forth.

3. In a fire-lighter, the combination of the cord 46, for attachment to a match-striker, the spring-actuated drum on which said cord winds, having ratchet-teeth, the alarm-clock 13, arranged with its back to said drum and having a winged winding-key, the case 14, in

which said clock and drum are hung, having in its back the channel or groove 49, through which said cord passes, and the pawl 34, adapted to engage said ratchet-teeth and having a trip-trigger provided with a spur-lug arranged to be struck by the wings of said key to disengage said pawl, substantially as set forth.

411,886. WEIGHING-SCALE. THOMAS H. HERNDON, Birmingham, Ala. Filed Apr. 19, 1889. Serial No. 307,817. (No model.)

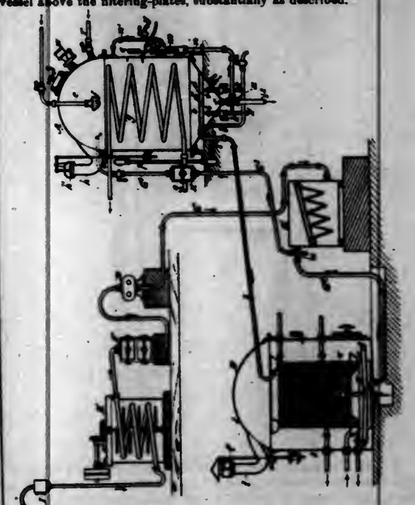
Claim.—1. In a weighing-scale, the combination, with the hollow casing, the spindle having a weight at its lower and a scale-pan at its upper end, and the curved graduated plate, of the index-hand-carrying lever pivoted intermediate its ends at a point inside of the wall of the casing and having the upper end portion, which extends beyond the lever-pivot, connected to the spindle, also within the casing, substantially as described.

2. In a weighing-scale, the combination, with the hollow casing, the spindle having a weight at its lower and a scale-pan at its upper end, and the curved graduated plate, of the bell-crank lever pivoted inside the hollow casing and connected at one end with the spindle, and a head formed with two index-hands and adjustably secured to the other arm of the lever to simultaneously adjust both index-hands in the arc of a circle, substantially as described.

3. The combination, in a weighing-scale, of a casing or frame, a weighted spindle carrying a scale-pan, a curved graduated plate, a lever pivoted between its ends and connected at one extremity with the spindle, and a head having two index-hands and adjustably pivoted to the other extremity of the lever, substantially as described.

4. The combination, in a weighing-scale, of the casing or frame, the weighted spindle having a scale-pan, the curved graduated plate, the bifurcated lever pivoted inside the casing or frame and having its bifurcated end embracing and connected to the spindle, and two index-hands carried by the other end of the lever, substantially as described.

5. The combination, in a weighing-machine, of the casing or frame, the weighted spindle having a scale-pan, the curved graduated plate, the bifurcated lever pivoted inside the casing and having its bifurcated end embracing and connected to the spindle, and a head having two index-hands and adjustably pivoted to the other end of the lever to simultaneously adjust the two hands, substantially as described.

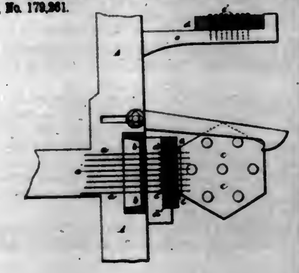


6. The combination, with the casing or frame, a weighted spindle carrying a scale-pan, a curved graduated plate, and a lever pivoted between its ends and connected at its upper end to the spindle, of a head having two index-hands and a set-screw-pivotally and adjustably securing the head to the lever to simultaneously adjust both hands in the arc of a circle, substantially as described.

7. The combination in a weighing-scale, of the hollow casing, a yoke-frame secured in the upper end of the casing, the weighted spindle carrying a scale-pan, the curved graduated plate, and the lever pivotally carried by the yoke-frame inside the casing and connected at one end to the spindle, and two index-hands on the other end of the lever, substantially as described.

411,887. MEANS FOR BOILING, COOLING, &c., BEER. CONSTANTIN HOFFMANN, Rixdorf, Sexto-Mehringen, and LORENZ REINET, Schalke, Schwarzburg-Rudolstadt, Germany. Filed Mar. 6, 1888. Serial No. 266,326. (No model.) Patented in Germany Oct. 17, 1887, No. 41,960.

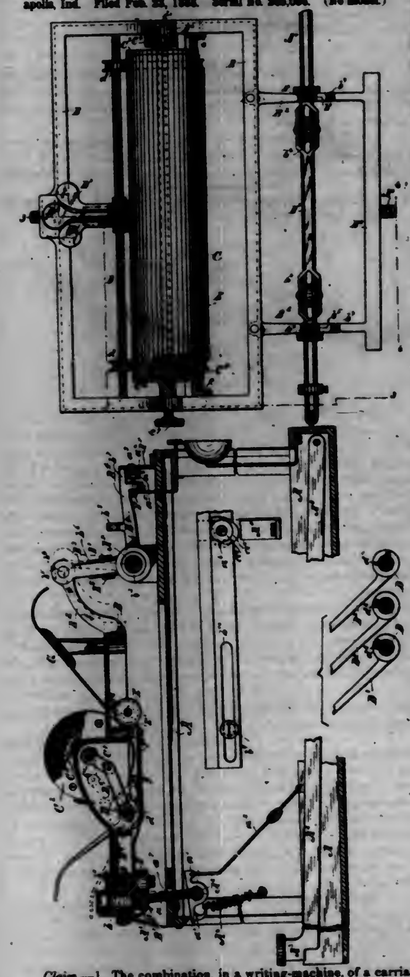
Claim.—1. The combination of the air-tight wort-boiling vessel *a*, the filtering-plates *d d'*, supported above the extreme bottom thereof, the collecting-pipe *k'*, having a branch pipe *k*, communicating at its upper end with the vessel between the extreme lower end of the latter and the filtering-plates for carrying off the clarified wort, and a pump *m*, communicating with the interior of the air-tight vessel at a point above the filtering-plates and at a point below the upper end of the branch pipe of the collecting-pipe for withdrawing the turbid liquid from below the filtering-plates and the upper end of the branch pipe and forcing it into the air-tight vessel above the filtering-plates, substantially as described.



2. An apparatus for boiling and sterilizing beer-wort, consisting of an air-tight vessel *a*, filtering-plates *d d'*, supported above the extreme bottom thereof, a sterilized-air-forcing apparatus for introducing sterilized air into the air-tight vessel, the collecting-pipe *k'*, having a branch pipe *k*, communicating at its upper end with the vessel between the extreme lower end of the latter and the filtering-plates for carrying off the clarified wort, and a pump *m*, communicating with the air-tight vessel for removing the turbid wort from a point below the filtering-plates and the upper end of the branch pipe while the supply of sterilized air to the vessel is shut off, and forcing such turbid liquid into the air-tight vessel above the filtering-plates, substantially as described.

3. An apparatus for boiling and sterilizing beer-wort, consisting of an air-tight vessel *a*, filtering-plates *d d'*, supported above the extreme bottom thereof, a sterilized-air-forcing apparatus for introducing sterilized air into the air-tight vessel, the collecting-pipe *k'*, having a branch pipe *k*, communicating at its upper end with the vessel between the extreme lower end of the latter and the filtering-plates for carrying off the clarified wort, a pump *m*, communicating with the air-tight vessel at a point above the filtering-plates and at a point below the upper end of the branch pipe of the collecting-pipe for withdrawing the turbid liquid from below the filtering-plates and the upper end of the branch pipe while the supply of sterilized air to the vessel is shut off, and forcing such turbid liquid into the air-tight vessel above the filtering-plates therein, the hermetically-closed casing B, and a pipe connected with the collecting-pipe for conducting the hot clarified beer-wort into said closed casing for cooling the beer-wort, substantially as described.

4. The combination, with the wort-boiling vessel *a*, having the filtering-plates *d d'* located therein, of the external pump *m*, having pipes *n n'*, connected, respectively, with the vessel below and above the filtering-plates for withdrawing the turbid liquid from below the filtering-plates and forcing it into the vessel above said plates, substantially as described.



411,888. JACQUARD APPARATUS. SAMUEL HOLDSWORTH, Durham, England. Filed Aug. 10, 1889. Serial No. 321,279. (No model.) Patented in England July 26, 1888, No. 10,811, and in France Aug. 9, 1888, No. 179,961.

Claim.—1. In combination with the trap-board, the ordinary needles *a*, the harness-cords controlled thereby, and with the cylinder *c*, the removable extra needles *e* interposed between the cylinder and needles *a*, and having the ends thereof opposite the ends of needles *a*, the combination being and operating substantially as and for the purpose set forth.

2. The combination, in Jacquard apparatus for weaving carpets and other woven fabrics, with the trap-board, the ordinary needles *a*, the harness-cords controlled thereby, and with the cylinder *c*, of the removable extra needles *e* interposed between said needles *a* and the cylinder and having the ends thereof opposite the ends of needles *a*, extra frame plate or support *d* and brackets *f*, and means for securing the plate or support *d* to the brackets, substantially as and for the purpose set forth.

411,889. TYPE-WRITING MACHINE. WILLIAM F. JUDY, Indianapolis, Ind. Filed Feb. 23, 1889. Serial No. 300,999. (No model.)

Claim.—1. The combination, in a writing-machine, of a carriage pivoted on said machine at its rear side, the frame of said carriage being formed with a joint of limited motion between the pivot and its main portion, said carriage being arranged to slide on said machine, and mechanism, substantially as described, connected with the front of said carriage for operating it back and forth, substantially as set forth.

2. In a writing-machine, the combination of the frame thereof, the carriage-rod, the carriage arranged to slide on said frame, arms B^3, extending out from the rear side of the main portion of said carriage, the arms B^3, pivoted to the outer end of said arms B^3, the joint between said two parts being formed with a stop to limit their movement and said arms B^3 being mounted on said carriage-rod, which is pivoted to the frame of the machine, and means, substantially as described, for operating said carriage back and forth, substantially as set forth.

3. In the carriage of a writing-machine, the combination of the platen, the shaft on which it is mounted, a rock-shaft journaled in front of said platen, said rock-shaft and said platen-shaft being connected at one end, and a series of levers mounted on said rock-shaft and arranged to rotate it different distances, substantially as set forth.

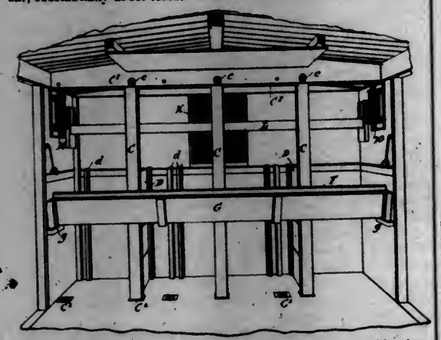
4. In a writing-machine, the combination of the platen C, provided with the head C^2 and mounted loosely on the shaft C, the ratchet-wheel C^1, also mounted on said shaft, said head being provided with a pawl which engages with said ratchet-wheel, the arm C^7, secured on said shaft C, the rock-shaft D, the arm D^4, secured to one end thereof and connected to said arm C^7, and a series of levers D', D^2, and D^3, secured on said rock-shaft to operate it different distances, substantially as set forth.

5. In the carriage of a writing-machine, the combination, with a pivoted rack on its rear side formed with an extended flange, of a standard mounted on the top of the frame of the machine and provided with a pivot-bolt and a roller, and a cam mounted on said pivot-bolt and arranged beneath said flange, substantially as described, and for the purposes specified.

6. In a writing-machine, the combination of the carriage with the rack B^4 pivoted thereto and having a flange b^2 formed thereon, a portion of the under surface of which is notched, the standard A^2, carrying a pivot-bolt, and the roller *c'* and cam c^2, mounted on said pivot-bolt beneath said flange, said roller *c'* being adapted to support said rack as it travels forward, and said cam being formed with a point arranged to engage with the notches on the under side of said flange when the carriage travels back, whereby said cam is turned up and operates to lift said rack out of engagement with the dog and support it in this position during said backward travel, substantially as set forth.

7. The combination, in a writing-machine, of the machine-frame, the carriage mounted to slide thereon, the various mechanisms mounted on said carriage, the rock-shaft, a shifting-rod connected to the rock-shaft, and means, substantially as described, for operating said rock-shaft, said carriage being provided with bearing parts on the front of its frame which are arranged to rest on and engage with said shifting-rod, whereby said carriage may be shifted and a support and slide is provided for its front portion, substantially as set forth.

8. The combination, in a writing-machine, with the carriage thereof, of a platen mounted on a suitable shaft, a rock-shaft mounted in front of said platen, the mechanism connecting said rock-shaft and platen-shaft, a series of levers secured on said rock-shaft to engage with and operate it at different periods of their downward strokes, and a spring arranged to bear against said levers, whereby they are returned to an operative position after having been operated, substantially as set forth.



9. In a writing-machine, the combination of the machine-frame, the carriage-rod A^4, on which the carriage slides and tilts, journaled in bearings on said frame, the carriage provided with the arms B^3 and B^4, hinged together, said hinge being located between said carriage-rod and the main part of the carriage, said arms B^3 being formed with bearings on their lower ends and mounted on said carriage-rod, and the bar B^5, connecting said arms B^3 and provided with the tracks b^3, arranged to run on said carriage-rod, all arranged and operating substantially as described, and for the purpose specified.

411,840. RAILWAY STOCK-CAR. JOHN H. KINBALL, Montreal, Quebec, Canada. Filed July 20, 1888. Serial No. 280,560. (No model.)

Claim.—1. In the herein-described convertible stock-car, the combination, with the main body thereof, of the stall-posts having their inner faces channeled so as to receive the ends of the stall division-boards, the central partition (adapted to have stalls formed on either side) provided with uprights forming channels, in which the rear ends of the stall-divisions are secured, cross-beams secured to the top and side of the car, within which the ends of the stall-posts pass, the car-floor provided with a series of sockets, into which the lower ends of the stall-posts fit, and of the bolts or pins for securing the stall-posts between the cross-beams, substantially as herein shown and described.

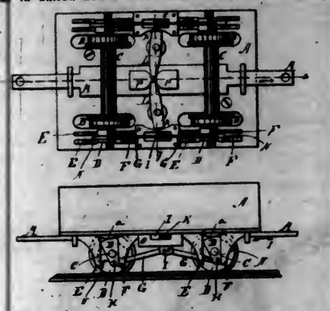
2. In the herein-described railway stock-car, the combination, with the movable stall-posts, said posts fitting at their lower end within the sockets formed in the car-floor, of the transverse beams running the entire width of the car and secured to the top and sides thereof, said transverse beams having an opening or channel formed therebetween into which the upper ends of the stall-posts fit, securing pin

or bolt passing through holes in the side of the transverse beams and into the stall-posts at the top thereof for securing said posts in an adjusted position, stall-divisions having their forward ends secured in grooves or channels formed in the rear face of the stall-posts, and the rear ends thereof within the channel formed by the uprights *d d*, and of the breast-board running the entire width of the car, in front of the stalls, and being secured in the pockets *g g* at either side of the car, substantially as set forth.

3. In the herein-described convertible stock-car, the combination, with the movable horse-stalls, said stalls consisting of the stall-posts adapted to be secured at their lower ends within the sockets formed in the car-floor, and at their upper ends within or between the transverse cross-beams, secured at the car top and sides, and of the stall-divisions secured at their front to the stall-posts and at their rear within the channel or groove between the uprights *d d*, of the breast-board and feed-trough passing in front of the stalls and running the entire width of the car, pockets secured to the car-sides and into which the ends of the breast-board and feed-trough are secured, and of the transverse kicking-bar passing above the stalls near the rear thereof, and having its ends adjustably secured in the pockets located at the side of the car, substantially as herein shown and described.

4. In the herein-described convertible stock railway-car, the combination, with the main body thereof, of the central transverse partition dividing the car into two compartments, movable horse-stalls located on either side of the central partition and at the ends of the car, cross-beams C^2, vertical stall-posts C, the upper ends of which fit between the transverse beams C^2 and the lower ends within the socket *c'*, formed in the car-floor, locking-bolt *c*, passing through the sides of the transverse beams and ends of the stall-posts, so as to secure the latter in position, stall-divisions D, constructed of boards secured at their forward ends within the channel or groove *d'*, formed in the stall-posts, and at their rear ends between the uprights *d d*, breast-board and feed-trough passing in front of the horse-stalls, pockets *g g* at the side of the car into which the ends of the breast-board and feed-trough are secured, transverse adjustable kicking-bar secured above the stalls near the rear thereof, locking-pockets at either side of the car into which the ends of said bar are secured, water-tank secured centrally within the car above the transverse central partition and running the entire width of the car, opening B' in the car-top through which water passes into the water-tank, swinging doors secured to the top of the car for closing said opening, and of the water-distributing pipes *b*, leading from said tank to any desired portion of the car, substantially as set forth.

411,841. CAR-STARTER. HUGH A. KINGSLAND, Belleville, N. J. Filed June 15, 1889. Serial No. 314,203. (No model.)



Claim.—1. The combination, with the car-body, of oscillatory wheels for said body, and a draft-bar connected to said wheels for oscillating the same, substantially as described.

2. The combination, with the car-body, the wheels, and oscillatory boxes for said wheels, of actuating-levers K L for said boxes, and a movable draft-bar connected to said levers, substantially as described.

3. The combination, with the car-body, the wheels, and oscillatory boxes for said wheels, of actuating-levers K L for said boxes, a movable draft-bar M, and slides I, connected to said levers, and links or connections G, extending from the slides to the boxes, substantially as described.

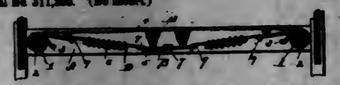
4. The combination, with the car-body and the wheels, of oscillatory boxes for said wheels, slotted hangers for said boxes, and guides or arms N, extending from the boxes to the slots in the hangers, substantially as described.

5. The combination, with a car-body, of oscillatory wheels for said body, said wheels being made to oscillate along the line of travel of the car in unison and in the same direction, substantially as described.

6. The combination, with a car-body, of oscillatory wheels for said body, said wheels made to oscillate along the line of travel of the car, and a brake for restoring the wheels to their starting-point, substantially as described.

7. The combination, with the car-body, the wheels, and oscillatory boxes for said wheels, of curved or angular blocks or plates as interposed between the boxes and the car-body, substantially as described.

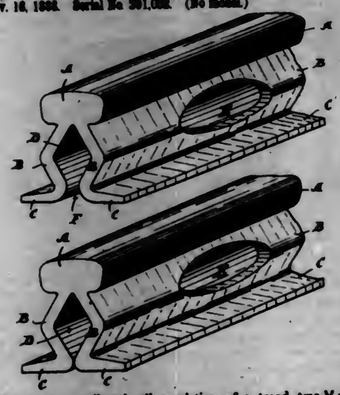
411,842. PLOW. JAMES W. LEAR, Augusta, Tex. Filed Jan. 31, 1889. Serial No. 298,365. (No model.)



Claim.—1. The combination of the central plow-beam 1, a vertically-swinging plow-carrier 13 at each side of the beam pivoted at its front to the front end of said beam, and having at its rear end a depending arm 18, to which the plowshare is secured, a bracket 5, the locking-bolts 22, sliding horizontally through the parts of the bracket to engage the depending arms of the plow-carriers and hold them elevated, a pair of levers pivoted at each side of the plow-beam and one of each pair connected with one of the locking-bolts, the pulleys having chains connected with the lower ends of the other levers of the pairs and with the depending arms of the plow-carriers, and a detent-plate for the levers that connect with the chains, substantially as described.

2. The combination, with a central plow-beam 1, of a plow-carrier 13 at each side thereof having its front end pivoted to the front end of the beam, the pulleys 31, having pulleys 33, of larger diameter, the chains 30, passing around the small pulleys and connected with the rear ends of the plow-carriers, the pivoted swinging levers 27 at opposite sides of the beam, and the chains 34, passing around the large pulleys and connected with the lower ends of the levers, substantially as described.

3. The combination, with a central plow-beam, of plow-carriers having broadened forward ends, each provided with a series of openings to receive a pivot-bolt connecting the plow-carrier to the plow-beam, a lever pivoted to the rear of the plow-beam and having a chain actuating a pulley or drum, a pulley on the same shaft by which the plow-carrier is raised, a lever pivoted to the middle portion of the lever raising the plow, a lock-bolt connected to the lower end of the former lever, and a spring having its ends connected to the said levers, respectively, above the point of pivotal attachment, substantially as described.

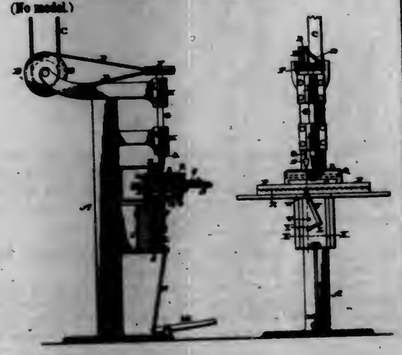


4. The combination, with a central plow-beam having a sod-cutting wheel in front and a ground-wheel in the rear of the plows, of plow-carriers pivotally connected at their forward ends to the forward end of the plow-beam on opposite sides thereof, a shaft mounted in bearings transversely to the plow-beam and having independent pulleys, levers pivoted on opposite sides of the plow-beam in rear of said shaft and having chains operating said pulleys, each of the latter having a drum with a chain connected to the plow-carrier, levers pivoted to the middle portions of the plow-raising levers and having their lower ends connected to locking-bolts which engage and hold the plow-carriers, and springs connected at its ends to each lever, substantially as described.

411,843. SPRING-BED. BENJAMIN R. LEBURN, Glassford, Ohio, assignor of one-half to Alfred Cattanach, same place. Filed May 18, 1889. Serial No. 311,255. (No model.)

Claim.—In a spring-bed, the combination, with the frame, of rollers mounted therein carrying ratchet-wheels, pawls pivoted to the said frame and adapted to engage the ratchet-wheels, longitudinally-extending metallic strips provided with perforations, the terminal strips having one of their ends secured to the rollers, connecting U-shaped slides having their loops arranged adjacent to each other and also having one of their ends extended and bent downwardly, said downwardly-bent ends engaging the perforations of the metallic strips, coiled springs placed around the slides, having their ends bent at right angles to engage the opposite ends of the loops of the adjacent slides, cone-shaped springs having their apices secured to the metallic strips, and a mattress secured to the rollers above the supporting-frame and also bearing upon the base of the conical springs, substantially as set forth.

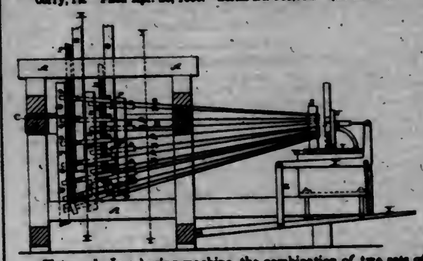
411,844. RAILROAD-RAIL. HOSEA W. LIBBEY, Boston, Mass. Filed Nov. 16, 1888. Serial No. 291,032. (No model.)



Claim.—1. A railroad-rail consisting of a tread, two V-shaped webs set at an angle opposite to each other and separated at their lower ends, and flanges to rest upon the sleepers, substantially as shown and described.

2. A railroad-rail consisting of a tread with two dependent arms, each forming a V-shaped web, and a flange to rest upon the sleepers, the V-shaped webs being set at an angle opposite to each other, whereby a certain amount of elasticity is given to the rail, substantially as set forth.

3. A railroad-rail consisting of the tread A, V-shaped webs B, provided with hand-holes E, and flanges C, substantially as shown and described.



411,845. MACHINE FOR MAKING WOODEN CURRY-COMBS. CLARENCE A. MABLE, Corry, Pa. Filed Apr. 26, 1889. Serial No. 308,649. (No model.)

Claim.—1. The combination of the revolving bit, the laterally-adjustable block-holder placed upon the top of the carriage, the end-wise-movable carriage placed upon the vertically-moving support, the vertically-moving support upon which the carriage is placed, a vertically-moving slide provided with a spring-actuated lever for moving the carriage endwise, and a treadle which first operates the slide for moving the carriage endwise and then raises the support, so as to feed the block being bored to the bit, substantially as shown.

2. The combination of the stationary rotating bit, a stationary punch, and a cup placed above the block-holder with a laterally-adjustable block-holder, an endwise-moving carriage, a vertically-moving support upon which the carriage is placed, a vertically-moving slide, a pivoted spring-actuated lever attached to the slide, and a treadle, substantially as described.

411,846. BRUSH-BLOCK-BORING MACHINE. CLARENCE A. MABLE, Corry, Pa. Filed Apr. 29, 1889. Serial No. 308,994. (No model.)

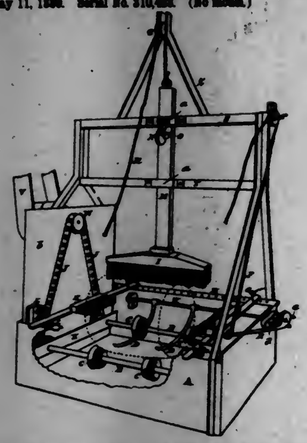
Claim.—1. In a boring-machine, the combination of two sets of spindles provided with operating-pinions and journaled in the journal-plates, the boring-rods connected to the spindles and supported at one end by the form-board, the operating-wheels of unequal size placed upon the shaft, the journal-plates of unequal size, the shaft upon which the journal-plates are placed, a form-board through which the points of the boring-rods pass, and the operating mechanism for presenting the block to the bits, substantially as shown.

2. In a boring-machine, the combination of two sets of spindles, each set arranged in a curved line and one set arranged within the other, operating mechanism for driving the spindles, the boring-rods connected to the two sets of spindles, and the form-board which supports the outer ends of the rods, the two sets of boring-rods being arranged at different angles, substantially as described.

3. The combination of the stationary shaft, the three journal-plates D I F, placed thereon, the two operating-wheels F L, provided with pulleys, the two conical rows of spindles journaled in the journal-plates and provided with pinions to engage with the operating-wheels, the boring-rods, the form-board, and a mechanism for presenting the brush-block to the bits, substantially as set forth.

411,847. PLANT-PROTECTOR. LEBI R. MOORE and MATTHEW S. LOVE, Morley, Mo. Filed June 15, 1889. Serial No. 314,205. (No model.)

Claim.—In a plant-protector, the combination of the base portion, the flanges formed at the top thereof, the wire-gauze resting upon the flanges, and a moisture-collector fitting in the said base portion and above the gauze screen, substantially as described.



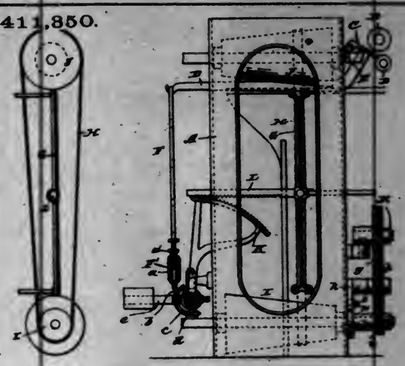
411,848. HEAD-PROTECTOR. BENJAMIN S. MORROW, Bradford, Pa. Filed July 16, 1889. Serial No. 317,695. (No model.)

Claim.—The combination of the spring provided with a pointed end and a series of perforations, with the sliding guides for holding the ends of the spring in contact, and the supporting-clamps for holding a sponge or other heat-non-conducting substance above or in contact with the head, substantially as shown.

411,848.

411,849. WASHING-MACHINE. HENRY HADCOTT, Louisville, Ky. Filed May 11, 1889. Serial No. 310,429. (No model.)

Claim.—1. The combination, with the tank having one of its walls provided with perforations in its upper edge, and the opposite parallel wall provided with the brackets L, of the brushes K, secured by a pin to the perforated wall of the tank, and the opposite ends of said brushes adapted to be adjusted in the brackets L, substantially as specified.



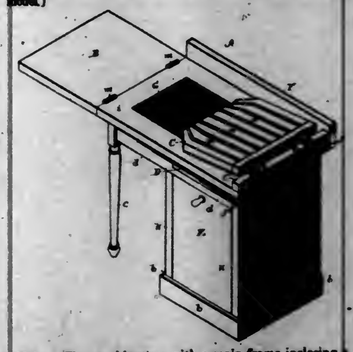
2. The improved barrel-washing machine described, consisting of a tank, shafts journaled longitudinally therein and carrying barrel-supporting rollers, chain-wheels on one end of the shafts, and a shield for said wheels, brushes arranged transversely on the tank and longitudinally and vertically adjustable, a vertical frame having guideways, a vertically-movable brush arranged in said ways, a stop on the brush-bar, a catch on the frame to engage the stop, a guide-pulley in the frame, a hand-rope passing over the pulley and secured to the brush-bar, a rock-shaft journaled in the tank and having curved arms, a lever secured to the outer end of the rock-shaft, and an operating-rope secured to the lever and passing over a pulley in the frame, all substantially as specified.

411,850. EVENING MECHANISM FOR COTTON-OPENERS, &c. JAMES C. PORTER, Pawtucket, R. I. Filed Jan. 28, 1889. Serial No. 297,861. (No model.)

Claim.—1. The combination, with the cone-drums and cone-drum belt, of the belt-shipper, the oscillatory toothed quadrant, and the sliding rack-bar attached to the belt-shipper and at its toothed end resting upon, supported by, and engaging the toothed quadrant, substantially as and for the purposes hereinbefore set forth.

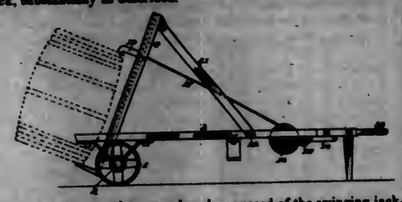
2. The combination, with the cone-drums and cone-drum belt, the belt-shipper, and evening mechanism for operating the same, of the actuating-shaft M, its spur-wheel *g*, the change-gear *i* on the hub or axle of one of the cone-drums, and the intermediate gear A and its supporting-bracket, adjustable in the arc of a circle struck from the axis of spur-wheel *g* as a center, substantially as and for the purposes hereinbefore set forth.

411,850.



411,851. PILLOW-SHAM ADJUSTER. JAMES R. POST, Redwood, Minn. Filed Oct. 15, 1888. Serial No. 288,408. (No model.)

Claim.—The combination of the brackets B, the divided tubular bar A revolubly mounted therein, the rod F, lying partly in each portion of said bar, the bracket B', supporting said rod between said portions, the tags G, attached to the bar, the U-shaped spring-wire I, having its ends fixed, respectively, to the parts of the bar, and the springs H, having their outer ends secured to the brackets B, respectively, and their inner ends engaging slots in the bar, substantially as and for the purpose set forth.



411,852. COMBINED SINK AND KITCHEN-CABINET. JOHN H. RICE, Kansas City, Mo. Filed May 11, 1889. Serial No. 310,394. (No model.)

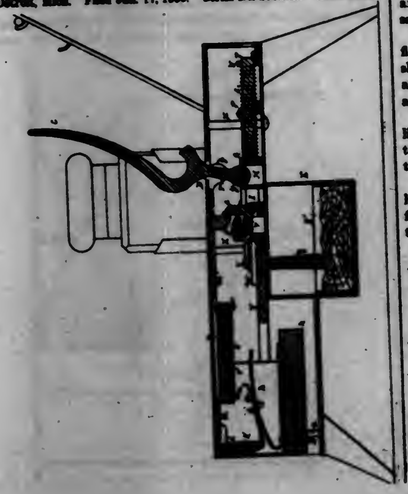
Claim.—The combination, with a main frame inclosing a sink, of a movable strip hinged at one edge to the said frame, and the drain-board hinged at one edge to the free edge of the said strip, whereby when the drain-board is in its operative position it is inclined downward toward the sink, substantially as specified.

411,853. HAND-TRUCK. BENJAH RIDDELL, Rugby, Tenn. Filed June 20, 1888. Serial No. 314,956. (No model.)

Claim.—1. The combination, with a wheeled truck-frame having a windlass, of a hinged swinging jack, a head-block sliding along and swinging with the hinged jack and provided with a foot-piece, a hook for respectively engaging opposite ends of a barrel or other object, and a cord or cable connection between the windlass and head-block, substantially as described.

2. A jack secured to a truck and composed of the swinging jack-frame 4, the head-block 9, hook 10, foot 11, the windlass, and the rope engaged with said head-block, substantially as herein specified.

3. In combination with a truck-frame, the jack 4, secured by the detachable hinge-joint at the lower end and a hinge-brace at the upper end, with windlass-and-cord attachment, whereby said jack may be attached or detached from the truck-frame, substantially as specified.



411,854. CAR-WHEEL. JAMES RENDY, Minneapolis, Minn. Filed Jan. 23, 1889. Serial No. 297,241. (No model.)

Claim.—1. In combination with a car-wheel body, a tire formed with annular ledges upon its inner periphery and near its outer and inner faces for receiving the body, and having a continuous or uncut annular flange projecting from its inner face and adapted to be hammered down over the body for holding it in place, as described.

2. In a car-wheel, the tire formed with annular steps or ledges on its inner periphery and having grooves cut in such ledges, and with a continuous or uncut annular flange projecting from its face, in combination with the body having a smooth-faced flange *k* and provided with annular projecting beads *e f*, adapted to fit in the grooves of the tire and interlock, said flange of the tire being adapted to be hammered down all around over the body to hold it in place, substantially as described.

411,855. ENVELOPE-DAMPING MACHINE. HENRY J. H. SCHMIDT, Detroit, Mich. Filed Jan. 17, 1889. Serial No. 296,645. (No model.)

Claim.—1. In a machine for damping envelopes, the combination, with an actuating-lever, of a spring pressure-block adapted to hold the flap in position, and two brushes playing in tracks each substantially the shape of one-half the gummed edge of the envelope-flap, substantially as shown and described.

2. In a machine for damping envelopes, the combination, with an actuating-lever, of a spring pressure-block adapted to clamp the flap in position to be damped, substantially as shown and described.

3. In a machine for damping envelopes, the combination, with a stop for determining the position of the flap when inserted, of a sheet-metal piece having therein two tracks above the gummed portion of the flap, a movable brush in each of said tracks, and an actuating-lever connected with said brushes, substantially as shown and described.

4. In a machine for damping envelopes, a sheet-metal piece having therein tracks extending in line with the gummed portions of the flap when inserted and hinged at one end, a brush lying in each of said tracks, a water-reservoir beneath the inner end of said tracks, and an actuating-lever connected both with the free end of said sheet-metal piece and with said brushes, whereby the brushes are first raised and then caused to traverse said tracks, substantially as shown and described.

5. In an envelope-damping machine, the combination of the water-reservoir E, the hinged metal piece T, having therein the tracks *f* and the projection *w*, the bell-crank lever *d v*, and the actuating-lever C, connected both with said brushes and with said bell-crank lever *d v*, substantially as and for the purposes set forth.

6. In a machine for damping envelopes, the combination, with an actuating-lever, of two brushes playing in tracks each substantially the shape of one-half the gummed edge of the envelope-flap, substantially as shown and described.

7. In a machine for damping envelopes, the combination of a sheet-metal piece having therein two tracks above the gummed portion of the flap, a movable brush in each of said tracks, and an actuating-lever connected with said brushes, substantially as shown and described.

411,856. INK OR MUCILAGE VESSEL. WILLIAM T. SHAW, London, England. Filed Nov. 28, 1888. Serial No. 292,194. (No model.) Patented in England Dec. 15, 1887, No. 17,268.

Claim.—1. The combination of a liquid-containing vessel and a float of half the specific gravity of the liquid and of the shape obtained by halving a solid of revolution by a plane passing through its axis, said float being pivoted in the vessel and free to turn about the said axis.

2. The combination of a vessel containing ink or mucilage and a float of half the specific gravity of ink or of mucilage and of the shape of the solid generated by a half-revolution of a plane figure about an axis in its plane, the said float being pivoted in the vessel, so as to be free to turn about the said axis.

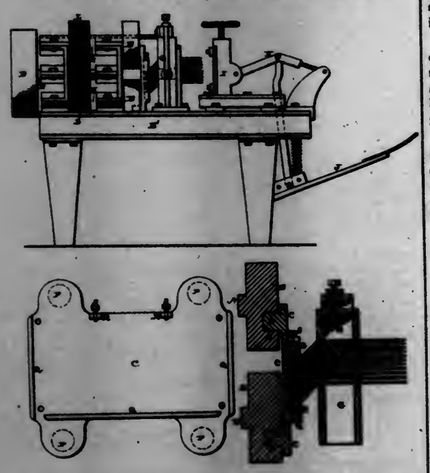
3. The combination, substantially as hereinbefore set forth, of a liquid-containing vessel, the dip-well communicating therewith, and the float pivoted in the liquid-containing vessel and adapted to force the liquid into the dip-well.

4. The combination, substantially as hereinbefore set forth, of a liquid-containing vessel, the dip-well communicating therewith, the float pivoted in the liquid-containing vessel, and the stops for limiting the movement of the pivoted float.

411,857. HARNESS-LOOP. SYLVESTER W. SHIRK, Sylvania, Ohio. Filed Apr. 24, 1888. Serial No. 308,574. (No model.)

Claim.—As an improved article of manufacture, a metallic loop for harness, comprising the metal plate provided with end perforations and intermediate perforation, and also provided near one end with a depression or concavity, and formed or provided above said concavity

with a metal loop, said loop having the upper transverse portion thereof correspondingly convexed, substantially as set forth.

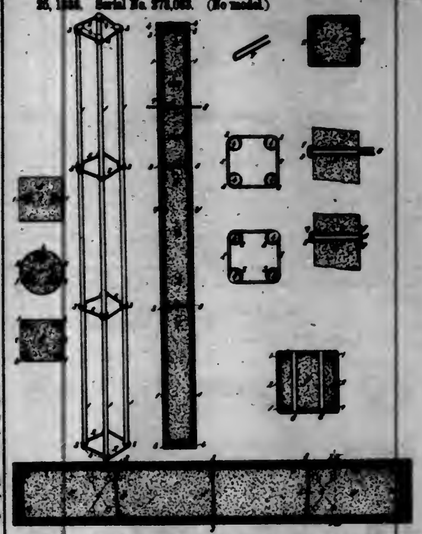


411,858. COMBINED COVER AND PUMP FOR OIL-BARRELS. LEE J. STADELER, York, Pa. Filed June 7, 1889. Serial No. 312,483. (No model.)

Claim.—1. The combination of the barrel-cover B, having annular flange C, beveled re-enforcing plate D and central collar F *f*, bridge H, having the shield or bulge A, provided with ducts leading into the central collar, fixed top plate I, having lip *i*, and hinged hood J, having flange *k*, whereby a shallow pan L is formed, substantially as and for the purpose herein shown and set forth.

2. The combination of the barrel-cover B, constructed as described and having the central sleeve F *f*, the hinged hood J, having rim or flange *k*, adapting it to form a shallow pan L, and the removable pump, substantially as and for the purpose herein shown and set forth.

411,859. MULTIPLE BORING-MACHINE. CHARLES A. STARK, Corry, Pa. Filed May 6, 1889. Serial No. 309,818. (No model.)

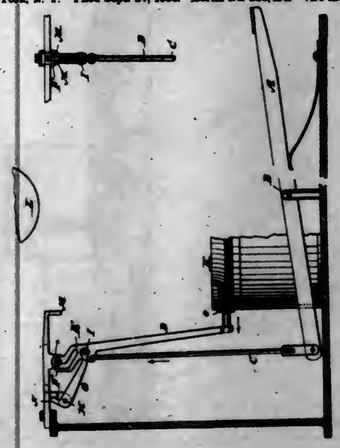


Claim.—1. The combination of the driving-shaft with a driving-wheel, the four shafts provided with wheels which mesh with the driving-wheel, the eccentrically-recessed disks secured to the ends of the shafts, and the bit-driver provided with journals which fit in the recesses in the disks, substantially as shown.

2. A bit-driver provided with a journal at each of its corners and with the flanges Q, lugs, and set-screws S, in combination with the bits provided with cranks at their inner ends, substantially as described.

3. The combination of the shafts N, provided with operating-wheels L, and the driving-shaft provided with a driving-wheel for operating the wheels L, the disks B, provided with eccentric recesses O, and the bit-driver provided with a journal at each of its corners, the crank-carrier, the boring-rods, the journal-plates, and a mechanism for presenting the brush-block to the bits, substantially as set forth.

411,860. POST, RAIL-TIE, BEAM, &c. OMAR A. STEMPEL, St. Louis, Mo., assignor of one-half to Ferdinand Meyrose, same place. Filed June 25, 1888. Serial No. 278,063. (No model.)

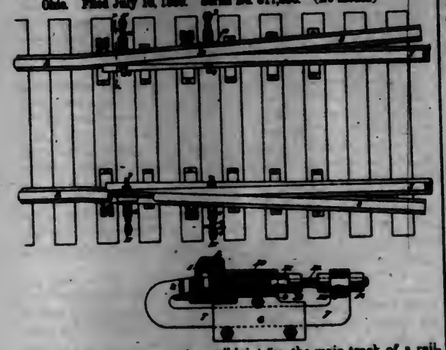


Claim.—1. The combination of the metal frame, the filling and inclosure of imperishable material 5, that protects said frame from the inroads of moisture and rust, and said frame arranged to protect said structure from breakage, the said structure provided with holes for seating staples, and the staples that hold the wires to said posts, seated in said holes, substantially as and for the purpose set forth.

2. The combination of longitudinal metal rods and girding-wires connecting said rods and a filling and inclosure of indestructible material 5, arranged to protect said frame from the inroads of moisture and rust, and said frame arranged to bind and hold said material from breakage, and hooks on the ends of said rods for preventing said wires from slipping off, substantially as set forth.

3. The combination of longitudinal metal rods and girding-wires having tie-coils embracing said rods, a filling and inclosure of indestructible material 5, arranged to protect said frame from the inroads of rust, and said frame arranged to bind and hold said material from breakage, and hooks on both ends of said rods projecting inwardly for preventing said wires from slipping off, substantially as set forth.

411,861. TYPE-WRITING MACHINE. FRANK X. WAGNER, New York, N. Y. Filed Sept. 27, 1888. Serial No. 286,491. (No model.)

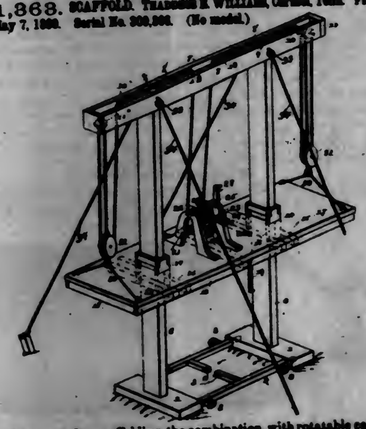


Claim.—1. The combination, with the key A, of a type-bar having a cam-slot E near its butt-end, a pivot F, engaging said cam-slot, a link G, jointed to a fixed part of the machine and to the type-bar, a connection-rod C between the key and type-bar, and an inking device K, substantially as described.

2. The combination, with the key A, of a type-bar having a cam-slot E near its butt-end, a pivot F, engaging said cam-slot, a link G, jointed to a fixed part of the machine and to the type-bar, a connection-rod C between the key and type-bar, a guide M for the type-bar, and an inking device K, substantially as described.

3. The combination, with the key A, of a type-bar having a cam-slot E near its butt-end, a pivot F, engaging said cam-slot, a link G, jointed to a fixed part of the machine and to the type-bar and having a stop N, a connection-rod C between the key and type-bar, and an inking device K, substantially as described.

411,862. EXPANSION RAIL-JOINT. FREDERICK G. WEIR, Cincinnati, Ohio. Filed July 10, 1889. Serial No. 317,020. (No model.)



Claim.—1. An expansion rail-joint for the main track of a railway, composed of the split rails 1, abutting the main rails 2, and secured thereto by a spring-clamp, substantially as herein specified.

2. An expansion rail-joint composed of the split main rails 1, abutting the inside of the main rails 2, the former being held laterally against the latter by a yielding brace abutting the inside of said rails 1, substantially as specified.

3. A rail-clamp composed, substantially, of the arm 7, embracing the split rail 1 and fixed rail 2, and carrying a yielding support, so as to allow rail 1 to move longitudinally with said support, substantially as specified.

4. In combination with the rails 1 and 2, the clamps 7, carrying the brace, and compensating spring supported in the guide-box 6, which holds the clamp laterally and allows it to move longitudinally, substantially as specified.

411,863. SCAFFOLD. THADDEUS R. WILLIAMS, Carmel, Tenn. Filed May 7, 1889. Serial No. 309,991. (No model.)

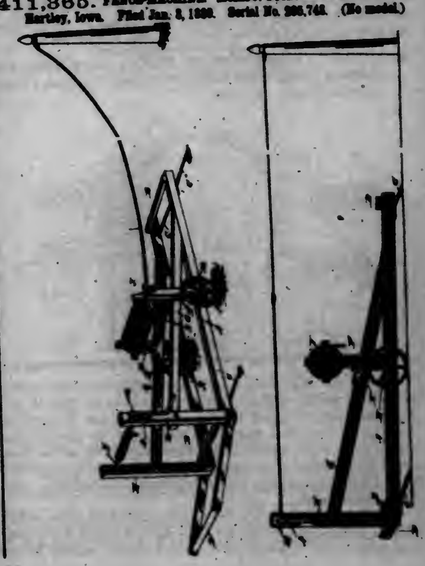
Claim.—1. In a scaffolding, the combination, with rotatable center-bars, of a platform adapted for connection with the bars and means for raising the platform to rotate the bars, substantially as specified.

2. In a scaffolding, the combination, with rotatable center-bars provided with laterally-disposed bars having perforations, of the platform provided with hooks for connection with the bars and means for raising the platform, substantially as specified.

3. The combination, with opposite sills having uprights and connected at their ends by pivotal center-bars having laterally-disposed arms perforated near their ends, of a platform mounted on the standards and provided with opposite depending hooks designed to engage with the perforated arms, and means, substantially as described, for raising the platform.

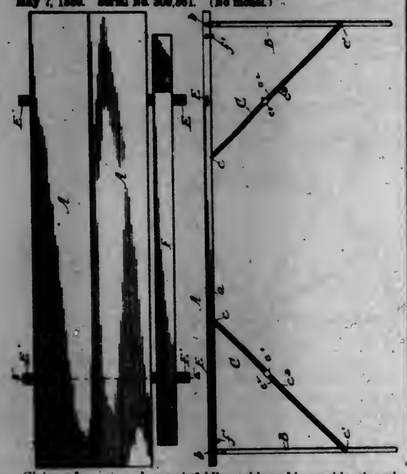
4. The combination, with the uprights 6 and the sills 1, and the oppositely-located bars 7, spaced, as at 8, and carrying the pulleys 10, 12, 11, and 13, of the boring 14, having the bars 15 and the side bars 16, the opposite connecting-links 30, and the blocks 31, the standards 20, and the shaft 21, carrying the gear 22 and ratchet and pawl 23, the shaft 24, mounted above the same and carrying a small gear 25, meshing with the gear 23, the brake-pulley 26 and its lever 27, and the cables connected to the drum-shaft and over the pulleys, as described, and each terminating at and connected to the blocks 31.

411,864. WHEEL. HENRY M. WRIGHT, Green City, Mo. Filed July 2, 1889. Serial No. 316,304. (No model.)



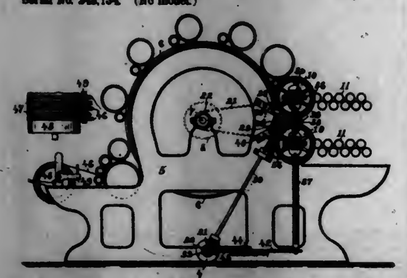
Claim.—1. The combination, with a wheel constructed of wood or other permeable material, of the reservoir or passage formed in the felly and surrounded by the wood on all sides and adapted to receive a supply of oil through an opening extending from the periphery of the felly to the same for transmission to the said wheel, and the tire applied over the felly, substantially in the manner explained.

2. The combination, with a wheel, of a reservoir formed in the wooden rim, a strip flush with and encircling the periphery closing said reservoir, and having an opening fitted with a screw-plug for the introduction of oil, substantially as and for the purposes explained.



3. In a wheel, a reservoir formed in the rim, a strip encircling the periphery and closing said reservoir and having an opening, a removable closure for said opening, and the tire applied over the rim and its strip, substantially as set forth.

411,865. FENCE-MACHINE. MOSES J. YOUNG and LOUIS A. WAITE, Hartley, Iowa. Filed Jan. 8, 1889. Serial No. 296,743. (No model.)



Claim.—The herein-described fence-machine, comprising the side bars A A, the rearwardly-projecting spikes depending from the under sides of said bars, the tongue secured to the front ends of said bars, the standards E F, rising from the said bars, the arched axle secured to the standards F, the carrying-wheels mounted on said axle, the reel mounted between the upper ends of the said standards, the shaft K, mounted between the upper ends of the standards E and carrying a windlass, the ratchet-wheel on said shaft, and the pawl secured to one of said standards and engaging said ratchet-wheel, as set forth.

411,866. PAPER-HANGER'S FOLDING TABLE. HARRY W. ALLEN, Chicago, Ill., assignor of one-half to Robert S. Hobbs, same place. Filed May 7, 1888. Serial No. 309,861. (No model.)

Claim.—In a paper-hanger's folding table and in combination, the longitudinally-folding sections A A, provided with downwardly-projecting strips *a* at their edges and having mortises E, the folding legs B, hinged to the folding sections at each end, so as to fold between the strips *a*, the braces C, each having a joint c^3, formed, as shown and described, with a sliding sleeve c^4, such braces being pivoted at one end to the strips *a* on the inside and at the other end to the folding legs, the cross-pieces D, of strap metal, constructed as shown and secured to the legs in the manner described, and the slats E', adapted to be run through the mortises E, so as to project at either side of the table and form a rest for the straight-edge, as specified.

411,867. CARDING-MACHINE. GEORGE A. ALLISON, Pascoag, R. I., assignor of one-half to Fred. L. Sayles, same place. Filed Aug. 29, 1887. Serial No. 248,134. (No model.)

Claim.—1. In a carding-machine, the combination, with the carding-cylinder and the doffers having the gears 14, of the shaft 16, carrying the pinion 15, located between and meshing with the gears 14, the elliptical gear-wheel mounted on the shaft 16, the elliptical gear 18, the shaft 19, and the band-wheel 20 on the shaft 19, and the band-wheel 22 on the shaft of the carding-cylinder, connected to band-wheel 20 by a belt, all constructed to impart uniformly-variable speed to the doffers, as described.

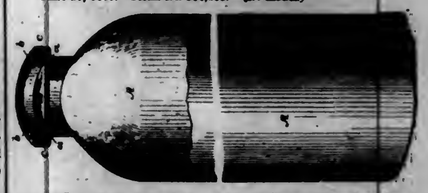
2. The combination, with the card-cylinder and the geared doffers, of a pinion engaging with the doffer-gears, the shaft 19, the elliptical gears 17 and 18, the shaft 30, provided with the gears 29 31, the rocker-arm by which the doffers are reciprocated, and intermediate connections constructed to impart reciprocating motion to the doffers, as described.

3. The combination, with the card-cylinder and the doffers having gears, of a shaft having a pinion engaging said gears, means for driving said shaft at a uniformly-variable speed, the beveled gear 28, the rocker-arm by which the doffers are reciprocated, the shaft 30, provided with the gears 29 and 31, the beveled gear 32, the cam-shaft 33, and connections between the cam-shaft and rocker-arm, whereby the latter is reciprocated, as described.

4. The combination, with the card-cylinder, the doffers, and means for revolving the doffers at a uniformly-variable speed, of the rocker-arm by which the doffers are reciprocated, the beveled gear 28, the shaft 30, provided with the gears 29 and 31, driven by the doffer-rotating mechanism, the shaft 33 and gear-wheel 32, the cam 34, and the cam-rocker connecting the cam with the rocker-arm, as described.

5. The combination, with the card-cylinder and the doffers, of means for rotating said doffers at a uniformly-variable rate of speed, and mechanism for simultaneously reciprocating the doffers, whereby a roving of different colored or kinds of material, and having uniformly-variable diameters throughout its length, is produced, substantially as described.

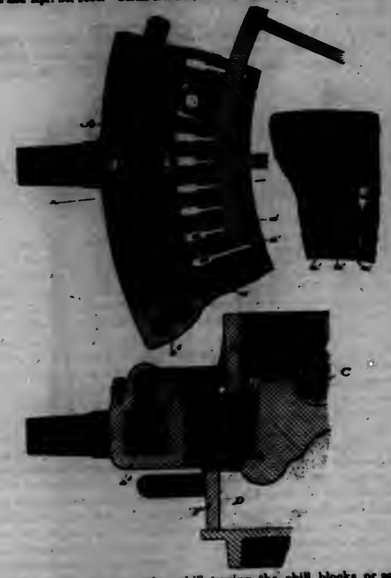
6. The combination, with the card-cylinder and the doffers, of the vertical rocker-arm by which the doffers are reciprocated, mechanism for imparting variable speed to the doffers, the beveled gear 28, the inclined shaft 30, provided with the gears 29 and 31, the beveled gear 32, the shaft 33, the cam 34, the cam-rocker 42, provided with the slot 43, and the adjustable fulcrum-pin 44, constructed to impart reciprocating motion to the doffers, as described.



7. The combination, with the card-cylinder having the doffers, and mechanism for imparting uniformly-variable speed to them, of the pinions 28 and 29, the shaft 30, pinions 31 and 32, the cam 34, the cam-rocker 42, and the rocker-arm 37, constructed to impart reciprocating motion to the doffers, as described.

8. The combination, as hereinbefore set forth, with the main cylinder and the reciprocating doffers supported near thereto and provided with driving means, of a pivoted rocker-bar having the ends of the doffers journaled thereon, and a cam-rocker engaging and rocking the bar, a cam-shaft having a cam engaging the cam-rocker and provided with the pinion-wheel, and a shaft receiving its motion from the said driving means of the doffers and provided with a gear driving the pinion-wheel of the cam-shaft, substantially as and for the purpose herein set forth.

9. The combination, as hereinbefore set forth, with the main cylinder and the reciprocating doffers 10, provided with means for driving the same, and provided with the journals 35, of the pivoted rocker-bar 37, having the journals 35 mounted thereon, the cam-rocker 42, provided with a fulcrum having means of adjustment, the cam-shaft 33, provided with the cam 34 for actuating the cam-rocker, and provided with the bevel-gear 32, the shaft 30, provided with the bevel-gear 31, meshing with the gear 32, and said shaft receiving its motion from the driving means of the doffers, substantially as and for the purpose herein described.

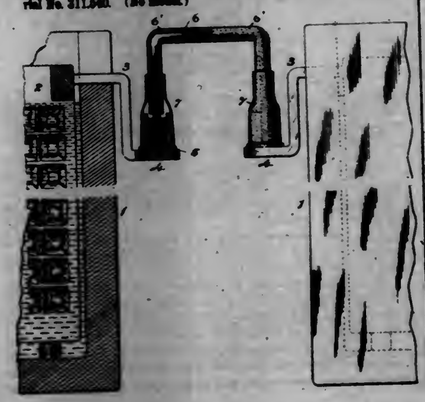


10. The combination, as hereinbefore set forth, with the main cylinder 6, of the reciprocating doffers 10, provided with the journals 35, and having the gears 14, means for driving the doffer-gears, the rocker-bar 37, pivoted at 38, and the bracket 40, provided with the spindle 39 for the rocker-bar, the pivot-bearings 36 for swiveling the journals 35 to the rocker-bar, the cam-rocker 42, provided with eye 41 and slot 43, and the adjustable fulcrum pin or bolt 44, the cam-shaft 33, provided with the gear 32 and the cam 34 for oscillating the cam-rocker, the inclined shaft 30, provided with the bevel-gear 31, meshing with gear 32, and having the bevel-gear 29 mounted upon the upper end thereof, and the bevel-gear 28, driving the gear 29, substantially as and for the purpose herein described.

411,868. MEANS FOR CAPPING AND SEALING MILK-BOTTLES. HARVEY P. BARNHART and SAMUEL L. BARNHART, Potsdam, N. Y. Filed June 29, 1889. Serial No. 316,103. (No model.)

Claim.—The combination, with the jar or bottle hereinbefore described, the circular neck or outlet portion of which comprises upon its interior wall an offset, the upper face of which lies in a plane passing through the neck at a right angle to the longitudinal axis thereof, that part of the wall immediately above said offset being truly cylindric, while the remaining portion of said wall is of slightly-flaring outline, as set forth, of the wafer-like ligneous disk described, saturated with paraffine, seated upon the said offset within the cylindric portion of the neck, whereby without other fastenings the mouth of the bottle is effectually closed, as set forth.

411,869. CONTRACTING CHILL. JACOB H. BARR, Milwaukee, Wis. Filed Apr. 26, 1888. Serial No. 271,953. (No model.)



Claim.—1. A contracting chill having the chill blocks or segments separated by slits or spaces, in combination with a hardened filling of sand and flour in said slits.

2. The contracting chill consisting of the outer ring and the separated chill-blocks extending inward therefrom, in combination with a hard compressible filling, substantially such as described, seated between the chill-blocks and flush with their inner faces.

3. The contractible chill having the separated chill-blocks and the groove at the shoulder, in combination with the compressible filling between the blocks and the sand in the groove.

411,870. CONNECTOR FOR SECONDARY BATTERIES. SIDNEY H. BARRETT, Springfield, Mass., assignor to the Railway Electric Car Lighting and Signal Company, of New York. Filed May 31, 1889. Serial No. 311,940. (No model.)

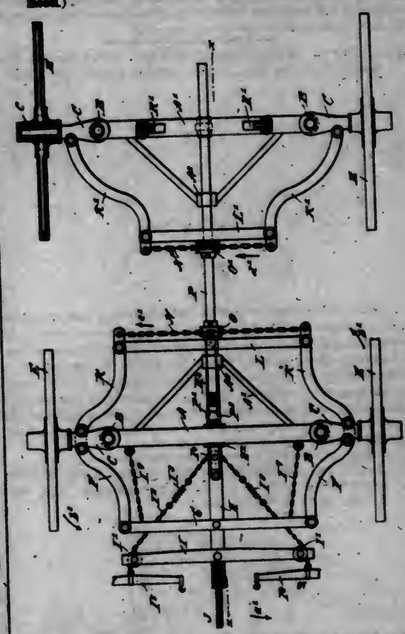
Claim.—1. In a connector for secondary batteries, the combination of mercury-cups on rigid projections from the electrodes, and the immersed U-formed coupler.

2. A flexible and protected connector for secondary batteries, consisting of the combination of rigid integral projections from the electrodes to points outside of and below the cell-tops, the mercury-cups rigidly attached to the respective projections, the U-formed coupling-wire, and the protecting and flexible sleeves.

3. The connector consisting of electrode projections 3, terminating in mercury-cups 4, which receive the ends of the U-formed coupling-wire 5, and the protecting rubber sleeves 7.

4. In a connector for secondary batteries, the combination of electrode projections 3, mercury-cups 4, U-formed coupling-wire 5, having the insulating-coverings 6, and the protecting rubber sleeves 7, for the purposes set forth.

5. A connector for secondary batteries, consisting of the combination of the mercury-cup supported on a battery-electrode, a conductor inserted therein, and a guard or sleeve which surrounds both cup and conductor, as and for the purposes explained.



411,871. BOTTLE-WRAPPER. CHARLES G. BIEDERMAN, Cincinnati, Ohio. Filed Sept. 6, 1888. Serial No. 284,793. (No model.)

Claim.—1. A bottle-wrapper consisting of the husk of an ear of corn having its spathes substantially undisturbed, as and for the purpose set forth.

2. A bottle-wrapper consisting of the husk of an ear of corn having its spathes substantially undisturbed, and provided with devices for retaining them in place, as and for the purpose set forth.

411,872. RUNNING-GEAR FOR VEHICLES. CHARLES A. BUSH and PEARCE H. ARMSTRONG, Celina, Ind.; said Armstrong assignor to David Lamm, same place. Filed Nov. 9, 1888. Serial No. 290,260. (No model.)

Claim.—1. In a running-gear for vehicles, the combination, with a front axle-bar, of axle-heads pivoted on the ends of the said axle-bar, wheels mounted to turn on the said axle-heads, links pivotally connected with the said axle-heads, a lever fulcrumed in its middle and pivotally connected at its outer end with the said links, a pole-carry-

ing arm supporting the said lever and pivoted in the middle of the axle-bar, a doubletree held on the said pivoted arm and supporting rollers, a yielding chain passing over the said rollers and over a roller on the said pivoted arm, and singletrees held on the outer ends of the said yielding chain, substantially as shown and described.

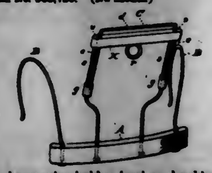
2. In a running-gear for vehicles, the combination, with the front axle-bar and axle-heads pivoted on the same and carried by the wheels, of the rear axle-bar, a shaft mounted to rotate in bearing on the said axle-bars and turned by the swinging motion of the said front axle-heads, and rear axle-heads pivoted on the said rear axle-bar and operated from the said shaft, substantially as described.

3. In a running-gear for vehicles, the combination, with a front axle-bar provided with pivoted axle-heads, of links pivotally connected with the said heads and extending rearwardly, a bar pivotally connecting the said links, a chain secured to the said links, and a shaft mounted to turn and carry a pulley over which passes the said chain, substantially as described.

4. In a running-gear for vehicles, the combination, with a rear axle-bar and axle-heads pivoted on the same, of links pivotally connected with the said axle-heads, an arm pivotally connected with the said links, a chain fastened on the said links, a pulley passing over the said chain, and a shaft held to turn in a bearing on the said axle-bar and carrying the said pulley, substantially as described.

5. In a running-gear for vehicles, the combination, with a front axle-bar and axle-heads pivoted on the said front axle-bar, of a shaft connected at one end by a ball and socket with the said axle-bar and deriving its rotary motion from the swinging of the said axle-heads, substantially as described.

6. In a running-gear for vehicles, the combination, with a front axle-bar and axle-heads pivoted on the said front axle-bar, of a shaft connected at one end by a ball and socket with the said axle-bar and deriving its rotary motion from the swinging of the said axle-heads, a rear axle-bar supporting in suitable bearings the said shaft, and axle-heads pivoted on the said axle-bar and deriving their swinging motion from the said shaft, substantially as described.

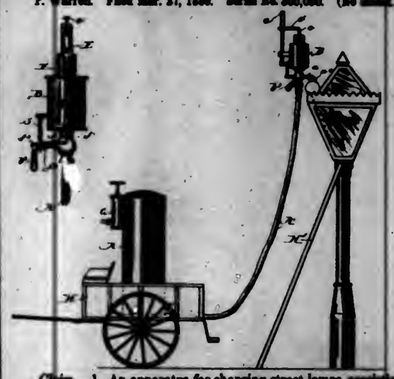


7. In a running-gear, the combination, with the pole, the forward axle, a doubletree pivoted on the pole, and rollers held on the inner end of the pole and the ends of the doubletree, of a chain passing over said rollers, singletrees attached to the ends of the chain, springs interposed in said chain, and limit-chains connecting said first chain with the axle, substantially as shown and described.

411,873. **HORSE-COLLAR FASTENING.** PETER T. BRADLEY, Kansas City, Mo. Filed May 16, 1889. Serial No. 311,215. (No model.)

Claim.—The herein-described collar-fastening, comprising the concaved plates C, to fit in the crease of the collar and receive the hames, and provided at their outer ends with rearwardly-curved lugs or flagers to extend over and engage the hames, the caps or sockets on the adjacent ends of the plates provided with flat abutting faces, the arm projecting beyond the face of one cap or socket and provided with an aperture *D'* and a loop *a*, and the drop-latch mounted on the opposite cap or socket and adapted to pass through said loop and engage the aperture *D'*, substantially as specified.

411,874. **HARMONICA-HOLDER.** ALVIN B. CLARK, Richmond, Ind., assignor of one-half to Oliver T. Knode, same place. Filed Mar. 18, 1889. Serial No. 303,730. (No model.)



Claim.—1. A harmonica-holder having shoulder-hooks in connection with a transverse breast-bar, and holding-jaws above and connected to said breast-bar, substantially as specified.

2. A harmonica-holder having shoulder-hooks in connection with a transverse breast-bar, and spring-actuated holding-jaws above and connected to said breast-bar, substantially as specified.

3. A harmonica-holder consisting of the transverse breast-bar having the shoulder-hooks connected to its ends, the loop-jaw secured to said breast-bar, and having the spring and the movable lower jaw engaging said loop-jaw, substantially as specified.

4. The harmonica-holder consisting of the breast-bar and its pivoted folding shoulder-hooks, the loop-jaw and its springs, and the movable jaw engaging the arms of said loop-jaw, substantially as specified.

411,875. **MEASURING APPARATUS FOR FILLING STREET-LAMPS.** BERNET W. COOKE, Chicago, Ill., assignor of one-third to Charles P. Warren. Filed Mar. 27, 1889. Serial No. 305,089. (No model.)

Claim.—1. An apparatus for charging street-lamps, consisting of a portable oil-supply reservoir and a charge-measuring attachment having an expanding and contracting chamber, in combination with a flexible hose provided with a nozzle adapted to connect the apparatus with the opening of lamps to be filled, and a three-way valve at its junction with said chamber for admitting oil from said reservoir thereto through said hose and discharging the same therefrom through said nozzle, whereby the measuring attachment of such apparatus through the flexibility of said hose is adapted to fill lamps in various positions relative to said apparatus within the reach of said hose, as specified.

2. In a lamp-charging apparatus, the combination, with an expanding charge-measuring chamber, of a spring-pressed two-port valve, one port for opening and closing a way through a pipe into said chamber and the other for opening and closing a way out of said chamber through the opposite end of said pipe, trip mechanism, substantially as described, for holding open said port into said chamber, and a tripping-rod for connecting such trip mechanism with the moving part of such expanding chamber for automatically tripping the same, substantially as specified.

411,876. **DISK HARROW.** MICHAEL DALBY, De Kalb, Ill., assignor to the Daisy Manufacturing Company, same place. Filed Dec. 21, 1888. Serial No. 294,333. (No model.)

Claim.—1. In a disk pulverizer, the combination, with the disks, their hub-sleeves, and offset rings, of the coupling-sleeves and the sectional dirt-guards having end flanges engaging the offsets of said rings, substantially as specified.

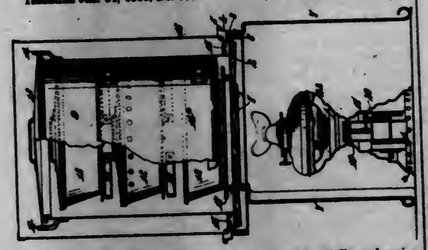
2. A disk pulverizer having two angularly-adjustable gangs of separately-revolving pairs of disks and automatically-disengaging gangs of cleaners, substantially as specified.

3. In a disk pulverizer, the combination, with the gang of disks, of the main coupling-sleeve E, its connections, and the inner coupling-sleeve F, of the adjusting-lever and its crooked connections with the latter coupling-sleeve, substantially as specified.

4. A disk pulverizer having gangs of disks connected to the draft-frame nearer their outer than their inner ends, adjustable levers have attached to said frame above said gangs, and coupling-sleeves nearer

their inner than their outer ends, carrying upright bearings G and attached by crossing connections to the adjusting-levers, substantially as specified.

5. In a disk harrow or pulverizer, the gangs of disks, in combination with the gangs of cleaners attached to a swinging bracket pivoted at or near the axle, and the lever whereby a majority of the cleaners are brought into contact with the disks by a motion in the direction the disks revolve, substantially as specified.



411,877. **ARTIFICIAL LIMB.** FRANK H. FAIRCHILD, Atchison, Kans. Filed Mar. 13, 1889. Serial No. 303,067. (Model.)

Claim.—1. In an artificial leg, the combination of the lower leg-section having the block L at its lower end and rear side, and the foot articulated to the lower leg-section and having the elastic cushion I bearing against the front side of block L, and the elastic cushion H, bearing under the lower end of said block, substantially as described.

2. The artificial limb having the lower leg-section provided with the block L, the foot articulated to the said lower leg-section and having the sections F F', with their opposing sides, at the joint inclined upward from each other, the hinge K on the lower side of the foot-sections and connecting the same together, the wedge-shaped elastic cushion G in the foot-joint, the plates *d* on the foot-sections and bearing on the said cushion, and the elastic cushions I H, recessed in the heel portion of foot-section F, the said cushion I bearing against the front side of block L, and the said cushion H bearing against the lower end of said block, substantially as described.

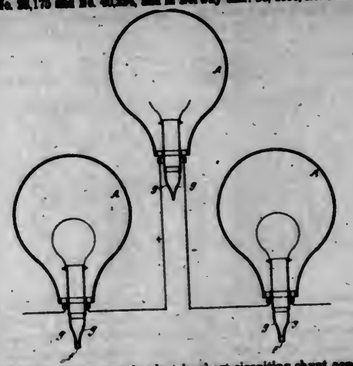
411,878. **PROCESS, METHOD, OR ART OF COOKING EDIBLES.** HENRY FERRIER, London, England, assignor to Frank L. Weaver, Hamilton, Canada. Filed July 26, 1889. Serial No. 318,488. (No model.) Patented in England Nov. 16, 1887, No. 15,734; in France Dec. 30, 1887, No. 187,734; in Belgium Dec. 31, 1887, No. 80,013; in Cape of Good Hope Apr. 4, 1888; in Natal Apr. 5, 1888, No. 13; in Spain Sept. 10, 1888, No. 8,672; in Canada Jan. 18, 1889, No. 26,976; in India Jan. 23, 1889, No. 18; in South Australia Jan. 25, 1889, No. 1,239; in Victoria Jan. 28, 1889, No. 6,494; in New South Wales Jan. 30, 1889, No. 1,909, and in Tasmania Jan. 31, 1889, No. 605.

Claim.—1. The process, method, or art, substantially as hereinbefore set forth, of cooking meats, vegetables, and other articles of food, which consists in subjecting them to a gradually-increasing temperature in an insulated closed chamber, and to an atmosphere of steam constantly and uniformly produced and condensed therein, generated by an outer heat-creating agent, whereby the articles of food are subjected to a gentle, persistent, and slowly-increasing bath heat, which penetrates and permeates each of said articles, substantially as described.

2. The process, method, or art herein set forth of cooking meat, vegetables, and other articles of food, which consists in subjecting them to a gradually-increasing temperature in a closed chamber or vessel, and to an atmosphere of steam constantly produced and condensed therein, generated by a gentle, regulated heat applied to one part of said chamber, whereby a gentle, persistent, slowly-increasing bath heat is produced and housed within said chamber, and caused to penetrate and permeate the articles of food, substantially as described.

411,879. **GRATE-BAR.** RUSSELL J. GORDON, Greenville, Mich., assignor of one-half to Chas. S. Hosier, same place. Filed Apr. 3, 1889. Serial No. 305,713. (No model.)

Claim.—1. A hollow grate-bar having the valved openings on its upper side and adapted to be connected with a pipe or duct, whereby a blast of air may be forced through the said hollow grate-bar, substantially as described.



2. A grate-bar having the bore and provided with the valve-seat in its upper side communicating with the bore, and the gravity-valve in the said valve-seat adapted to be opened by the pressure of a blast of air within the bore, substantially as described.

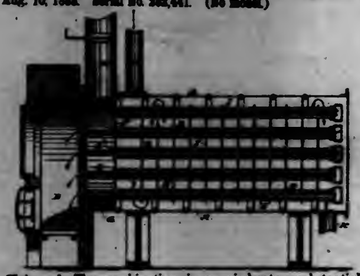
3. The hollow grate-bar having the valve-seats, in combination with the valves arranged in the said valve-seats, the stems or rods depending from said valves and extending through the lower side of the grate-bar, and the adjusting-nuts screwed on the lower end of said stems or rods, for the purposes set forth, substantially as described.

4. The hollow grate-bar having the valved openings and provided at one end with the valve having the operating-lever, whereby said valves may be opened, and means, substantially as set forth, to force a blast of air through the hollow grate-bar, substantially as described.

5. The hollow grate-bar having the valves provided with the depending stem S, the bell-crank lever T, connected to the said stem, and the operating-rod connected to the said bell-crank lever, substantially as described.

411,880. **CUT-OUT.** FRIEDRICH G. A. HELLER, Berlin, Germany, assignor to Siemens & Halske, same place. Filed Feb. 2, 1889. Serial No. 298,122. (No model.) Patented in Germany Feb. 26, 1888, No. 45,982; in France Mar. 9, 1888, No. 189,230; in Belgium Mar. 9, 1888, No. 80,948; in Sweden Mar. 9, 1888, No. 1,685; in Italy Mar. 9, 1888, XXII, 20,131, XLV, 446, XXII, 24,808, XLVIII, 60; in Austria-Hungary Mar. 9, 1888, No. 26,175 and No. 40,394, and in Norway Mar. 20, 1888, No. 606.

Claim.—An automatic electric short-circuiting shunt consisting of opposed springs *g g*, connected to the line-wires upon opposite sides of a lamp and depending from the bottom of it, and the non-metallic body *f*, interposed between the lower ends of the said springs and composed of wax and pulverized graphite, substantially as and for the purpose set forth.

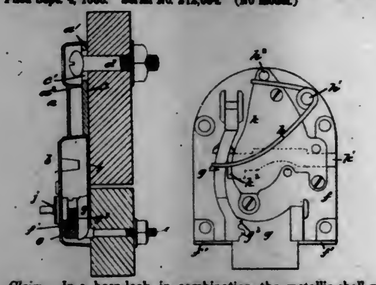


411,881. **OYSTER-OPENER.** JOHN P. HOFFMANN, Baltimore, Md., assignor of one-half to Elias August Volk, same place. Filed Feb. 1, 1889. Serial No. 298,309. (No model.)

Claim.—The oyster-opening implement consisting of the handle A, having attached a straight opening-blade D, which projects forward in a direction longitudinal with respect to the handle, and said handle

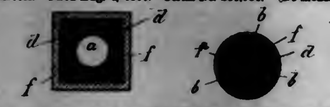
also having a hammer B, whose shank *c* curves laterally from the handle and then projects forward in the same direction as the opening-blade.

411,382. AIR-HEATER. LEVI HUSSEY, New York, N. Y. Filed Aug. 10, 1888. Serial No. 282,641. (No model.)



Claim.—1. The combination, in an air-heater, substantially as herein described, of the cylinder A, having the air-inlet J and air-outlet K, the flues D, fixed to the head of the cylinder at the air-inlet end thereof, the furnace B, and the furnace-flues C, movably arranged within the cylinder-flues.

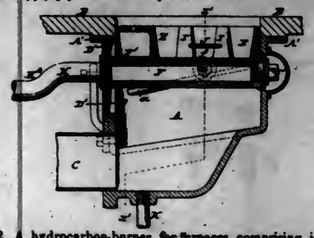
2. The combination of the cylinder A, the flues D, fixed to the head F, the diaphragms I, arranged to conduct the air back and forth laterally across the cylinder, the furnace B, and the furnace-flues C, removably arranged within the flues D.



3. The combination of the cylinder A, having air inlet and outlet J and K, the flues D, secured to the cylinder at its air-inlet end only, the diaphragms I, for directing the air back and forth across the cylinder, the furnace B, and the furnace-flues C, arranged within the flues D.

411,383. HASP-LOCK. EDGAR KNIGHT, Saybrook, Conn., assignor to the Stoddard Lock and Manufacturing Company, New York, N. Y. Filed Sept. 4, 1888. Serial No. 282,634. (No model.)

Claim.—In a hasp-lock, in combination, the metallic shell with narrow shank and broader lock-receiving portion that is free from recessed projections, the slotted filling-piece secured to the under side of the shank and extending from wall to wall, the pivot-bolt, the staple, and the spring-projecting latch-bolt borne in the shell, all substantially as described.



411,384. PACKING FOR STEAM-PIPES. CHARLES T. LEE, Boston, Mass., assignor of one-half to the Gould & Watson Company, of Massachusetts. Filed Aug. 4, 1888. Serial No. 281,981. (No model.)

Claim.—A non-conductor for heat or electricity, consisting of comminuted mica in a loose state and unincorporated with other material, and retained in position around the pipe or conductor by a suitable box or casing, substantially as shown and described.

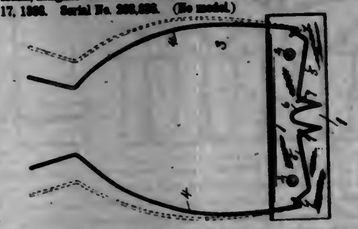
411,385. HYDROCARBON-BURNER FOR FURNACES. ARTHUR LEETE, Chicago, Ill., assignor to the Leete Iron Smelting Company, same place. Filed July 21, 1888. Serial No. 280,681. (No model.)

Claim.—1. A hydrocarbon-burner for furnaces, comprising, in combination, an open-topped cast-metal air trunk or casing formed with closed sides, bottom, and a marginal top flange, by which it is adapted to form the bottom of the combustion-chamber, an entrance-door in one of its sides, a liquid-fuel tray arranged within the same and formed with a series of blast-nipples extending from the bottom to or near the top of the tray, and an underlying supply-passage F and the supply-pipe H, essentially as set forth.

2. A hydrocarbon-burner for furnaces, comprising, in combination, an open-topped cast-metal air trunk or casing formed with closed sides and bottom, inclined ledges upon the interior surface of its sides, and an entrance-door in one of its sides, a liquid-fuel tray supported within the casing by means of said inclined ledges, and formed with a series of blast-nipples extending from the bottom to or near the top of the tray, and an underlying supply-passage F and the supply-pipe H, essentially as set forth.

3. A hydrocarbon-burner for furnaces, comprising, in combination, an open-topped cast-metal air trunk or casing formed with closed sides and bottom, an entrance-door in one of its sides, and an attaching marginal flange at its top, a liquid-fuel-containing tray arranged within said casing and provided with a series of air-conducting nozzles for discharging volumes of air at the surface of the liquid fuel, the fuel-supply H and passage F, for conducting oil to the tray or burner, and the drain-pipe K, connected to the bottom of the air trunk or casing, essentially as set forth.

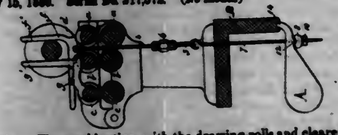
411,386. COMBINED METAL-SHEARS AND TIRE-UPSETTER. MORGAN C. MALONE, Palmyra, Ill., assignor of one-half to Paul B. Spooner, same place. Filed Feb. 26, 1889. Serial No. 301,223. (No model.)



Claim.—1. The combination of the stationary jaw having the standard C erected at one end and provided with the transverse teeth D, the swinging jaw pivoted to the stationary jaw and having a bifurcation at its free end passing around the standard, and the operating-lever pivoted in said bifurcation and provided at its end with the segmental rack-bar engaging the teeth on the standard, as set forth.

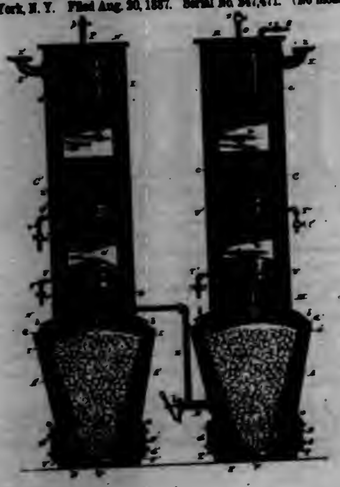
2. The combination of the stationary jaw having the downward extension B, the upper jaw pivoted to the stationary jaws and having an offset N, the ribs M O, secured to the extension B and the offset N, respectively, and the cam-levers pivoted on said ribs, as set forth.

3. The combination of the stationary jaw having the recess K, and the downward extension B, provided with the recess L, forming a continuation of the recess K, the upper jaw pivoted to the stationary jaw and having an offset N, the ribs M O, and the cam-levers pivoted to said ribs and having teeth in their edges, as set forth.



4. The combined shears and tire-upsetter comprising the stationary jaw, the standard C, erected at one end of the same and having the transverse teeth E, the extension B, depending from the stationary jaw, the moving jaw pivoted to the stationary jaw and having a bifurcation at its free end passing around the standard C, the lever pivoted in said bifurcation and having a segmental rack-bar engaging the teeth of the standard C, the offset N on the swinging jaw, the ribs M O on the extension B and the offset N, respectively, the plates P, secured in the ends of said extension and offset, and the cam-levers pivoted to the ribs above said plates, as set forth.

411,387. HAT AND COAT HOLDER. THOMAS J. MANNING, Grafton, Mass., assignor of one-half to Charles L. Leonard, same place. Filed Dec. 17, 1888. Serial No. 293,023. (No model.)

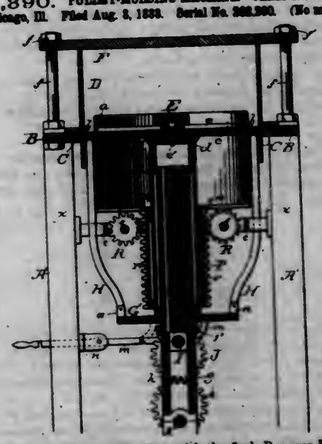


Claim.—As an improved article of manufacture, the herein-described hat and coat holder, made out of one piece of wire and consisting of the two single outwardly and upwardly extending curved arms 4, with their upper free ends bent as shown and their lower ends secured by staples 7, from which point the arms 4 are flexible, and the base part 5, extending substantially at right angles to the arms 4 and integral with said arms, said base 5 secured by staples 7 near its central part, which is bent to form a hook 6, which acts as a stop or support for the lower edge of the brim of the hat, all constructed substantially as shown and described.

411,388. GUIDE FOR TOP-ROLL CLEARERS. JOHN T. MEARS, Taunton, Mass., assignor to the Mason Machine Works, same place. Filed July 15, 1889. Serial No. 317,572. (No model.)

Claim.—The combination, with the drawing-rolls and clearer-roll, of a front and back saddle, each provided with a horn to receive between them the neck of clearer-roll, substantially as described.

411,389. PROCESS OF AND APPARATUS FOR MANUFACTURING GAS. MARCELLUS A. MOSES, Chicago, Ill., and THEODORE G. STARBUCK, New York, N. Y. Filed Aug. 20, 1887. Serial No. 247,471. (No model.)



Claim.—1. The process of manufacturing gas, which consists in highly heating a body of high-grade hard coal or coke by rapid combustion and burning the resulting gaseous products with air and storing the heat in a body of refractory material, and at the same time burning a body of slack or low-grade cheap fuel with a slow combustion, and by means of the resulting gaseous products heating a second body of refractory material, then suspending the combustion, then superheating steam by passing it through the body of refractory material heated by the waste gaseous products of the hard coal or coke, then decomposing such steam by passing it through the body of incandescent hard coal or coke, and then passing the resulting gases, together with a hydrocarbon, through the body of refractory material previously heated by the gaseous products arising from the low-grade fuel for producing a fixed illuminating-gas.

2. The process of manufacturing gas, which consists in raising a body of hard coal or coke to a state of incandescence by rapid combustion with air, burning the resulting gaseous products with air and storing the heat in a body of refractory material, and at the same time heating a second body of refractory material by the combustion of gaseous products arising from a separate body of cheap low-grade fuel, then suspending the process of combustion and passing a hydrocarbon, with steam in excess, through the body of refractory material heated by the waste products of combustion of the hard coal or coke, decomposing the steam into carbonic-acid and hydrogen gas, then passing such gases through the incandescent hard coal or coke to convert the carbonic-acid gas into carbonic oxide and the hydrogen into light carbureted hydrogen; and then passing the carbonic oxide and carbureted hydrogen, together with sufficient hydrocarbon to make an illuminating-gas, through the second body of refractory material previously heated by the gaseous products from the low-grade fuel, whereby the hydrocarbon is converted into fixed illuminating-gas.

3. A cupola gas-generator having a fuel-chamber and a fixing-chamber, both in one structure, as described, the walls of the fuel-chamber being constructed to flare from below upward and outward and project at the top circumferentially outward beyond the base of the fixing-chamber, and said projecting portion having one or more openings passing downward through its top and in line with the flaring walls, through which openings the fuel-chamber may be evenly charged with fuel and the clinker readily cleaned from the walls, and said openings being provided with tight-fitting lids, as described.

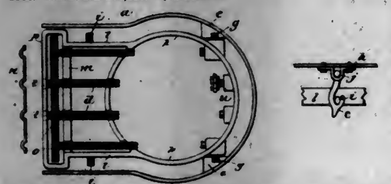
411,390. PULLEY-MOLDING MACHINE. JAMES C. MCDERMOTT, Chicago, Ill. Filed Aug. 3, 1888. Serial No. 282,260. (No model.)

Claim.—1. The combination, with the flask D, cover F, and rim-pattern *a*, of the vertically-movable plate *c*, sleeve G, post *g*, having a slot *h* therein, vertically-moving shaft *j*, eccentric-gears J on the ends thereof, shaft K, and eccentric-gears *k* thereon engaging with said eccentrics J, as set forth.

2. The combination, with the flask D and cover F, of the plate *c*, sleeve G, having a basal flange G', post *g*, having a slot *h* therein, vertically-moving shaft I, eccentric-gears J on the ends thereof, shaft K, eccentric-gears *k* thereon, which engage gears J, and lever *m*, suitably fulcrumed about midway its length and having its inner end bifurcated so as to support said sleeve on either side of said post *g*, as set forth.

3. The combination, with the flask and cover F, of the vertically-movable rim-pattern *a*, arm-pattern *e*, and boss-pattern E, plate *c*,

annulus *b*, sleeve G, arms H, connected to and projecting from the lower end of sleeve G, and supporting the annulus *b* on their upper ends, and post *g*, as set forth.



4. The combination, with the circular frame B, the ring C, flask D, and cover F, of the annulus *b*, vertically-movable rim-pattern *a*, plate *c*, sleeve G, arms H, and post *g*, as set forth.

5. The combination, with the flask D and cover F, of plate *c*, sleeve G, post *g*, having a vertical slot *h* therein, vertically-movable transverse shaft I, eccentric-gears J on the ends thereof, shaft K, eccentric-gears *k* thereon, which engage with gears J, gear K' on the forward end of shaft K, idle-gears L L', drive-shaft M, loose pinion N, and clutch on said drive-shaft, which engages the counterpart made integral with the boss of pinion N, as set forth.

6. The combination, with flask D, cover F, and the plate *c*, and sleeve G and post *g* supporting the same, of the vertically-movable rim-pattern *a*, sleeve P, supporting the rim-pattern by means of arms projecting therefrom, racks *r*, secured longitudinally to sleeve P diametrically opposite each other, pinions R, engaging said racks, and shafts *s*, as set forth.

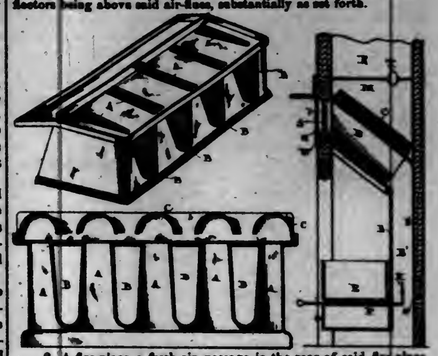
7. The combination, with flask D, cover F, plate *c*, annulus *b*, sleeve G, and post *g*, of the vertically-movable rim-pattern *a*, sleeve P, supporting said rim-pattern, racks *r*, secured longitudinally to the sleeve P, pinions R, shafts *s*, combined cog and friction gears S on the forward ends of shafts *s*, the frictional portions of which are arranged to engage with friction-pinion V, drive-shaft M, eccentric journal *v* therefor, and handle *y*, for operating the same so as to throw said friction-pinion alternately into engagement with first the friction-surface of one gear S and then the other.

411,891. GRATE. WILLIAM J. OWENS, Utica, N. Y. Filed May 8, 1888. Serial No. 273,259. (No model.)

Claim.—1. In combination with a furnace-base, a grate suitably supported at its rear end and having a lug *i* on each side of its front portion, and a rocking bar *j*, having hangers *c c* to receive and support the lugs *i*, substantially as described.

2. In combination with a furnace-base having saddles *c c* at its rear, a grate having trunnions *g* to fit said saddles and lugs *i* on each side of its front portion, and a rocking bar *j*, having hangers *c c* to receive and support the lugs *i*, substantially as described.

411,892. ADVERTISING DEVICE OR COIN-PROTECTOR. EDWIN W. PARKER, Waltham, Mass., assignor of one-half to the Hosantum Worsted Company, of Massachusetts. Filed Mar. 27, 1889. Serial No. 304,949. (No model.)

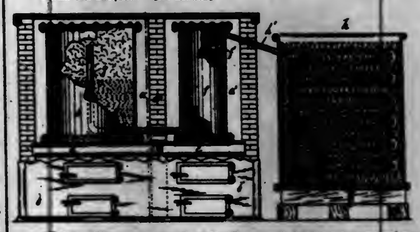


Claim.—1. An advertising device consisting of a coin *a*, a shield *b*, bearing on its face letters indicating the goods advertised, formed with a central perforation b^2, and an annular lip b', seated on the coin, and a sample of goods interposed between the coin and the perforated part of the shield, substantially as described.

2. An advertising device consisting of a coin *a*, a shield *b*, bearing on its face letters indicating the goods advertised, formed with a central perforation b^2 and an annular lip b', seated on the coin, a transparent diaphragm *d*, covering the perforation in the shield, and the sample *c* of goods interposed between the coin and the transparent diaphragm and visible therethrough, substantially as described.

411,893. VENTILATING FIRE-PLACE AND OPEN GRATE. HOMER P. K. PEET, Rye, assignor to William H. Jackson & Co., New York, N. Y. Filed Oct. 22, 1888. Serial No. 288,515. (No model.)

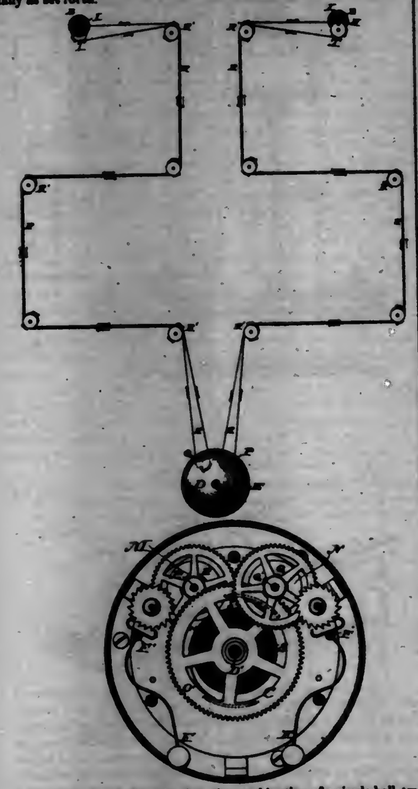
Claim.—1. A fire-place and a fresh-air passage in the rear of said fire-place and in operative contact therewith, in combination with a series of alternated smoke and fresh-air flues, said fresh-air flues establishing communication between said fresh-air passage and the apartment and said smoke-flues establishing communication between said fire-place and the chimney, and a series of deflecting-hoods above and parallel with said smoke-flues, the spaces between said deflectors being above said air-flues, substantially as set forth.



2. A fire-place, a fresh-air passage in the rear of said fire-place and in operative contact therewith, and a series of alternated smoke and fresh-air flues, said fresh-air flues establishing communication between said fresh-air passage and the apartment and said smoke-flues establishing communication between said fire-place and the chimney, in combination with a series of vertically-adjustable deflecting-hoods above and parallel with said smoke-flues, the spaces between said deflectors being above said air-flues, substantially as set forth.

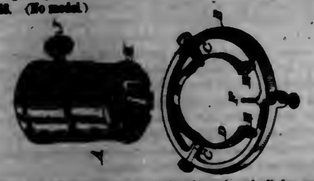
3. A fire-place, a fresh-air passage in the rear thereof and in operative contact therewith, a hot-air chamber above said fire-place and in direct communication with the apartment, flues connecting said fresh-air passage and said hot-air chamber, and an open liquid-holding reservoir within said hot-air chamber, in combination with a screen or diaphragm extending across said hot-air chamber and in operative contact with the liquid in said liquid-reservoir, substantially as set forth, whereby the air heated by said fire-place must pass through said screen before entering the apartment.

4. A fire-place provided with projecting lips or ledges, a fresh-air passage in the rear of said fire-place and in operative contact therewith, and a series of alternated smoke and fresh-air flues, said fresh-air flues establishing communication between said fresh-air passage and the apartment and said smoke-flues establishing communication between said fire-place and the chimney, in combination with a series of vertically-adjustable inverted trough-shaped deflecting-hoods above and parallel with said smoke-flues, the spaces between said deflectors being above said air-flues, vertical plates to which said hoods are secured, and adjusting rods or pendants supporting said vertical plates, said rods or pendants having notches co-acting with said lips or ledges on the fire-place, substantially as set forth.



411,894. APPARATUS FOR DISTILLING CRUDE PETROLEUM. WILLIAM H. PITT, Buffalo, N. Y., assignor, by direct and mesne assignments, to the Apex Refining Company, same place. Filed Jan. 27, 1888. Serial No. 262,120. (No model.)

Claim.—The apparatus for distilling and deodorizing petroleum having sulphurous or other offensive odors, said apparatus consisting of a furnace with two fire-places, a retort over one fire-place and a deodorizing receptacle over the other fire-place, and a pipe opening into the upper part of the retort and passing down through the retort and out near the bottom of the latter to the said receptacle, which has a discharge-outlet for the deodorized vapors, all substantially as described.



411,895. DOOR-BELL MECHANISM. ALBERT F. ROCKWELL, Bristol, Conn., assignor, by mesne assignments, to the New Departure Bell Company, same place. Filed Feb. 7, 1889. Serial No. 299,020. (No model.)

Claim.—1. In a door-bell mechanism, the combination of a push-button, a push-rod to which the button is attached, a brake connected with the inner end of the push-rod and adapted to be operated by it, a brake-pulley upon which the brake acts, an alarm mechanism provided with a pulley, and an endless band working on the said pulley and on the brake-pulley, whereby a push upon the push-button will cause the ringing of a bell as long as it is continued and no longer, substantially as set forth.

2. In a door-bell mechanism, the combination of a single bell, two alarm mechanisms adapted to independently ring the bell, and a main-spring having one end connected to and adapted to operate one alarm mechanism, and the other end connected to and adapted to operate the other alarm mechanism, whereby the same bell may be rung by different movements operated by the same power, substantially as set forth.

411,896. HOLDER FOR ELECTRIC-LIGHT SHADES. HARRY H. SAWYER, Ridley Park, assignor of one-half to the Tuckers Manufacturing Company, Philadelphia, Pa. Filed June 27, 1888. Serial No. 316,749. (No model.)

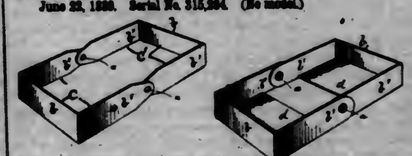
Claim.—1. A holder for the shade of an electric light, consisting of a shade-holding ring, arms connected therewith, a clamping-band having eyes and attached to said arms, and an ear on the ring with which the eyes of said band are removably connected, substantially as described.

2. A holder for the shade of an electric light, consisting of a shade-ring, arms, and an ear projecting inwardly therefrom, a distensible band connected with said arms and provided with ears, and a screw which is passed through said ear and eyes, substantially as described.

411,897. DRYING OR EVAPORATING APPARATUS. JOSEPH B. SHANAN, South Lynne, Ill. Filed Nov. 30, 1888. Serial No. 292,169. (No model.)

Claim.—1. The combination of a close annular casing, an annular evaporating-pan placed within the same and provided with a depending flange, and a second annular pan containing liquid in which said flange and the inner casing are immersed, whereby said liquid acts both as condenser and a water seal.

2. In an evaporating apparatus, the combination, with a horizontal rock-shaft having one of its ends projected outside the casing and bearing on said end a crank-arm whereby to rock it, of a set of stirrers comprising arms bearing shovels at one end and sleeves at the other, through which sleeves the rock-shaft passes, and a rod supported on arms rigidly attached to and depending from said rock-shaft and parallel thereto, and against which the stirrer-arms have a bearing, and by means of which their position is fixed, substantially as described.



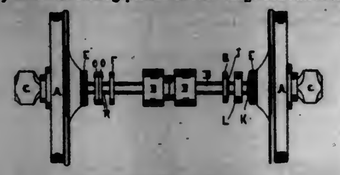
3. The combination of an annular evaporating-pan provided on its inner periphery with a depending flange 39, with a casing about said pan, a cylinder 28, and a second pan containing liquid in which said flange and the lower edge of said cylinder are immersed, whereby a water seal is provided, and gearing, substantially as described, for rotating said evaporating-pan.

4. The combination of the flue 1, a furnace 3, and passage-way 2, said passage-way being horizontally elongated where it connects with the furnace and vertically elongated where it connects with the flue, substantially as set forth.

5. The combination, with the flue 1, of the set of radially-arranged furnaces 3 and passages 2, said passages being of the same capacity throughout, but horizontally elongated where they connect with the furnaces and vertically elongated where they connect with the flue, substantially as and for the purpose set forth.

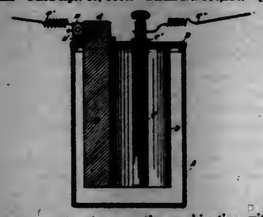
6. In combination with a furnace and central flue, an annular revolving evaporating-pan incased, an inner annular liquid-bearing condensing-chamber, and the partially-submerged flange and cylinder, substantially as described and shown.

411,898. PAPER BOX. PHILO C. BURNS, New York, N. Y. Filed June 22, 1889. Serial No. 315,294. (No model.)



Claim.—1. In a box, the combination of an inclosing-case open at one or both ends and a sliding frame or rim composed of two or more sections having their ends pivoted together, the rim or frame being bottomless in the line of the pivots.

2. The combination of the outer case A, open at one or both ends, and the sliding frame or rim C, composed of two or more sections, each of which is provided with a separate bottom shorter than itself.



411,899. THRUST-RECEIVING PLATE FOR CAR-WHEELS. SAMUEL W. TANNER, Chicago, Ill., assignor to the Tanner Anti-Friction Wheel Company, same place. Filed Jan. 5, 1889. Serial No. 295,595. (No model.)

Claim.—The combination of a car-axle with fixed flanges thereon, being outwardly convex, with wheels on the ends of such axles, having each an inwardly-convex portion, and two anti-friction devices on the axle, one between each of such wheels and flanges, said anti-friction devices being concave on both sides and loose on the axle, and provided with radially-journaled friction-rollers in the shape of trun-

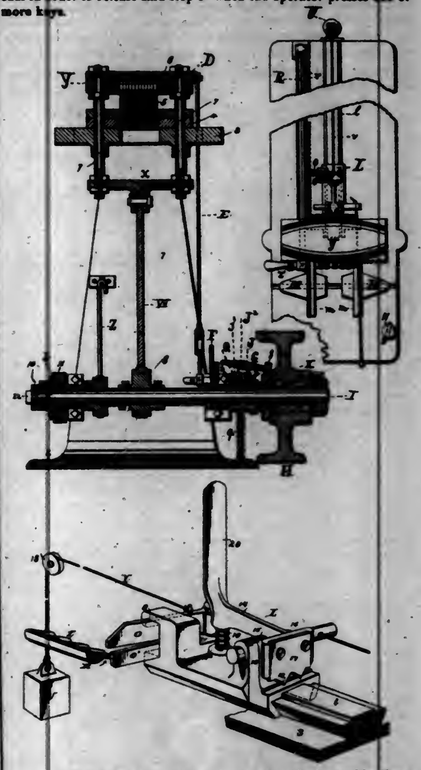
cated cones projecting from the sides of such anti-friction devices, and dust-caps adapted to reciprocate on such axle, and when in position to entirely cover the bearing portion of such flange and anti-friction devices.

411,400. GALVANIC BATTERY. WILLIAM C. THOMPSON, Minneapolis, Minn. Filed Apr. 15, 1889. Serial No. 307,267. (No model.)

Claim.—1. In a carbon battery, the combination, with a removable glass cover having a perforation, of a body of carbon provided with a pole-piece extending outward through said perforation, an elastic packing fitting over said pole-piece and resting on the cover, and an annular metallic contact-clamp over said pole-piece above said packing, substantially as described.

2. In a carbon battery, the combination, with the removable glass cover B, provided with a perforation, of the body of carbon D, provided with the pole-piece *d*, extending outward through the perforation of the cover, the elastic packing D', the metal band E, clamping-screw *d'*, and thumb-nut *e*, substantially as described.

3. In a carbon cell, the combination, with a removable cover, of a body of carbon crescent-shaped in cross-section and provided with a pole-piece or projection extending through a perforation in the cover, a metallic contact-clamp attached to said pole-piece, and an elastic packing between said contact-clamp and cover, substantially as described.



411,401. CARD-STAMPING MACHINE FOR JACQUARD MACHINES. WILLIAM P. UHLINGER, Philadelphia, Pa. Filed Feb. 1, 1887. Serial No. 226,152. (No model.)

Claim.—1. In a machine for stamping Jacquard cards, the combination, substantially as hereinbefore set forth, of a stamping-head, keys in said head, punches controlled by said keys, an intermittingly-operated shaft connected to said head to reciprocate the same, a driving-wheel running normally idle on said shaft, a clutch interposed between the wheel and the shaft, and connecting mechanism between said clutch and the keys, whereby the operation of any one of the keys causes the wheel to engage with and revolve the shaft.

2. In a machine for stamping Jacquard cards, in combination, keys, a projection upon each of said keys, a shaft, a plate attached to said shaft, segmental gearing at the end of said shaft, a driving-wheel, a shaft upon which said driving-wheel normally runs idle, a clutch upon said shaft, and intermediate mechanism, substantially as described, between said clutch and segmental gearing, whereby, when the operator presses one or more keys, the clutch is caused to engage the driving-wheel and revolve with it, substantially as and for the purpose described.

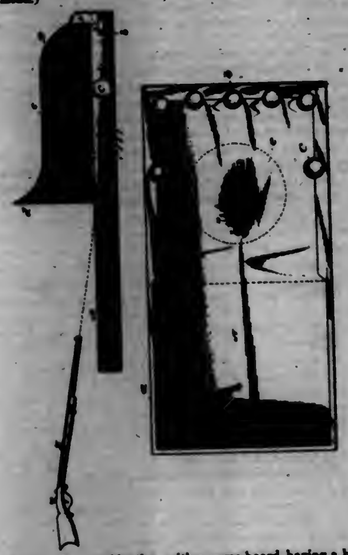
3. In a machine for stamping Jacquard cards, in combination, keys A, shaft C, a plate upon said shaft, segmental gearing D and D', rod E, flexible step F, driving-wheel H, normally running idle on shaft I, cam K upon said wheel, rocking trip G, having roller *g*, clutch-holder Q, having cam J, a plunger *p* upon said shaft I, a stop J^3 upon said plunger, and a connecting-rod connecting said shaft with the stamping-head, whereby, when the operator presses one or more keys, the clutch-holder is released from the stop J^3 and the plunger brought into engagement with the idle-wheel H and the stamping-head automatically caused to reciprocate.

4. In a machine for stamping Jacquard cards, in combination, keys, a flexible step, intermediate mechanism, substantially as described, connecting said keys and said flexible step, a clutch-holder, a driving-wheel, a shaft upon which said driving-wheel revolves, a cam upon said wheel, plunger *p*, a stop J^3, and a rocking trip, the path of movement of one end of which is in the path of the flexible step when a key is pressed, the other end having a wheel which revolves on the cam, whereby said rocking trip is on the highest throw of the cam in order to release said stop J^3 when the operator presses one or more keys.

5. In a machine for stamping Jacquard cards, in combination, a shaft, a driving-wheel which normally runs idle upon said shaft, a stamping-head provided with keys and connected to the shaft, a clutch upon said shaft, means, substantially as described, operated from the keys to cause said clutch to engage said driving-wheel, and a brake, substantially as described, at the other end of said shaft, whereby, when the clutch is disengaged from said driving-wheel, the inertia gained by said shaft is overcome by said friction device.

6. In a machine for stamping Jacquard cards, in combination, the stamping-head and its operating devices, substantially as described, a rocking shaft, teeth upon said shaft, escapement-fingers, one of which rests between the teeth of said rocking shaft, a card-head and means to cause said head to move when the said escapement-finger is released from between the teeth of the rocking shaft, substantially as set forth, and mechanism to rock said shaft, whereby, when said shaft is rocked, said escapement-finger is released, substantially as and for the purpose described.

7. In a machine for stamping Jacquard cards, in combination, the stamping-head and its operating devices, substantially as described, a rocking shaft, teeth upon said shaft, a card-head, escapement-fingers, one of which is rigid, the other flexible and having a movement in a slot in the card-head, means, substantially as described, to rock said shaft, whereby the rigid escapement-finger is released from between the teeth of the rocking shaft and the flexible finger is engaged between the teeth of the shaft, and means, substantially as described, to move said head, whereby, when the shaft is rocked, the card-head travels, but said travel is limited to the extent of travel of the flexible escapement-finger in the slot of the card-head.

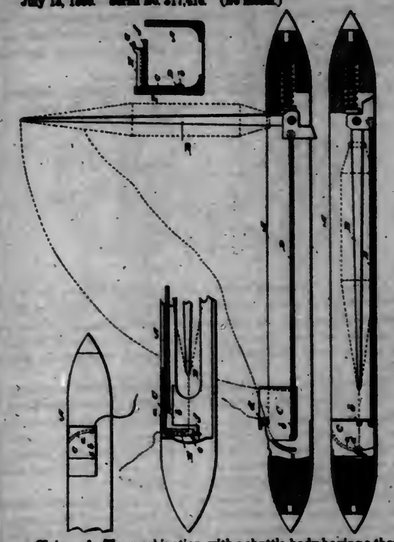


8. In a machine for stamping Jacquard cards, in combination, keys, a driving-wheel, a shaft upon which said driving-wheel normally runs idle, a clutch on said shaft, intermediate mechanism, substantially as described, to cause said clutch to operate and the shaft to revolve when a key is pressed, a connecting-rod upon said shaft, a rocking shaft connected with said connecting-rod, teeth upon said rocking shaft, a card-head, and escapement-fingers, one of which rests between the teeth of said rocking shaft, whereby, when the operator presses a key, one of the escapement-fingers is released from and the other engaged with said teeth of said rocking shaft.

9. In a machine for stamping Jacquard cards, in combination, a stamping-head, keys, punches corresponding to each of said keys, a driving-wheel, a shaft upon which said driving-wheel normally runs idle, a clutch upon said shaft, intermediate mechanism, substantially as described, to operate said clutch and cause the shaft to rotate, a connecting-rod connecting said shaft and the stamping-head, a rocking shaft, an eccentric on said driving-shaft, and a connecting-rod between said rocking shaft and the eccentric on said driving-shaft, teeth upon said rocking shaft, escapement-fingers, one rigid and the other flexible, the rigid finger normally resting between the teeth of said rocking shaft and a card-head, and means, substantially as described, to cause said card-head to move, whereby, when the operator presses keys, the stamping-head is automatically reciprocated and the desired hole or holes cut and the card-head caused to travel a fixed distance.

10. In a machine for stamping Jacquard cards, in combination, two or more keys, all but one of said keys having plungers corresponding to said keys, a driving-wheel, a shaft upon which said driving-wheel normally runs idle, a clutch upon said shaft, intermediate mechanism, substantially as described, to operate said clutch and cause the shaft to rotate, a connecting-rod connecting said shaft and the stamping-head, a rocking shaft, a corresponding rod between said shaft and the driving-shaft, teeth upon said rocking shaft, a card-head, escapement-fingers O and O', and means, substantially as described, to cause said card-head to move, whereby, when the operator presses the key having no corresponding plunger, the card is moved and the stamping-head reciprocated without punching any hole on the card.

11. In a machine for stamping Jacquard cards, in combination, the slides *m*, a spring connecting said slides, wings M M, a stop N, working in the slot *n'*, and intermediate mechanism, substantially as described, connecting said stop and the wings M, whereby a movement of the stop causes a varying distance between the slides *m*.

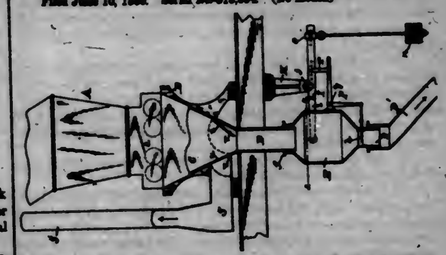


411,402. GAME APPARATUS. MAXIME VIBOUDE, Woonsocket, R. I., assignor of three-fourths to Louis Lemonde, Jeinangie Boutin, and Ferdinand Crepeau, same place. Filed May 28, 1889. Serial No. 312,406. (No model.)

Claim.—1. The combination, with a game-board having a bank and side pockets, of a guard composed of wire-work arranged over the board and above the pockets therein, and also having a central opening in its roof, substantially as and for the purpose specified.

2. The combination, with a game-board having a vertical marginal guard-wall, and a guard arranged across the table and above the pockets and recesses therein, the said guard having an opening in its roof to permit of the introduction of the arm to the board, substantially as specified.

411,403. SELF-THREADING SHUTTLE FOR LOOMS. MAXIME VIBOUDE, Woonsocket, R. I., assignor of three-fourths to Elmer C. Gaggan, Ferdinand Crepeau, and Raoul T. L'Esperance, same place. Filed July 13, 1889. Serial No. 317,616. (No model.)



Claim.—1. The combination, with a shuttle-body having a thread-receiving slot in one of its forward side walls, of a threading-plate having a threading-loop and pivoted in the shuttle, the spindle, and a rod connecting the threading-plate with the spindle, whereby the movements of the spindle will turn the plate on its pivot, substantially as specified.

2. The combination, with a shuttle-body having a curvilinear slot in one of its forward side walls, of the spindle and a plate provided with a threading-loop and pivoted in the shuttle so as to conduct the thread in the slot of the shuttle, said plate being connected with the spindle, whereby the movements of the latter will operate the threading-plate, substantially as specified.

3. The combination, with a shuttle-body having a thread-receiving slot in one of its side walls, of a threading-plate having an inwardly-directed branch provided with a thread-passage and also provided with means for guiding the thread, a pivoted spindle, and a rod connecting the plate with the spindle, substantially as specified.

4. The combination, with a shuttle-body having a thread-receiving slot in one of its side walls, of a pivoted plate having a thread-receiving eye arranged with respect to the pivotal point so that when the latter has been turned forwardly it will conduct the thread into the slot of the shuttle-body, substantially as specified.

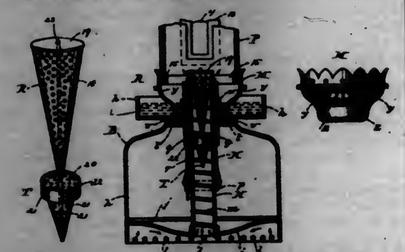
411,404. SAFETY DEVICE FOR GRAIN-MILLS. LOUIS WAGNER, Baltimore, Md., assignor of one-half to John Herr, same place. Filed June 10, 1889. Serial No. 313,694. (No model.)

Claim.—1. The combination, with the grain-mill, of a funnel, a ground-grain conduit D, and also a vent-flue B, leading from the fun-

nel, and two valves in the funnel, each mounted on a rock-shaft, one closing connection with the conduit and the other closing connection with the vent-flue, and a connection between said two valves whereby one is opened when the other closes.

2. The combination, with a grain-mill, of a funnel, a ground-grain conduit D, and also a vent-flue S, leading from the funnel, a valve closing connection with the conduit, a valve closing connection with the vent-flue, and said valves mounted on separate rock-shafts provided with arms, and a rod connecting the arms, whereby when one valve opens the other valve will close.

411,405. HORSESHOE-ANVIL. LEVI R. WESCOTT, Cumberland Mills, Me. Filed Apr. 13, 1889. Serial No. 307,126. (No model.)



Claim.—1. The combination, with a suitable support and a removable swage seated in the top of the support, of a vibrating lever pivoted to the support, the upper end of the lever being in position to abut against the removable swage, and a foot-lever pivoted to the support and connected with the said vibrating lever, substantially as set forth.

2. In combination, a suitable support, a lever pivoted in said support and provided with a horizontal arm and with an upwardly-extending arm, a swage removably seated in the top of the support, the upper end of the swage being horizontally opposite the upper end of the upwardly-turned arm of the lever, a foot-lever pivoted to the support, and a connection between the foot-lever and the horizontal end of the first-named lever, substantially as set forth.

3. In combination, a suitable support, a swage removably seated in its head, a lever pivoted to the support and provided with an upwardly-extending gripping-arm, a foot-lever pivoted to the support, an intermediate lever pivoted to the support, connections between the intermediate lever and the gripping and foot levers, and a spring for holding the gripping-lever in released adjustment, substantially as set forth.

411,406. OIL-STOVE. AUGUSTUS C. WEST, Cambridge, assignor to the Smith & Anthony Stove Company, Boston, Mass. Filed Mar. 26, 1889. Serial No. 304,662. (No model.)

Claim.—1. In a lamp for oil-stoves, provided with a water-cup, a hollow chimney-holder fitted to slide on the wick-sleeve and rest in the water-cup, said holder being perforated at or near its bottom and also above the water-line of said cup, substantially as and for the purpose set forth.

2. In a lamp for oil-stoves of the character described, the combination of a water-cup attached to the wick-sleeve, with a hollow chimney-holder provided with a groove for supporting the chimney, said holder being fitted to slide on said sleeve and perforated at or near its bottom to admit water from said cup, substantially as and for the purpose set forth.

3. The chimney-holder M, provided with the groove 15 and perforations y z, substantially as described.

4. In an oil-stove of the character described, a hollow cone having perforated walls and a solid base, and adapted to be detachably disposed in the wick-tube of the lamp in such manner that its base will project above the mouth of said tube and distend the flame, substantially as described.

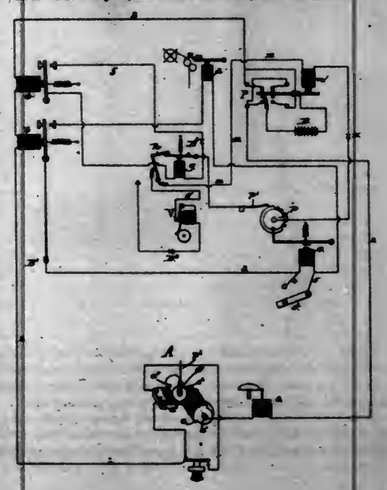
5. In an oil-stove of the character described, a lamp-body provided with a wick-tube open at both ends, in combination with two hollow perforated cones joined together and inserted in an inverted position in said tube in such manner that the base of the larger cone projects above the top of said tube, substantially and for the purpose specified.

6. The hollow cone R, having the perforations 18 and solid base 19, in combination with the hollow perforated cone T, secured to the apex of the cone R, and provided with the guide-ring 22, substantially as and for the purpose set forth.

7. In an oil-stove, the combination of a lamp-body having air-openings below its bottom, a spirally-threaded wick-tube secured in said bottom and open at both ends, a nut fitted to travel on said tube, a wick-sleeve, a rod secured to said sleeve and sliding in said nut, a water-cup fitted to revolve in the mouth of said body and secured to said sleeve, and a hollow chimney-holder fitted to slide on said sleeve, said holder being perforated above the water-line of the cup and at or near its bottom, substantially as and for the purpose set forth.

8. In a lamp for oil-stoves, provided with an open spiral wick-tube, the combination of a wick-nut on said tube, a wick-sleeve rotating the wick-nut, a water-cup secured to said sleeve, two connected hollow perforated cones disposed in said wick-tube, the base of the larger cone being above the mouth of said tube, and a hollow chimney-holder fitted to slide on said sleeve, said holder being perforated above and below the water-line of said cup, substantially as and for the purpose set forth.

9. In an oil-stove, the combination of a frame provided with a lamp-stand, a top supported on said frame and provided with stove-openings, a hot-air chamber secured to said top and provided with openings for the lamp-chimneys, and flat rings for closing said openings around said chimneys, substantially as described.



10. In an oil-stove, a lamp comprising a body having air-holes below its bottom, a spiral wick-tube opening through said bottom, a wick-nut on said tube, a wick-sleeve provided with a rod working vertically in said nut, a water-cup secured to said sleeve, inverted perforated cones or air-distributers inserted in said tube, the base of the larger cone being solid and extending above the mouth thereof, a chimney-holder fitted to slide on said tube and perforated above and below the water-line of said cup, and a chimney provided with a door, all being arranged to operate substantially as described.

11. The hollow cones R T, connected by the stiffening-rod 23, and respectively provided with the perforations 18 and 21, base-plate 19, and guide-ring 22, substantially as described.

12. In an oil-stove, the frame A, provided with the stand *d* and top *f*, having the stove-openings *g*, in combination with the chamber E, secured to said top and provided with chimney-openings 25, the lamps B C D, provided with chimneys 16, and the disks 26, for closing said openings around said chimneys, substantially as described.

13. In an oil-stove, the combination of a frame provided with a hot-air chamber having chimney-openings, lamps provided with chimneys projecting through said openings, and caps, as 27, for closing the chimneys of lamps not in use, whereby cold air is prevented from entering said chamber, substantially as described.

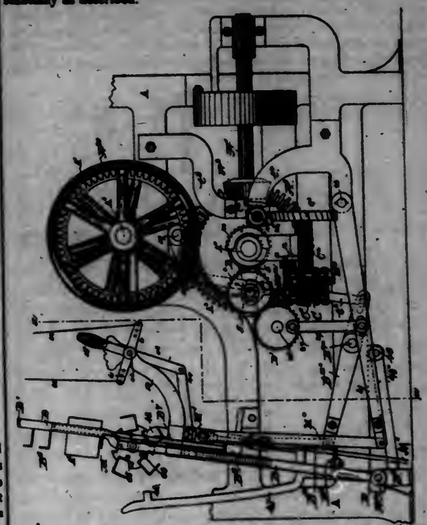
411,407. MUNICIPAL SIGNAL APPARATUS. JOHN C. WILSON, Boston, Mass., assignor to the Municipal Signal Company, Portsmouth, N. H. Filed July 13, 1888. Serial No. 207,894. (No model.)

Claim.—1. In an electric circuit, a signal-transmitting apparatus constructed and arranged to produce a series of changes in the circuit of long and short duration, and two relays connected in said circuit the armature of one of which is acted upon by a retarding force, thereby rendering it responsive only to the changes of long duration, and the armature of the other of which is unrestrained and thereby responsive to all changes in the circuit, substantially as described.

2. In an electric circuit, a signal-transmitting apparatus constructed and arranged to produce a series of changes in the circuit of long and short duration, and two relays connected in circuit, the armature of one of which is acted upon by a retarding force, thereby rendering it responsive only to changes of long duration, and the armature of the other of which is unrestrained and thereby responsive to all changes in the circuit, a receiving-instrument controlled by that relay having the unrestrained armature and which is responsive to all changes in the condition of the current, and an audible alarm controlled by that relay having the restrained armature, which is responsive only to changes of long duration, substantially as described.

3. In an electric circuit, a transmitting apparatus located at a sub-station and constructed and arranged to change the condition of the current for intervals of long and short duration, a relay located at a main station connected in said circuit and responsive only to changes of long duration in the condition of the current, an electro-magnet and drop controlled by it, a local circuit controlled by said drop, and return-signal-transmitting devices included in said local circuit, and another local circuit also controlled by said drop and containing an audible alarm, substantially as described.

4. In an electric circuit, a transmitting apparatus located at a sub-station and constructed and arranged to change the condition of the current for intervals of long and short duration, two relays located at a main station and connected with said circuit, one of said relays being responsive to all changes in the condition of the current and the other responsive to changes of long duration only, a releasing-magnet under the control of the relay which is responsive to all changes in the condition of the current, and a return-signal transmitter controlled by it, and an electro-magnet and drop under the control of the relay responsive only to the changes of long duration, the said drop being included in circuit with the return-signal transmitter, an electro-magnet included in circuit with and responsive to the return-signal transmitter, and a pole-changer operated by said electro-magnet to thereby effect the transmission of the return-signal to the sub-station, substantially as described.



5. In an electric circuit, a signal-transmitting apparatus located at a sub-station and constructed and arranged to change the condition of the current for intervals of long and short duration, two relays located at the main station and connected with said circuit, one of said relays having its armature acted upon by a retarding force to thereby respond to the changes of long duration only, the other relay having its armature unrestrained to thereby respond to all changes in the circuit, a releasing-magnet under the control of the relay having the unrestrained armature, and a circuit-changing device for sending the return-signal released by the releasing-magnet, substantially as described.

6. In an electric circuit, the combination, substantially as described, of a signal-transmitting device at one station constructed and arranged to produce changes in the circuit of long and short duration, with two relays, the armature of one of which has a retarding or restraining force acting upon it, a register, and a return-signal transmitter controlled by the relay whose armature is not retarded or restrained, and an audible alarm and circuit-breaker controlled by the relay whose armature is retarded or restrained, said circuit-breaker, when operated, rendering the circuit containing the return-signal transmitter inoperative.

7. In a police-signal system, an electric circuit connecting a main and a sub station, a signal-transmitting apparatus at the sub-station constructed and arranged to produce changes in the condition of the current for intervals of long and short duration, a register located at the main station responsive to all such changes in the condition of the current, and a relay also located at the main station and connected in said circuit, the armature of which is acted upon by a retarding or restraining force, rendering it responsive only to changes of long duration in the condition of the current, and an audible alarm or indicating signal also located at the said main station controlled by said retarded or restrained armature, substantially as described.

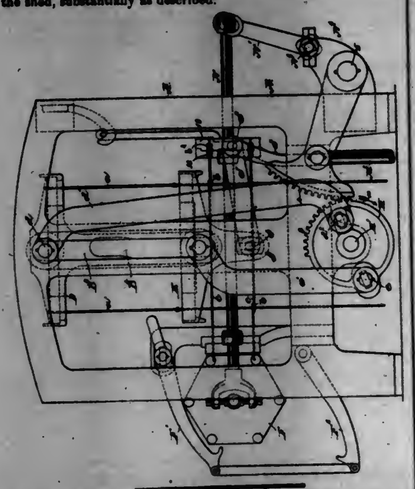
411,408. SHUTTLE-BOX MECHANISM FOR LOOMS. HORACE WYMAN, Worcester, Mass., assignor to the Crompton Loom Works, same place. Filed Feb. 14, 1889. Serial No. 299,570. (No model.)

Claim.—1. A loom containing the following instrumentalities, viz: a series of drop shuttle-boxes, means to move them, a series of rotatable shuttle-boxes, an independent frame on which the rotatable shuttle-boxes are mounted, a guide for the said frame and the drop shuttle-boxes in their movement, and means to move the frame of the rotatable shuttle-boxes independently of the drop shuttle-boxes, substantially as described.

2. The two series of rotary shuttle-boxes, frames carrying them, two levers, connections between them and the said frames, two cranks, means to connect them with the said levers, and means to rotate the said cranks, combined with two series of drop shuttle-boxes, means to actuate them, and guides for the said frame and drop shuttle-boxes, substantially as described.

3. The two series of rotary shuttle-boxes, frames carrying them, two levers, connections between them and the said frames, a cross-shaft, cranks at each end thereof, connections between said cranks and levers, guides for the said frames, and means to rotate the said rotary boxes, combined with a gear on the said shaft, a pattern-surface, a clutch-gear, means to rotate it, and means between the clutch-gear and the said pattern-surface to move the clutch-gear laterally and cause the said cross-shaft to be rotated intermittingly, substantially as described.

4. The series of rotary boxes, means to rotate them, and the series of drop shuttle-boxes, the guides for the drop-boxes, and the drop-box levers, and means to operate them and the box-rods, combined with links between the said levers and box-rods, the said links being constructed to enable their effective length to be varied, substantially as described.



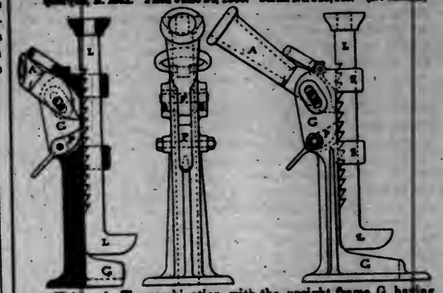
5. A series of drop shuttle-boxes, a series of rotating shuttle-boxes, a vertically-movable frame in which the rotating shuttle-boxes are mounted to rotate, guides for the said drop shuttle-boxes and the said frame, levers, and connections between them and the said drop shuttle-boxes and the said frame, and means to actuate the said levers to raise and lower the said shuttle-boxes, combined with independent pattern-surfaces to control the order of movement of the means employed to actuate the said levers, whereby the drop-boxes and the rotary boxes may be moved vertically independently of each other, or the drop-boxes be moved vertically while the rotary boxes are out of operative position, substantially as described.

6. Two series of rotary shuttle-boxes, frames carrying them, guides for the said frames, two levers, and connections between them and the said guide-frames, combined with a cross-shaft, means to actuate it, connections between it and the said levers, and pattern mechanism, and means between it and the said cross-shaft to control the actuation of the latter, substantially as described.

411,409. JACQUARD MECHANISM FOR LOOMS. HORACE WYMAN, Worcester, Mass., assignor to the Crompton Loom Works, same place. Filed Mar. 9, 1889. Serial No. 302,995. (No model.)

Claim.—1. The combination, with the top board and trap-board and rocking plates having crank-pins, of connecting-rods extended from the said crank-pins to the said boards, and with means to actuate the rocking plates, whereby a substantial dwell may be given to the said boards when the shed is fully opened for the passage of the shuttle, substantially as described.

2. The combination, with the top board and trap-board and rocking plates having crank-pins, of connecting-rods extended from the said crank-pins to the said boards, and with means to actuate the rocking plates, whereby a substantial dwell may be given to the said boards when the shed is fully opened for the passage of the shuttle, and with means for rocking the said top board and trap-board to give a < shape to the shed, substantially as described.



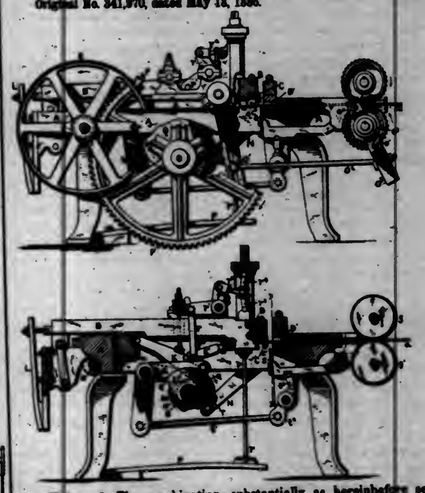
411,410. LOOM FOR WEAVING TUFTED FABRICS. HORACE WYMAN and JONATHAN G. GALE, Worcester, Mass., assignors to the Crompton Loom Works, same place. Filed Apr. 19, 1889. Serial No. 307,531. (No model.)

Claim.—1. The combination, with the supporting-bars and the carriages guided by the said bars and provided with a series of pockets, of the tuft-yarn carriers in the said pockets, substantially as described.

2. The combination, with the supporting-bars, and the carriages mounted thereon and provided with the pockets *a'*, of tuft-yarn carriers inserted in the said pockets.

3. The combination, with the pivoted frame and supporting-bars, of the carriages having convexed under sides, and provided with the pockets, substantially as and for the purpose described.

411,411. RATCHET TRACK-JACK. THOMAS R. GAMBL, Albuquerque, N. Mex. Filed June 24, 1889. Serial No. 315,462. (No model.)



Claim.—1. The combination, with the upright frame G, having the loops or guides S projecting laterally therefrom, of the lifting-bar L, substantially as set forth.

2. The combination, with the upright frame having the slotted bearings for the lever, of the said lever engaging therewith and with the lifting-bar, and the pawl P, substantially as described.

REISSUES.

11,080. MACHINE FOR FORMING BOLT-BLANKS. WILLIAM R. WARD, Port Chester, N. Y. Filed July 11, 1889. Serial No. 317,941. Original No. 341,970, dated May 18, 1886.

Claim.—1. The combination, substantially as hereinbefore set forth, of mechanisms, substantially as described, for feeding forward at successive times the rod from which blanks are to be made, for gripping at successive times the rod after it has been fed, and for upsetting at successive times the end of the rod to form the head, such mechanisms being arranged as described, so that the said operations of feeding, gripping, and upsetting, respectively, shall follow each other in series, whereby a complete head can be progressively formed on the end of the rod, and cutting mechanism operating in front of the anvil-faces of the grippers to sever the blank from the rod after the rod with a full-formed bolt-head thereon has been fed forward.

2. The method, substantially as hereinbefore set forth, of forming bolt-blanks from cold rods of metal, which consists in a plurality of feedings, grippings, and upsettings upon the rod before severing, whereby the head of the blank is progressively formed, then advancing the rod a distance sufficient to expose enough of its length for a complete blank, and then severing the blank from the rod by cutting devices operating in front of the anvil-faces of the gripping-jaws.

DECISIONS
OF THE
COMMISSIONER OF PATENTS
AND OF
UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court—District of Connecticut.

GUARANTEE TRUST & SAFE DEPOSIT COMPANY *et al. v.* NEW HAVEN GAS-LIGHT COMPANY.

Decided July 8, 1889.

LOWE—PROCESS AND APPARATUS FOR THE MANUFACTURE OF ILLUMINATING OR HEATING GAS.

Letters Patent No. 167,847, issued September 21, 1875, to Thaddeus S. C. Lowe, for an improved process and apparatus for the manufacture of illuminating or heating gas, contain a process for the manufacture of water-gas containing but little nitrogen. The presence of nitrogen in illuminating-gas is deleterious, and when it amounts to 9 per cent. or more it amounts to a serious fault. The feature of the process consists in producing the gas in a close chamber—that is, one from which the air is excluded—or by an alternating, as distinguished from a continuous, process. All of the essential apparatus was old, except the fixing-chamber, which is so arranged as to be heated internally by the products of combustion that escape from the generator and envelop the refractory material. *Held* that as the invention introduced a very desirable advantage into the process of making illuminating-gas by which the expense is greatly lessened, the facts that the older inventions which are now claimed to be susceptible of being modified by mere mechanical skill into the one in question remained without modification until the patentee made it, and that his improvement at once commended itself to those skilled in the art, are sufficient to show patentable invention.

BILL FOR infringement of Letters Patent.

Mr. B. F. Thurston and *Mr. E. N. Dickerson, Jr.*, for the complainants.

Mr. John R. Bennett for the defendant.

WALLACE, *J.*:

This suit is founded upon the patent granted to Thaddeus S. C. Lowe, No. 167,847, dated September 21, 1875, for improvement in processes and apparatus for the manufacture of illuminating or heating gas. The complainants allege infringement by the defendant of the first claim of the patent. That claim is as follows:

1. For the manufacture of illuminating and heating gas, the process which consists of dropping or otherwise admitting in limited quantities, continuously or intermittently, hydrocarbon oils or other carbonaceous substances, liquid or solid, onto the top of a thick mass of coal or other carbonaceous substance, in a state of incandescence, in a close chamber previously heated by direct internal combustion, with or without the introduction of steam, and then, for the purpose of superheating and fixing the gases of said chamber, passing them from said chamber into and through a second chamber, which also has been previously heated by direct internal combustion, substantially as set forth.

This claim includes two inventions, each of which is a process in the sense that it involves the treatment of materials by successive steps conducted by means of a combination of devices. Each process involves the use of apparatus which consists, essentially, of a cupola or generator, a superheater or fixing-chamber having specified characteristics, and certain pipe-connections for introducing air or air and steam into the generator and carrying the gases generated there to the superheater. The superheater is filled with refractory material—such as loosely-laid fire-brick—and is heated by the hot gases which are produced in the generator. One process of the claim, and the process which, it is alleged, is employed by the defendant, is for the manufacture of water-gas. This is an intermittent process. In this process anthracite or bituminous coal or other solid carbonaceous substances are introduced into the generator and brought to a high state of incandescence by the passage through it of a current of air. The products of combustion which are there generated pass down through a pipe underneath the fixing-chamber and then proceed upward through the fixing-chamber, enveloping the refractory material therein by the aid of an air-supply introduced at its base. When the carbonaceous matter in the generator has reached a high state of incandescence, the currents of air are discontinued both at the generator and the fixing-chamber, and steam is introduced at the base of the generator. The steam, acting upon the incandescent carbon, is decomposed, and a gas composed of hydrogen and carbonic oxide is evolved. At the upper part of the generator, or anywhere on the passage of this gas to the fixing-chamber, a liquid hydrocarbon is introduced into it, and, becoming volatilized, passes with the other gaseous vapors through the pipe into the fixing-chamber, where they are converted into permanent gas. After a time the action of the steam upon the incandescent carbon in the cupola will have so lowered the temperature that the manufacture of gas cannot be successfully continued, and it becomes necessary to discontinue the current of steam and to renew the supply of air in order to again bring the carbon in the cupola to a high state of incandescence and heat up the contents of the fixing-chamber. The gas made by this process consists of hydrogen, carbonic oxide, and a variety of hydrocarbon gases, and contains but little nitrogen. The presence of nitrogen in illuminating-gas is deleterious, and when it reaches the extent of 9 per cent. becomes so objectionable as to be a serious fault. The feature of the process, therefore, which consists in producing the gas in a close chamber—that is, one from which the air is excluded—or by an alternating, as distinguished from a continuous, process, is of controlling importance. The second process of the claim is one for producing an oil-gas. This process differs from the other in that no steam is introduced into the generator. This process is included in the claim because the claim contains the words "with or without the

introduction of steam." This language has no sensible meaning unless it is intended to embody a process in the claim which is referred to in the specification, as follows:

> In cases where gas extremely rich in carbon is desired, the same will be best produced by omitting the steam and generating the gas from oils alone, using the generator *a* either alone or in conjunction with the superheater.

It is not alleged that this process is employed by the defendant, and the question of the novelty of the process has not been referred to in the testimony of the expert witnesses. If it were void for want of novelty, it would be necessary for the complainants to file a disclaimer, and by doing so their right to recover for infringement of the other invention of the claim would not be affected, except as respects costs. (*Tuck* v. *Bramhill*, 6 Blatchf., 95; *Taylor* v. *Archer*, 8 Blatchf., 315.) As the point has not been made, and as it is not charged that the defendant uses this process, this process does not require further consideration. It is plain upon the proofs that the defendant does employ the first process of the claim. The issue is upon its patentability.

The gist of the invention in controversy consists in the use of a new apparatus for the treatment of the materials from which the gas is made. The same materials had previously been treated by the same series of steps, in the same order of succession, to produce a similar product. It was old to make illuminating water-gas by first producing a non-illuminous gas by the action of steam upon incandescent fuel, then adding to this gas hydrocarbons and converting them into vapor or gas, and then passing this mixture through a fixing-chamber, and apparatus of various kinds for performing these operations was old. All the essential apparatus of the patent was old, and had previously been used for carrying out these several steps, except the fixing-chamber, and that differs only from previously-used fixing-chambers in that it is so constructed and arranged in relation to the generator that it is heated internally by the products of combustion that escape from the generator and envelop the refractory material, instead of being heated by an external fire. Under these circumstances the novelty of the invention consists in the novelty of combining the fixing-chamber of the patent with the other devices with which it is to be employed. It is plain upon the proofs that the patentee was the first to employ a fixing-chamber in combination with the other parts, which enabled the products of combustion that escape from the generator during the operation of "blowing up" to fix or render permanently gaseous the mixture of hydrocarbonic oxide and hydrocarbon vapors produced in a close chamber.

A number of prior patents are relied upon by the defendant to defeat the novelty of such a combination. The case would have been much simplified and the court relieved of much unnecessary labor if all but two of these patents had been omitted from the record.

The patent to Harkness of 1874 describes a process which is in all essentials the process and apparatus in controversy, except that the fixing-chamber is a retort fired by external heat.

The English patent to Siemens of 1864 describes apparatus for converting carbonaceous matter into combustible gases and for their application to the heating or fusing of metals and other substances. The apparatus contains a superheater which is a chamber in which fire-bricks are loosely piled, to which the gas produced in the generator escapes, communicating heat which will be communicated to the next portion of gas which passes through the superheater. The gas made by this process contains 61 per cent. of nitrogen, and the superheater of the apparatus is not intended or used as a fixing-chamber in the sense of that term as used in the complainants' patent. It is used to superheat a gas produced by combustion on its way to a furnace where it is to be used in heating or fusing metals, &c. The other patents relied upon by the defendant are more remote from the invention than the Harkness patent.

The patent to Arbos of 1863 describes apparatus in which the fixing-chamber is heated externally, and the gas is made by a continuous process in which air is constantly blown into a bed of coals.

The British patent of 1868 to Benson and Valentine describes apparatus in which there are employed two distinct and separate fires. The first of these is a fire in which air is admitted at the bottom of the combustion-chamber. The products of combustion are passed through a second fire, maintained by a separate current of air. The product of the first fire is a mixture of nitrogen, carbonic-acid, carbonic-oxide, and hydrocarbon gases and tarry matters. The object of the second fire is to destroy the tarry matters which are present. The process is a continuous one, and the gas made by it is not a practical gas for illuminating purposes on account of the quantity of nitrogen which it inevitably contains, derived from the two fires supplied with air, and the products of the first fire are not passed through a second chamber which has been previously heated by direct internal combustion.

The patent to Lowe of 1872 involves the use of a generator in which bituminous substances are maintained in a state of slow combustion by the action of currents of air. A distillation of the bituminous matter takes place above the fire, and the combustible gases result. These gases, mixed with the products of combustion, pass to a superheater which is heated externally. The process of this patent is an air process in which the fixing-chamber is heated externally, and the product is a gas which is very rich in nitrogen.

It suffices to say of the other patents which have been relied on in the argument for the defendant that the Blair patent describes an air process and an externally-heated fixing-chamber, and in the apparatus of the Kirkham patent and of the Saunders patent there is no fixing-chamber.

None of the patents, except the Harkness patent, describe inventions for making the product of the complainants' process. They were all directed to the production of gas differing essentially in the quantity of the nitrogen present, and involve the air process or the continuous as distinguished from the intermittent process. But the process of the Harkness patent was directed to the production of the gas of the complainants' patent, made in a close chamber after the air has been excluded, and, as has been said, involves every essential step and detail of the process of the complainants' patent, except the use of a different fixing-chamber. The Patent Office rejected the claim now in controversy as void for want of novelty until it was so amended as to limit it to a process in which the fixing-chamber used was one "previously heated by direct internal combustion." Very plainly, the prior state of the art required this limitation to be made in order to confine the claim to the real invention of the patentee. The novelty of the claim accordingly turns upon the question whether novelty is present or absent in the substitution of the fixing-chamber described. If it did not involve invention to introduce such a fixing-chamber in the apparatus of Harkness, there is no novelty in the invention claimed.

It cannot be safely affirmed that those skilled in the art, having the Siemens patent before them, would derive any material assistance from it in devising the fixing-chamber of the complainants' patent. The Siemens apparatus is designed and used in a process of gas-making in which the gas has no hydrocarbon vapors to be broken up and fixed. Hydrocarbon gases and vapors are destroyed if exposed to a too high temperature, and the Siemens patent does not seem to offer a suggestion to assist an expert to ascertain that the superheater could be practically employed in treating hydrocarbon gases as they are required to be treated in the fixing-chamber of the Harkness process or the process of the complainants' patent.

One of the experts for the complainants testifies in substance that the Siemens superheater was not designed to perform the functions of a fixing-chamber; that "fixing" in gas-making is a term which is unquestionably limited to cracking up condensible hydrocarbon vapors into permanent hydrocarbon gases to effect a chemical decomposition, destroying one set of substances not suitable for illuminating-gas and creating another set of substances extremely valuable in illuminating-gas, and that no such materials or products occur in the Siemens operation and no such chemical changes result in the regenerating-chamber of the Siemens apparatus.

The patent is no more an anticipation of the present invention than the Harkness patent is. Any prior apparatus which would not produce the same results as the apparatus of the present invention cannot be substantially the same apparatus. The patent shows that a secondary chamber through which gas from a generator passes can be heated by placing refractory material within it to be enveloped by the gas. To this extent it is of some value as showing the use of appliances, in principle like those of the complainants' patent, for a cognate purpose, and beyond this it is not valuable. The Harkness patent exhibits the present invention more nearly than does the Siemens patent: but the Harkness patent is not an anticipation of it, because the parts of the apparatus in combination do not operate in the same way to produce the same results. Invention was not necessarily absent in making the substitution of the fixing-chamber of the patent for the fixing-chamber of Harkness because Siemens had previously used his device to superheat a different gas. It would have been absent if the Siemens device had been obviously adapted to supply the place of the externally-heated fixing-chamber in the Harkness apparatus. But the inquiry is whether the adaptability of the Siemens superheater to fix the gas of the Harkness patent was self-evident to the intelligence of those skilled in the art. If it had been, why was not the substitution made? It introduced very desirable advantages into the process of making illuminating water-gas. The experts on both sides concede that the fixing-chamber of the patent can be heated more economically and more quickly than the fixing-chambers which were previously used, as in the Harkness apparatus or in similar apparatus. If the making of this change had been an obvious thing, falling within the range of ordinary mechanical adaptation, it is probable that those skilled in the art would have sought to avail themselves of its advantages, yet, as appears by the prior patents in the record, the more expensive method of fixing the gas in retorts heated by external fires was everywhere followed. The various manufacturers in this country who were making gas according to the Tessie du Motay process and using the externally-fired retort did not discover what it is now asserted was an obvious thing. The fact that the older organizations which it is now claimed were susceptible of being modified by mere mechanical skill into the apparatus of the patent remained without any such modification until the patentee made it, and his improvement when made was so useful and valuable as to commend itself at once to those skilled in the art to which it relates, is sufficient to resolve any doubt whether the improvement embodies invention in favor of the patent.

A decree is ordered for the complainants.

U. S. Circuit Court—Southern District of New York.

DOBSON *et al. v.* CUBLEY.

Decided June 19, 1889.

INFRINGEMENT.

Banjos made under Letters Patent issued April 3, 1883, to E. J. Cubley, for improvement in banjos, in which the parchment rests directly on a rim consisting of a metal shell, in form like the old wooden rim, but differing from any rim previously made, and producing by such rim distinctive musical properties, do not infringe Letters Patent issued May 17, 1878, to C. E. Dobson, for an improvement consisting of a ring, either of metal or wood, to ease the wear of the parchment against the rim, and improve the tone of the instrument; nor do they infringe Letters Patent issued November 18, 1881, to Henry C. Dobson, whose improvement consists of a metal ring between the parchment and a rim of wood and metal, and which eases the parchment, as does the ring in the first patent, and produces a metallic musical sound.

BILL TO restrain infringement of patent.

Mr. Arthur S. Brown and *Mr. Albert Comstock* for the complainants.

Mr. Edward P. Wilder and *Mr. Howard Henderson* for the defendant.

WALLACE, *J.*:

The question in this case is whether banjos made conformably to the patent to Edwin J. Cubley, dated April 3, 1883, are an infringement of the patents granted one to Charles E. Dobson, dated May 14, 1878, and one to Henry C. Dobson, granted November 18, 1881, for improvements in banjos.

The banjo of the first Dobson patent contains a dome-shaped ring interposed between the parchment and a wooden rim. The ring may be of metal or of wood, and serves to ease the wear which the parchment is subjected to when the rim has an angular edge, and to improve the tone or resonance of the instrument. When the ring is made of metal, it im-

parts a metallic tone to the instrument. If made of wood, as it may be by the patent, it is doubtful whether the musical properties of the instrument would be improved. Whether the ring is made of metal or wood, the amount of material used will affect these properties. In easing the wear upon the parchment what is done by the ring was as well accomplished practically by the wooden rims, which were previously used, having the edge rounded where it came in contact with the parchment. The banjo of the second Dobson patent has a metal ring formed with two downwardly-projecting flanges interposed between the parchment and a rim composed of wood and metal. The ring is curved at the part which comes in contact with the parchment, and therefore serves to ease the wear upon the parchment similarly with the ring of the first patent. So much of the ring is out of contact with the parchment that it has a vibratory movement, and the ring thereby imparts a bell-like tone to the instrument; and the further this free portion extends beyond the point of contact with the parchment the more emphatic will be the metallic ringing or bell-like quality of the sound. Not only is the ring an element of each of the claims in controversy in both of the Dobson patents, but its peculiar form is essential in each invention in producing peculiar musical properties of the instrument. These are varied in each by the dimensions and form of the ring, and in the banjo of the second patent the combination of wood and metal in the rim is a factor.

The banjo of the defendant does not infringe either of these patents, because it has no ring. In this banjo the parchment rests directly on the rim. The rim consists of a metal shell made by turning over the edges of a piece of sheet metal. If a piece of sheet metal were turned over the old round-edged wooden rim so as to completely inclose it, the rim of the defendant's banjo would be produced. As respects form, it is the old round-edged wooden rim. As, however, it is made of metal and is hollow, it differs from any rim which had been devised previously. It cannot be doubted that these differences impart distinctive musical properties to the instrument. Of necessity, such an instrument differs as essentially in the character and quality of its musical tones from either of the Dobson banjos as the Dobson banjos differ from one another. There is no identity of parts or of result in the several instruments. The invention of Cubley has as much originality as either one of Dobson. The hollow rim of his banjo is not an equivalent for the solid rim and the ring of Dobson, because it was not a known mechanical substitute for them and does not effect the same result.

The bill is dismissed, with costs.

U. S. Circuit Court—Southern District of New York.

PHILADELPHIA NOVELTY MANUFACTURING COMPANY *v.* ROUSS.

Decided July 8, 1889.

1. REISSUE—EXPANSION OF INVENTION—VOID.

Complainant's original patent embraced hair-crimpers of two kinds—one in which the fabric is stitched to the soft-metal core, the other in which the fabric is fastened to the core by a metal fold made by turning over the thin edges of the core, or of a strip of sheet-lead inside the fabric over the core. The original contained the clause: "I also modify my invention in various other equivalent ways, such as would suggest themselves to any intelligent mechanic," &c. The reissued patent contained claims for fastening the fabric to the core by cementing them together. *Held* that the reissue was invalid, being an expansion of the original and embracing a new invention.

2. SAME—SAME—LACHES.

If it be conceded that the inventions claimed in the reissue were described in the original, then, such claims being expansions and more than 3 years having elapsed after the original was granted before the reissue was applied for, the doctrine of laches applies and the delay must be held unreasonable in the absence of explanatory averments in the bill.

ON DEMURRER to bill for infringement of patent.

Mr. Joshua Pusey (*Mr. H. F. Fenton* of counsel) for the complainant.

Mr. John J. Jennings for the defendant.

WALLACE, *J.*:

All of the claims of the reissued patent in suit are for inventions not shown or suggested in the original patent, with the exception of claims 5 and 6. The invention of the original patent embraced hair-crimpers of two kinds—one in which the fabric is applied to the soft-metal core by stitching, and another in which the fabric is fastened to the core by a metal fold made by turning over the thin edges of the core, or of a strip of sheet-lead inside the fabric over the core. Two of the claims (the third and sixth) were for the core separately, with modifications, and all the others were for the core with the fabric attached to it in one of these specified ways. The specification of both the original and the reissued patent closes with this clause:

I also modify my invention in various other equivalent ways, such as would suggest themselves to any intelligent mechanic to meet special requirements.

It is insisted now for the complainant that fastening the fabric to the core by cementing them together is an equivalent mode of fastening them to stitching or turning in the lateral edges of the core or its supporting-strip. Claims 1, 2, 3, 4, and 7 are expansions of claims of the original, apparently intended to embrace the cemented fastening in the claims as well as the fastening by stitching or turning over the edges of the metal. If it is true, as argued, that this is only the introduction of an equivalent into the claims, it was wholly unnecessary, and it may reasonably be assumed that the Patent Office did not so consider it. It must be held that these claims were designed to expand the claims of the original and take in inventions which are not found in the original, and are therefore invalid. If it should be conceded that the inventions now claimed were described in the original patent, then, as the claims of the reissue are expansions and more than 3 years elapsed after the original was granted before the reissue was applied for, the doctrine of laches applies, and the delay must be held unreasonable in the absence of any explanatory averments in the bill accounting for it. (*Wollensak* v. *Reiher*, 31 O. G., 1301; 115 U. S., 96; 5 Sup. Ct. Rep., 1137.)

The special demurrers to the bill are sustained. As the principal controversy has been upon the matters raised by these demurrers, costs are allowed to the defendant. The general demurrers are not sustained because, unless the patent is invalid for want of novelty, the fifth and sixth claims are good and entitle the complainant to a decree for infringement, and the court cannot decide as matter of law upon the face of the patent without the aid of extrinsic evidence that those claims are destitute of inventive novelty.

REPORT OF THE COMMISSIONER OF PATENTS FOR 1888–'89	1777

Changes in Classification.

(ORDER No. 578.)

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., September 2, 1889.

The following changes are directed in Division IV:

New Class 189, Iron Structures, and sub-classes thereunder are established, as follows:

1. Jails.
2. Buildings.
3. Grilles.
4. Metallic ceilings.

The following sub-classes are established:

In Class 14, Bridges:
11. Flooring.
12. Truss, Bow-string.

In Class 108, Roofing:
8. Flashing.

In Class 159, Fire Escapes and Ladders:
20. Fluid-check.
21. Fly-check.
22. Escapement-check.
23. Governor-check.

ROBERT J. FISHER,
Acting Commissioner.

Additional Sub-Classes.

(ORDER No. 579.)

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., September 3, 1889.

The following additional sub-classes are hereby established in Division XXVI:

In Class 171, Electricity, Generation:
121. Inductoriums—
122. Induction-coils.
123. Transformers, Rotary.
124. Transformers, Stationary.
125. Pyro-magneto-electric devices.

In Class 173, Electricity, Motive-Power:
126. Motors, Reciprocating.

ROBERT J. FISHER,
Acting Commissioner.

Attorneys.

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SECRETARY,
Washington, D. C., September 18, 1889.

SIR: The Secretary of the Interior has ordered that J. M. D. Miller, of Iuka, Miss., be not recognised after this date as attorney or agent in the prosecution of any claim or other matter before this Department or any bureau thereof.

Very respectfully,
E. M. DAWSON,
Chief Clerk.

The Commissioner of Patents.

"The compound word 'DHAAMA-RHEUMA.'"

17,050.—HORSE-BLANKETS.—*L. C. Chase & Co.*, Boston, Mass. Application filed June 13, 1889. Used since January, 1885.

"The representation of three horses' heads constituting a copy of J. F. Herring's, Sr., picture of Pharaoh's horses."

17,051.—WHITE PAINT GROUND IN LINSEED-OIL.—*Marshall P. Drury*, Cincinnati, Ohio. Application filed July 26, 1889. Used since April, 1887.

"The words 'WHITE OCHRE.'"

17,052.—THRASHING-MACHINES.—*Eagle Machine Works Company*, Indianapolis, Ind. Application filed August 17, 1889. Used since June 1, 1888.

"The word 'HUSTLER.'"

17,053.—REMEDIES FOR ASTHMA.—*François Gouaux*, Houma, La. Application filed August 15, 1889. Used since January 1, 1886.

"The capital letter 'F' inclosed within or surrounded by the capital 'G.'"

17,054.—MACHINERY PACKING.—*Greene, Tweed & Co.*, New York, N. Y. Application filed August 13, 1889. Used since 1874.

"The word 'MANHATTAN.'"

17,055.—SHERRY WINE.—*Diez Hermanos*, Jerez de la Frontera, Spain. Application filed August 16, 1889. Used since January 1, 1882.

"The words 'YBASI SHERRY' and the letters 'V L' in monogram."

17,056.—SHERRY WINE.—*Diez Hermanos*, Jerez de la Frontera, Spain. Application filed August 16, 1889. Used since January 1, 1837.

"The word 'YBASI' and the letters 'V L' in monogram."

17,057.—KNITTING AND DARNING YARNS.—*Morse & Kaley Manufacturing Company*, Milford, N. H. Application filed August 15, 1889. Used since January 1, 1884.

"The words 'BLACK CARD' on a black background."

17,058.—TEA.—*McClure & Ridpath*, New Orleans, La. Application filed August 13, 1889. Used since January, 1889.

"The word 'TOKAY.'"

17,059.—VERMOUTH.—*Noilly Prat & Cie.*, Marseilles, France. Application filed December 30, 1885. Used since 1855.

"The letters 'N. P. & CIE.' and an inscription in four languages, the whole printed in blue on white paper."

17,060.—VERMOUTH.—*Noilly Prat & Cie.*, Marseilles, France. Application filed December 30, 1885. Used since 1855.

"The words 'NOILLY PRAT & CIE.'"

17,061.—HERMETICALLY-SEALED SALMON.—*Peninsular Trading and Fishing Company*, San Francisco, Cal. Application filed August 19, 1889. Used since May 15, 1889.

"The word 'COMPASS' and a pictorial representation of a mariner's compass."

17,062.—HERMETICALLY-SEALED SALMON.—*Peninsular Trading and Fishing Company*, San Francisco, Cal. Application filed August 19, 1889. Used since May 15, 1889.

"The words 'STAR OF ALASKA' and a representation of Mount St. Elias."

17,063.—POLISH FOR JEWELRY, METALS, MIRRORS, AND THE LIKE.—*Waldo Reed* and *Edward S. Barton*, Taunton, Mass. Application filed August 9, 1889. Used since January, 1888.

"The word 'ARGENTALA.'"

17,064.—CANNED SALMON.—*Russian American Packing Company*, San Francisco, Cal. Application filed June 19, 1889. Used since February 21, 1889.

"The words 'RUSSIAN AMERICAN' and the flags of Russia and the United States having their standards crossed, a circle or disk with rays around its periphery, and a rectangular black background."

17,065.—CARRIAGE OR DRIVING WHIPS.—*Sanford Whip Company*, Westfield, Mass. Application filed August 17, 1889. Used since July 1, 1889.

"The words 'NEW PROCESS.'"

17,066.—TOOTH-PASTE, COLD CREAM, LIP-SALVE, SHAVING-PASTE, AND SHAVING-SOAP.—*Henry Bedford Sleeman*, Addiscombe, county of Surrey, England. Application filed August 15, 1889. Used since December 19, 1888.

"The representation of a flower of honeysuckle."

17,067.—HAND-MADE SOUR-MASH WHISKY.—*E. H. Taylor, Jr., & Sons*, Frankfort, Ky. Application filed August 13, 1889. Used since January 1, 1887.

"A script fac-simile signature 'E. H. TAYLOR, JR., & SONS.'"

17,068.—LATHE-CHUCKS.—*Westcott Chuck Company*, Oneida, N. Y. Application filed August 16, 1889. Used since March 1, 1873.

"The word 'WESTCOTT.'"

17,069.—MEDICINAL PREPARATIONS FOR TREATING AND BEAUTIFYING THE FINGER-NAILS.—*Lizzie M. Weston*, Amherst, N. H. Application filed August 19, 1889. Used since March 1, 1889.

"The words 'LA ROSIÈRE.'"

17,070.—DRESSED POULTRY.—*William C. Williams*, Ocean, N. Y. Application filed April 19, 1889. Used since July 1, 1888.

"The words 'FRENCH FATTENED' and the representation of a dressed fowl."

LABELS.

6,021.—Title: "GOUAUX'S ANTI-ASTHMATIC POWDER."—*François Gouaux*, Houma, La. Application filed August 15, 1889. (Trade-Mark Registered.)

6,022.—Title: "ARNICA PREMIUM SALVE."—*John A. Jungkind*, Little Rock, Ark. Application filed January 25, 1888.

6,023.—Title: "IRONDALE SPRING WATER." (For natural mineral water.)—*Felix Nemegyei*, Irondale, W. Va. Application filed August 27, 1889.

6,024.—Title: "SMITH'S IRON WOOD AND VEGETABLE SPECIFIC BITTERS."—*George Smith*, Little Cooley, Pa. Application filed August 29, 1889.

PATENTS

GRANTED SEPTEMBER 24, 1889.

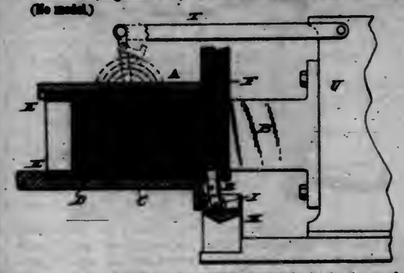
411,412. EXCELSIOR-MACHINE. FRANK ABEL, Kansas City, Mo. Filed Sept. 27, 1888. Serial No. 286,494. (No model.)

Claim.—1. In an excelsior-machine, the combination, with a rotary cutter-wheel and means for holding the bolts in engagement with the cutters, of a radially-sliding scorer carried by the wheel, and a centrally-located cam connected with the radially-sliding scorer, whereby the said scorer is slid radially by said centrally-located cam and caused to travel forward in a right line at intervals during its revolution with the cutter-wheel, substantially as set forth.

2. In an excelsior-machine, the combination, with a rotary wheel provided with a series of stationary cutters and means for feeding the bolts to the cutters, of a set of radially-sliding scorers alternating with the cutters, and a centrally-located endless cam connected with the radially-sliding scorers, portions of the cam being curved inwardly to correspond with and offset the outward curve of the periphery of the wheel between any two predetermined points, whereby the said scorer is slid radially by said centrally-located cam and caused to travel forward in a right line at intervals during its revolution with the cutter-wheel, substantially as set forth.

3. The combination, with the upright rotary cutter-wheel and radially-sliding scorers carried by the wheel and actuated by a stationary cam at the central portion of the wheel, of feed-rollers journaled in pairs in front of the wheel, bevel-gear on the cutter-wheel, a vertical shaft driven by said bevel-gear, and oblique shafts driven by said vertical shaft and in engagement with the feed-roller shafts to actuate the same, substantially as set forth.

4. The combination, with the upright rotary cutter-wheel and scorers, carried by the cutter-wheel, of the herein-described feed mechanism, consisting of the parallel supporting-bars, the lime-roller journaled in stationary bearings, the top roller journaled in movable bearings provided with rack-teeth, the shaft for operating the movable bearings held under yielding tension, the shaft provided with right and left hand worms to operate the rollers, and the actuating-shaft, substantially as set forth.



5. The combination, with the cutter-wheel mounted upon the main shaft and bearings for said shaft, the upper half of said bearings being provided with a socket-bearing, of an upright drive-shaft seated in said socket-bearing and geared with the main shaft, and the feed mechanism geared with said upright drive-shaft, substantially as set forth.

6. The combination, with the cutter-wheel provided in its face with radially-disposed elongated slots, of frames secured around the edges of said slots, and radially-sliding scorer-holders secured in said frames, substantially as set forth.

7. The herein-described frame for the scorers, consisting of a bar having an elongated opening in its outer end and guides along its edges, the said bar being provided with depending lugs recessed to receive the ends of the scorer-box frame, and adjusting devices to hold the scorer-box in position, substantially as set forth.

8. The herein-described frame for the scorers, consisting of a bar having an elongated opening in its outer end and guides along its edges, the said bar being provided with depending lugs recessed to receive the scorer-box and with a braced stud to engage the operating-cam, substantially as set forth.

411,413. MACHINE FOR MAKING BUILDING-BLOCKS. JAMES C. ANDERSON, Highland Park, Ill. Filed Dec. 4, 1888. Serial No. 292,982. (No model.)

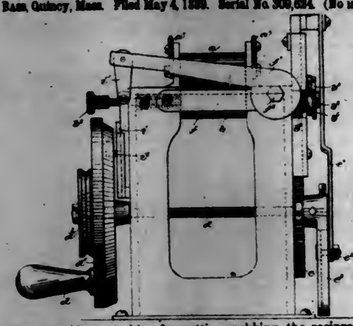
Claim.—1. A machine for making clay blocks having a face representing the natural fracture of stone, consisting of an elongated open-ended molding-chamber, in which the clay bodies are formed by a series or successive layers of clay, said mold-box being in two parts and adapted to break the clay body into blocks or slabs, as set forth.

2. In a machine for making clay blocks with a face representing the natural fracture of the stone, a mold-box divided into two parts, one part being adapted to be moved away from the other to break or tear the clay body into two parts.

3. In a machine of the character described, the movable mold-section D, connected to the section C by means of the link L and bell-crank lever M, in combination with the ratchet-wheel P, having the groove *b*, as set forth.

4. In a machine of the character described, the pitman T, lever S, pawl R, pinion-wheel P, having the groove *b*, in combination with the bell-crank lever M, link L, and mold-sections C and D, as set forth.

411,414. ELECTRO-MAGNETIC SEPARATOR. WILLIAM A. ANTHONY, Manchester, Conn., assignor to the Mather Electric Company, same place. Filed June 26, 1889. Serial No. 315,994. (No model.)



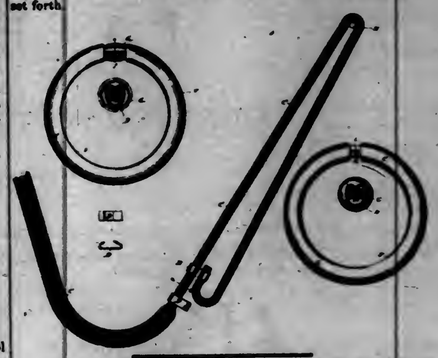
Claim.—1. The combination of a revolving electro-magnet and an endless non-magnetic apron carried thereby and adapted to carry mixed magnetic and non-magnetic substances and to drop the non-magnetic bodies in these substances at one place, with a roller revolving parallel to the electro-magnet and under the endless apron and adapted to hold the magnetic bodies in these substances between it and that apron, and thus to carry them far enough out of the magnetic field to enable them to drop at another place when released from between the roller and the apron, all substantially as described.

2. The combination of the spool 1, wound with the coil 2 and electrically connected, substantially as described, with endless non-magnetic apron 12, passing around and in contact with a part of the periphery of the spool 1 and adapted to carry mixed magnetic and non-magnetic substances upon its outer surface and to drop the non-magnetic bodies in those substances at one place, with a roller revolving parallel to the spool 1 and under the apron 12, and adapted to hold the magnetic bodies in those substances between it and that apron, and thus to carry them far enough out of the magnetic field to enable them to drop at another place when released from between the roller and the apron, all substantially as described.

3. In an electro-magnetic separator, the combination of the spool 1, wound with the coil 2 and electrically connected, substantially as described, and means, substantially as set forth, for removing magnetic substances from the magnetic field of that spool and coil, all substantially as described.

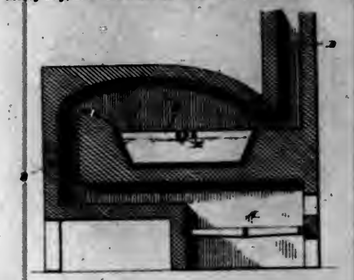
411,415. MACHINE FOR CUTTING WEBBING. EDWARD W. H. BAM, Quincy, Mass. Filed May 4, 1889. Serial No. 309,634. (No model.)

Claim.—1. In a machine for cutting webbing, the reciprocating cutting-blade, and cam-grooved wheel and connecting mechanism for reciprocating it, combined with the feed-roll b, toothed wheel b^4, pawl-carrier and pawl, ratchet-wheel b^3, rack c, connecting-rod c', crank-arm c^3, substantially as described.



2. In a machine for cutting off webbing, the movable cutting-blade and means for moving it intermittingly, the feeding devices, and means for moving them intermittingly and alternately with relation to the movements of the cutting-blade, combined with the cap b^3, for rotating the driving-roll of the feeding devices independently of the of the cutting-blade, substantially as described.

3. In a machine for cutting off webbing, the intermittingly-movable cutting-blade and means for moving it, and intermittingly-movable driving-roll for the feeding devices, combined with the toothed wheel b^4, pawl-carrier and pawl, the ratchet-wheel b^3, rack c, connecting-rod c', and crank c^3, and drive-shaft b, substantially as and for the purposes set forth.



411,416. METHOD OF MAKING ARMLETS, &c. GILBERT H. BLAKESLEY, Bristol, Conn., assignor to the Blakesley Novelty Company, same place. Filed Mar. 25, 1889. Serial No. 304,613. (No model.)

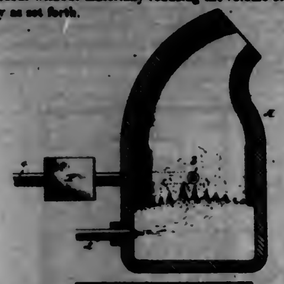
Claim.—1. A method of working up elastic stock composed of rubber strands and a fibrous envelope therefor into short sections bound at each end, consisting in binding the free ends of the rubber and fiber together, then stretching the stock, then binding the stretched rubber and fiber together again at two closely adjacent points, and then cutting the stock between such points, substantially as set forth.

2. A method of working up elastic stock composed of rubber strands and a fibrous envelope therefor into circlets, consisting in binding the free ends of the rubber and fiber together, then stretching the stock, then attaching the said bound ends to the stretched stock and binding the rubber and fiber thereof together at the said point of attachment, then binding the stretched rubber and fiber together again at a point close to the said point of attachment, and then cutting the stock between the two bound points last mentioned, substantially as set forth.

411,417. PROCESS OF REFINING IRON. JOHN W. BOOKWALTER, Springfield, Ohio, assignor to the Bookwalter Steel and Iron Company, Jersey City, N. J. Filed Oct. 22, 1888. Serial No. 288,765. (No model.)

Claim.—1. The mode described of treating iron, the same consisting in subjecting a bath of the molten metal to the action of a converting agent and producing a local violent atomic action at the surface of the bath upon successive portions of the metal by means independent of the converting agent, substantially as set forth.

2. The within-described improvement in treating iron, consisting in subjecting a body of the molten metal to the action of an oxidizing converting agent, and also in projecting upon a portion of the surface of the bath a non-oxidizing blast to produce a local agitation, and also to impart to the body of the metal a gyrating motion to bring all portions thereof in succession in position to be acted on directly by the blast, substantially as set forth.



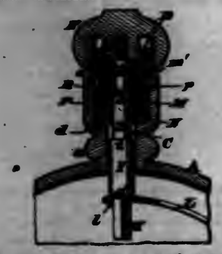
3. The mode described of treating iron, the same consisting in subjecting a bath of the molten metal to the action of a converting agent and producing a local violent atomic action at the surface of the bath upon successive portions of the metal by a non-oxidizing blast, substantially as set forth.

4. The within-described improvement in treating iron, consisting in subjecting a body of the molten metal to the action of an oxidizing converting agent, and also in acting upon a portion of the surface of the bath by means independent of the converting agent to produce a local agitation, and also to impart to the body of the metal a gyrating motion to bring all portions thereof in succession in position to be acted on directly by the blast, substantially as set forth.

411,418. PROCESS OF CONVERTING CRUDE IRON INTO MALLEABLE IRON OR STEEL. JOHN W. BOOKWALTER, Springfield, Ohio, assignor to the Bookwalter Steel and Iron Company, Jersey City, N. J. Filed Nov. 6, 1888. Serial No. 290,121. (No model.)

Claim.—1. In the process of converting crude iron, maintaining the molten metal under the action of a blast containing an oxidizing agent, and reducing the proportion of oxidizing agent during the process of conversion while maintaining substantially the volume of the blast, substantially as set forth.

2. The improvement in converting crude iron, consisting in subjecting the molten metal to the action of a blast both of oxidizing and non-oxidizing gas, and in reducing the volume of oxidizing gas as the process proceeds without materially reducing the volume of the blast, substantially as set forth.



411,419. PROCESS OF CONVERTING CRUDE IRON INTO MALLEABLE IRON OR STEEL. JOHN W. BOOKWALTER, Springfield, Ohio, assignor to the Bookwalter Steel and Iron Company, Jersey City, N. J. Filed Nov. 26, 1888. Serial No. 292,126. (No model.)

Claim.—The within-described improvement in the process of converting crude iron into malleable iron or steele by a blast acting upon part of a body of metal to impart a gyration thereto and strip therefrom limited portions in succession, the said improvement consisting in diminishing the proportion of oxygen in the blast and in also varying the quantity and pressure of the blast during the process of conversion, substantially as and for the purpose set forth.

411,420. WATCH-CASE PENDANT. WILLIAM W. BRADLEY, Newport, Ky., assignor to John C. Dueber, same place. Filed May 6, 1889. Serial No. 309,671. (No model.)

Claim.—1. A chambered watch-case pendant provided with a longitudinally-shiftable stem that operates the case-spring, said stem having a spindle of reduced diameter and a shank of less diameter than said spindle, in combination with a clutch fitted within said chamber, which clutch is normally inoperative, but grasps said spindle and revolves in unison therewith when the stem is advanced and engaged with the hand-setting mechanism, a keeper that prevents longitudinal sliding of said clutch, and a stop that limits the outward pull of said stem, substantially as herein described.

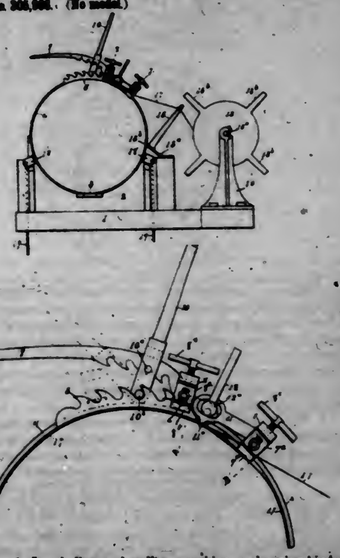
2. A watch-case pendant, as B, having a screw-threaded chamber D and bearing d, in combination with the longitudinally-shiftable stem G H A I i F K, clutch N O o P p R, and a tubular nut M m, that screws into said chamber and holds said clutch against said bearing d, as herein described.

3. In a watch-case pendant, the slotted spring-clutch N' O o P p R, having its collar N' fitted loosely within the annular groove S of the tubular nut M m, and secured therein by upsetting said nut at s, for the purpose described.

4. The combination of an interiorly-threaded watch-case pendant, a nut engaged with said thread and having an upwardly-flaring bore, a spring-clutch held in place by said nut, so as to be free to revolve, but incapable of longitudinal shifting, and a shouldered stem that slides within said spring-clutch, for the purpose herein described.

411,421. TYPE-WRITING MACHINE. ALEXANDER T. BROWN, Syracuse, N. Y. Filed Oct. 31, 1887. Serial No. 253,893. (No model.)

Claim.—1. The combination, with the printing characters of a type-writing machine, of a type-cleaner in proximity to a plurality of said printing characters, and a brush-shifter by which the cleaner may be moved in contact with and clean a number of the characters simultaneously, substantially as described.



2. The combination, with the printing characters of a type-writing machine arranged in a circle, of a circular brush of about the same radius supported on the machine in proximity to said characters, so that the brush can come in contact with a plurality of type at one time, substantially as described.

3. The combination, with the printing characters of a type-writing machine, of a brush supported on the machine, a shifter for moving said brush laterally, and mechanism (as a screw and nut) for shifting the brush vertically with reference to the printing characters, substantially as described.

4. The combination, with the printing characters of a type-writing machine arranged in a circle, of a circular cleaner and a screw-threaded shaft attached to said cleaner and operating in a socket in alignment with the center of the circle round which the printing characters are arranged.

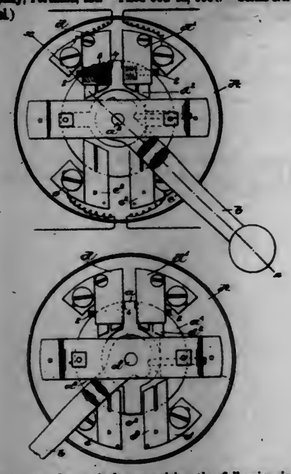
5. The combination, with the printing characters of a type-writing machine arranged in a circle, of a rotating brush supported in a socket beneath the center of said circle, and a detachable handle by which said brush may be operated, substantially as described.

411,422. BALING OR BUNDLING MACHINE. DENNIS D. BROWN, Utica, N. Y., assignor to Mary E. Brown, same place. Filed Apr. 4, 1889. Serial No. 305,995. (No model.)

Claim.—1. In a baling or bundling machine, a clamping-binder having a toothed rack secured to one of the free ends of the binder and a pin upon the other free end, two levers adapted to engage each other, and one of the levers engaging the pin secured to the binder and the other adapted to engage the rack.

2. In a baling or bundling machine, a clamping-binder having a toothed rack and the vise secured to one of the free ends thereof, and the pin adapted to be engaged in the rack and the vise secured to the other end thereof, in combination with the two levers engaging each other, and one of the levers engaging the pin and the other adapted to engage the rack, substantially as set forth.

3. In a baling or bundling machine, the combination, with a clamping-binder having the rack, pin, and vise mounted thereon, of the clamping-edge adapted to clamp the wire to the bundle, substantially as set forth.



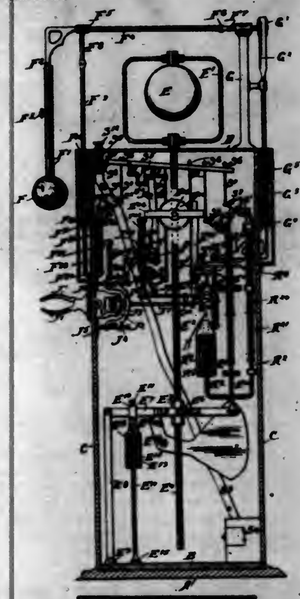
4. In a baling or bundling machine, the combination, with a clamping-binder having the rack, pin, and vise mounted thereon, of the two levers engaging each other, and one of the levers engaging the pin and the other adapted to engage the rack, and the clamping-edge adapted to clamp the wire to the bundle, substantially as set forth.

5. In a baling or bundling machine, the combination of the clamping-binder having the rack, pin, and vise mounted thereon, substantially as set forth, and the levers, one of which engages the pin and the other adapted to engage the rack and engaging each other, and the reels adapted to supply wire to the machine.

6. The combination, in a baling or bundling machine, of two encircling clamping-binders concentric and parallelly hinged to a base to open apart, substantially as shown and described.

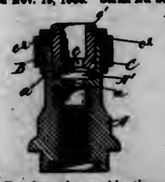
7. The combination, in a baling or bundling machine, of two encircling clamping-binders concentric and parallel and hinged to a base, so as to open apart, and a stop at the side of and parallel with one of the binders, substantially as shown and described.

411,423. SAFETY-SWITCH FOR INCANDESCENT LIGHTS AND OTHER ELECTRICALLY-CONTROLLED DEVICES. OSMAN S. BOARDMAN, Somerville, Mass., assignor to the Bernstein Electric Light Manufacturing Company, Portland, Me. Filed Oct. 12, 1887. Serial No. 252,121. (No model.)



Claim.—1. A safety-switch comprising the following instrumentalities in combination: a disk having thereon two contact plates or surfaces constituting the movable member, contact-pens d^2 d^3, constituting the stationary members, and blocks to which they are attached, a hand-lever for moving the movable member of the switch, and one or more spring-controlled plugs in electrical connection with one or more blocks, and the fusible retaining device for the plugs, substantially as described.

2. The combination, with an electric switch comprising as a co-operative part of it two blocks d d', of one or more spring-controlled plugs in electrical connection with one or both blocks, and a fusible retaining device for the plugs, substantially as described.

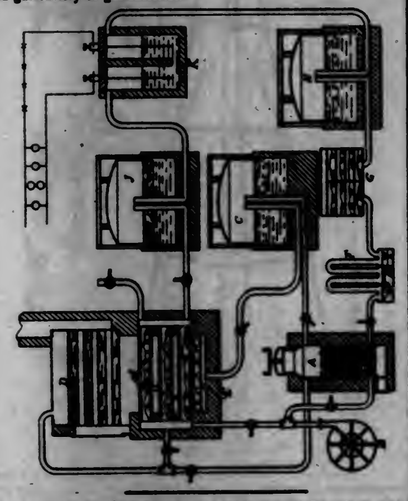


411,424. COIN-CONTROLLED TESTING-MACHINE. EDWARD J. OBST, Chicago, Ill. Filed Aug. 3, 1888. Serial No. 282,260. (No model.)

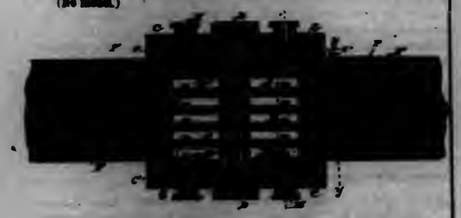
Claim.—1. In a testing-machine, the combination of a series of testing apparatuses terminating each within the case in a rod, a series of spring-supported sleeves, one on each of said rods, a series of pivoted dogs whose points normally lie in the paths of such sleeves, and a coin-controlled releasing-lever which moves all of such dogs and clears the paths for such sleeves.

2. In a coin-controlled testing-machine, the combination of two pivoted hand-pieces with a slide and links from the inner terminal of each piece to the slide, a reciprocating rack-rod and connections from each slide to each rod, so that the movement of the former imparts movement to the latter, and an indicating-hand, shaft, and pinion, which latter may mesh with the rack-rod, substantially as and for the purpose described.

411,425. STUFFING-BOX FOR VALVES. RICHARD T. CRANE, Chicago, Ill. Filed Nov. 19, 1888. Serial No. 291,344. (No model.)



Claim.—In a stuffing-box, the combination, with the body A, having recess A' and threaded externally at a', of the cap B, internally threaded to screw thereon and centrally apertured at the top, and the gland C, having a shoulder to rest against the under side of the cap, and having a portion extended through the aperture in the cap and upon the top thereof to form a swiveled connection between the gland and cap, substantially as and for the purpose specified.



411,426. PROCESS OF GENERATING ELECTRICITY BY GAS-BATTERIES. OLOF DAHL, Brooklyn, N. Y. Filed June 17, 1889. Serial No. 314,698. (No model.)

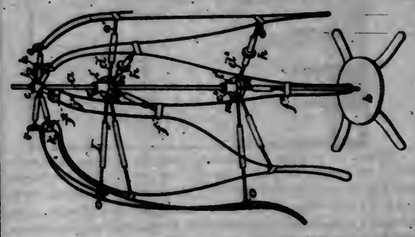
Claim.—1. The process of generating electricity herein described, consisting in, first, raising the temperature of a body of fuel to incandescence by the aid of atmospheric air and utilizing the gases evolved in this operation for fuel and other purposes; second, shutting off the air and admitting steam to the incandescent fuel when it has reached such a temperature that the admitted steam will be decomposed into hydrogen and carbonic acid; third, separating the carbonic acid from the hydrogen by causing hydrate of lime to absorb the carbonic acid, and conducting the hydrogen to one side of a gas-battery or gas-batteries, and, fourth, producing oxygen or equivalent gas and conducting it to the other side of the above-mentioned gas-battery or gas-batteries.

2. The process of generating electricity herein described, consisting in, first, raising the temperature of a body of fuel to incandescence by the aid of atmospheric air, and in utilizing the gases evolved in this operation for fuel or other purposes; second, shutting off the air and admitting steam to the incandescent fuel when it has reached such a temperature that the admitted steam will be decomposed into hydrogen and carbonic acid; third, passing the gases through condensers and purifiers to condense the steam that might have escaped undecomposed and take up possible impurities; fourth, separating the carbonic acid from the hydrogen by causing hydrate of lime to absorb the carbonic acid, and conducting the hydrogen to one side of a gas-battery or gas-batteries, and, fifth, producing oxygen or equivalent gas and conducting it to the other side of the above-mention gas-battery or gas-batteries.

411,427. CONDUIT FOR ELECTRICAL WIRES. CHARLES C. DANIELL, Washington, D. C. Filed Nov. 17, 1888. Serial No. 291,132. (No model.)

Claim.—1. In an electrical conduit, the pipes P, having laterally-projecting lugs p, in combination with the coupling C, having slots c, adapted to register with said lugs, said couplings having an exterior screw-thread upon their free ends, and the ring D having an interior screw-thread adapted to connect said couplings, substantially as and for the purpose described.

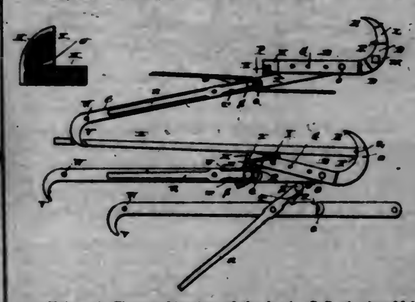
2. In an electrical conduit, the pipe P and the coupling C, removably connected to the end of said pipe, said coupling having laterally-projecting openings E, as and for the purpose set forth.



3. In an electrical conduit, the pipes P P', having the longitudinal holes F, with enlarged ends f, in combination with the tubes A, having lateral branches B, and with the coupling C, having lateral openings E, registering with said lateral branches B in the tubes A, substantially as described.

4. In an electrical conduit, the pipes P P', having the longitudinal holes F, with enlarged ends f, in combination with a coupling for connecting the ends of said pipes and holding them at a distance from each other, and with independent tubes removably connecting said holes F and spanning the space within said coupling, substantially as described.

5. In an electrical conduit, the pipes P P', having the longitudinal holes F, with enlarged ends f, in combination with a coupling for connecting the ends of said pipes and holding them at a distance from each other; and with independent tubes removably connecting said holes F and spanning the space within said coupling, said tubes comprising a lower portion A, adapted to rest in and be supported upon said enlarged ends f, and an upper portion A' shorter than said lower portion, said portions being provided with tongue-and-groove connections, whereby they will be held together when in their normal positions, substantially as described.



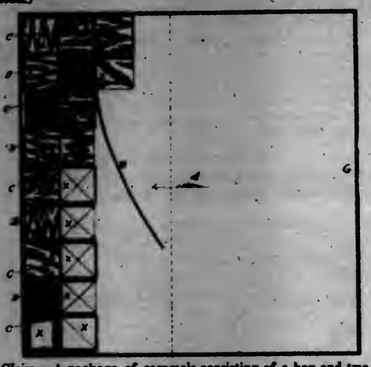
6. In an electrical conduit, the independent tube B herein described, the same comprising a lower half A and an upper half A', both provided with tongue-and-groove devices, whereby they will be held together when in their normal positions, and each carrying half of a lateral projection B, for the purpose set forth, the lower half being longer than the upper half, the whole operating as and for the purposes hereinbefore specified.

411,428. DRESS-FORM. RANDOLPH L. DUNCH, Portland, Me. Filed Nov. 30, 1888. Serial No. 291,613. (No model.)

Claim.—The combination, with collars c c' c^2, sliding on a suitable supporting-standard, said collar c having fixed right threaded arms b, and said collars c' c^2 having pivoted right threaded arms d' d^3, respectively, and flexible ribs united by clips and having fixed left threaded arms e and pivoted left threaded arms e' e^2, of turn-buckles having a right thread in one end and a left thread in the other uniting arms e and d, e' and d', and e^2 and d^3, substantially as and for the purposes set forth.

411,429. FENCE-MAKING IMPLEMENT. CONRAD H. FISHER, Waco, Tex. Filed May 21, 1889. Serial No. 311,507. (No model.)

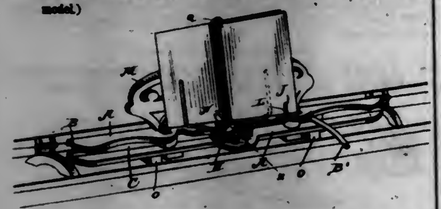
Claim.—1. The combination of the hooks D D, the bar M between the same, the lever pivoted between the said hooks and limited in its movement by the bar M, and provided on its upper side with the offset Q, and the supplemental lever pivoted on the said lever and adapted to clamp a wire against the offset Q, as set forth.



2. The combination of the hooks D D, the bars L M between the same, the plate H, connecting the ends of the hooks and provided with the claw I, the lever pivoted between the hooks and having the offset Q and carrying a supplemental lever, and a lever having one end adapted to be inserted between the hooks D D, and provided on one edge with a stud Y, as set forth.

3. The combination of the body provided at one end with the claw I, having the recess J and groove K, the lever pivoted to the body and having the offset Q, and the supplemental lever adapted to clamp the wire against the said offset, as set forth.

4. The body consisting of the hooks D D, secured together and having their cheeks adapted to lie against one side of the fence-post, and their points adapted to pass around the adjacent side of the post, the said points having the spurs or teeth F at the center of their convexities adapted to take into the body of the post, as set forth.



5. The combination of the body having the claw I, the lever pivoted thereto and having an offset Q, the supplemental lever coacting with said offset, and the lever adapted to engage the body, as and for the purposes set forth.

411,480. CARAMEL-PACKAGE. GEORGE V. PETE and CARL H. KLEINBERG, Chicago, Ill. Filed Jan. 14, 1889. Serial No. 296,947. (No model.)

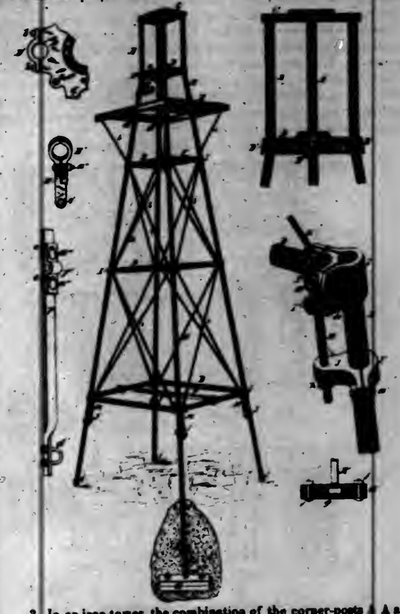
Claim.—A package of caramels consisting of a box and two or more rows of square caramels therein, and the caramels in one row separated laterally by a suitable strip of non-adhesive material which covers the outer edge of every alternate caramel on both sides of the row, and a second row of caramels with another like strip interwoven in the same manner and placed so that the exposed caramels of one side of the first row are covered by the strip of the second row, as specified.

411,481. MUSIC-LEAF TURNER. LOUIS H. FEYHER and FULLER S. DEER, Watsontown, Pa. Filed Feb. 16, 1889. Serial No. 300,118. (No model.)

Claim.—1. The combination of the horizontal parallel base-bars having longitudinal grooves near their rear edges, the swinging levers pivoted between said base-bars and having rack-teeth on their inner ends, and the sliding bar fitted in the grooves in the base-bars, and provided with longitudinal grooves and rack-teeth, the grooves slipping over the teeth on the levers and the teeth acting on the same to operate the levers, as set forth.

2. The combination of the base-bars, the levers pivoted between the same and provided with rack-teeth on their inner ends, and having their outer ends bent upward and provided with vertical longitudinal slots, and the single sliding bar fitted between the base-bars and provided with grooves and rack-teeth to operate the levers, as set forth.

3. The combination of the series of levers having rack-teeth on their inner ends, some of the rack-teeth being thicker than the others, and the sliding bar provided with a series of longitudinal grooves and rack-teeth adapted to engage the teeth of the levers, the grooves being adapted to slip over the thinner teeth of the levers, as set forth.



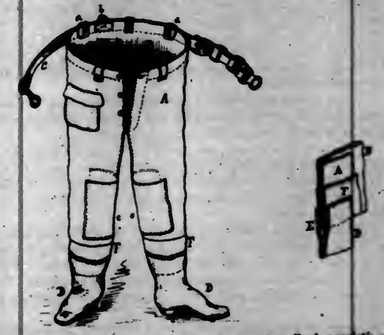
4. The music-leaf turner provided on its under side with the brackets O, as set forth.

5. In a music-leaf turner, the ring Q, adapted to secure the sheets of music together, as set forth.

411,482. IRON TOWER. ISAAC GATES, Marion, Iowa. Filed July 24, 1888. Serial No. 280,869. (No model.)

Claim.—1. In an iron tower, the combination of tubular corner-posts, two-part corner-irons adapted to be clamped tightly upon said corner-posts and having bolts therefor, and projecting studs to receive the ends of tubular struts, struts engaging with said corner-irons, brace-rods connecting with opposite corner-irons diagonally, and a tension device, substantially as described, adapted to draw the whole frame tightly together, the corner-irons at the opposite end of the tower being tight and the intermediate ones loose, as specified.

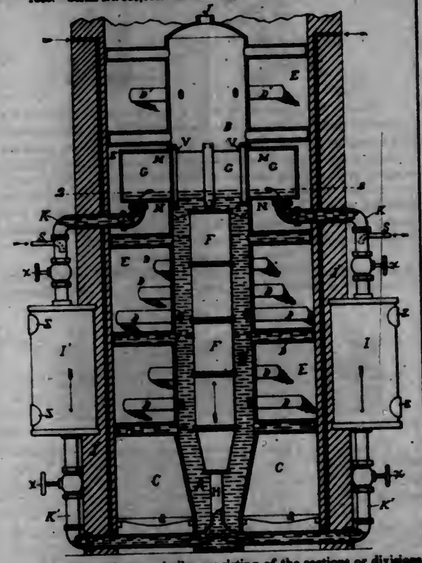
2. The combination, with the corner-post of an iron tower, of the pipe or rod A', having a coupling *j*, and the anchor G, having the inclosed nut *g* engaging with the end of the corner-post, substantially as and for the purpose set forth.



3. In an iron tower, the combination of the corner-posts A A and the step-plate D, having the corner clamp-irons D' D', the socket D'', and the hole D''', substantially as and for the purpose set forth.

4. In an iron tower, the combination of the corner-posts A A, the top plate C, having a central hole therein adapted to form the bearing for the pivot of a windmill, and the step-plate D, secured to said corner-irons by clamp-irons D' D', and having a central socket for the bottom of the pivot, and a hole for the connecting-rod of a windmill, substantially as and for the purpose set forth.

5. In an iron tower, the combination of the corner-irons A and the clamp-irons H H', having a hole *c'* for the shifting-rod of a windmill, substantially as set forth.

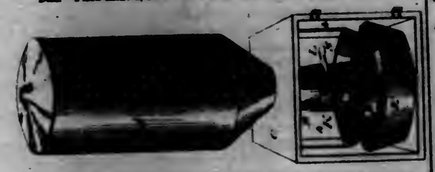


6. In an iron tower of the class specified, the combination, with the struts B B, of the transverse bar F, secured to said struts by clips *d' d'*, and provided with the adjustable stirrup-iron F', substantially as and for the purpose set forth.

411,483. COMBINED TROUSERS AND BOOTS. JESSE A. GLADDING, Bristol, R. I. Filed Nov. 19, 1888. Serial No. 291,941. (No model.)

Claim.—The improved garment herein described, consisting of trousers made of two fabrics, the outer material being oiled cloth and the inner material being woolen cloth and united by seams, the bottom of each trousers-leg having secured thereto a layer of macintosh cloth, in combination with lined rubber boots the lining and outer material of which are separated at the tops thereof, the trousers being united to the boots by inserting and connecting them between their outer material and lining, as set forth.

411,484. STEAM-BOILER. ALEXANDER GRANT, Los Angeles, Cal., assignor of one-half to Michael H. Miller, same place. Filed May 6, 1889. Serial No. 309,807. (No model.)

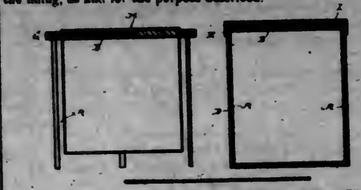


Claim.—1. A steam-boiler consisting of the sections or divisions B B' and enlarged division G, in combination with conduits or pipes K, communicating with the bottom of division G, cylinders I', and pipes K', extending laterally under the grate-bars *a* of the furnace to the bottom section B' of the boiler, as specified.

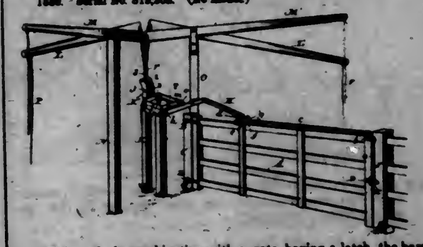
2. In a steam-boiler, the central enlarged division G and sections B B' of the boiler communicating with each other, in combination with pipes or conduits K K' and H, feed-water pipes S S, and water-purifying cylinders I' and F, as and for the purpose specified.

3. In a steam-boiler, the continuous water-conduits outside of the boiler, into which feed-water pipes S S discharge, in combination with the cylinder F, which receives the mixed hot and cold water from said conduits for circulating and purifying the same.

4. In a steam-boiler, exterior water-circulating conduits, connecting the central part of the boiler with the lower part of the same, in combination with the downwardly-discharging feed-water pipes S S, which communicate with said exterior conduits, as specified.



411,485. FLOUR OR MEAL SAFE. LEVI A. HARNEY, Tyndall, Dak. Filed Mar. 2, 1889. Serial No. 301,897. (No model.)



Claim.—In a flour and meal safe, the combination of bin A, tube B, having cone *a* and outlets O O, collar K, having corresponding outlets O' O', stirrers J J on its lower ends, and handle L, agitator H J J, means for attaching to collar K, sieve D, and pan E, whereby the contents of the bin are agitated, discharged, and sifted, successively, substantially as described.

411,486. PROCESS OF CANNING FOOD. JOHN H. J. HAINES, Flushing, N. Y. Filed Nov. 10, 1888. Serial No. 290,481. (Model.)

Claim.—The herein-described method of canning alimentary substances in paper or pasteboard cans having metal-foil linings, consisting in forming the lining and the paper or pasteboard body separately, inclosing the material in the metal foil, sealing the same by fusion of the metal-foil edges together, subjecting the lining and contents to the proper heat, and, finally, applying the body of the can to the lining, as and for the purpose described.

411,487. GATE. CARSTEN HARMS, Morgan, Iowa. Filed July 30, 1888. Serial No. 319,302. (No model.)

Claim.—1. In combination with a gate having a latch, the bars H I, serving to operate the latch, the lazy-tongs connected with the bars H I, and a pair of levers L M, connected with and serving to operate the lazy-tongs.

2. In combination with a gate having a latch, bars H I, serving to actuate the latch, lazy-tongs connected with the bars H I, levers L L' M M', arranged in pairs, and chains or cords *t* and *s*, connecting the lazy-tongs with the levers.

3. In combination with a gate having a latch, post or standard J, bars H I, serving to operate the latch and connected with a swivel-collar A, secured to the post or standard, lazy-tongs connected with bar I by means of a swivel-block *o*, levers L M, and connections between the levers and lazy-tongs.

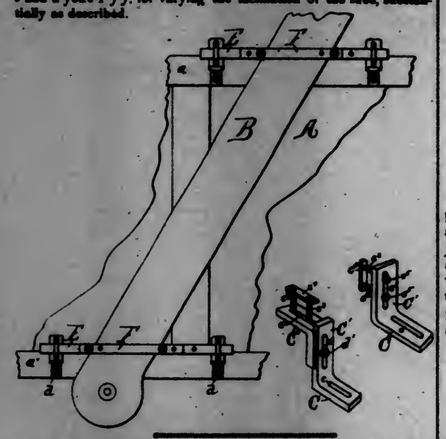
4. In combination with a gate having a latch, post or standard J, bars H I, mounted upon the post and connected with and serving to actuate the latch, bracket K', bars *k l*, pivotally connected with the bracket, bars *m n*, pivotally connected with bar I and with the bars *k l*, levers L M, and chains or cords connecting the levers with the arms *l m*.

5. In combination with gate A, having latch D, post or standard J, bars H I, mounted upon the standard and connected with the latch through intermediate mechanism, bracket K', bars *k l m n*, arranged substantially as shown, arms *p q*, secured to bars *l m*, levers L M, and chains *r s*, all arranged substantially as shown.

6. In combination with gate A and latch D, block or arm *d*, mounted upon the gate and connected with the latch, arms H I, connected, respectively, with the arm *d* and a post or standard J, bracket K', bars *k l m n*, connected in pairs with each other and with the bracket and arm I, levers L M, and chains or cords *r* and *s*.

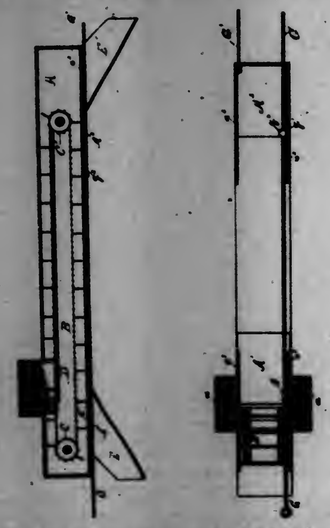
411,488. ELEVATOR ATTACHMENT FOR GRAIN-SEPARATORS. STACY B. HARE, Peoria, Ill., assignor to the Hart Weigher Company, same place. Filed Aug. 24, 1888. Serial No. 283,689. (No model.)

Claim.—1. A clamping device consisting, essentially, of the doubly-slotted angle-irons C C', the longitudinally-movable bar E, supported by said angle-irons, a yoke for clamping ends of the bar to the angle-irons, and a yoke for clamping the elevator-tube to the bar, substantially as described, whereby said tube may be adjusted vertically, laterally, and longitudinally with respect to the supporting-structure, as herein set forth.



2. The combination of the brackets C C', provided with a clamping device c^3 c^4, and the bar E, as and for the purpose stated.

3. The combination of the brackets C C', provided with a clamping device c^3 c^4, and the bar E and yoke F *f f*, as and for the purpose stated.



4. The combination of brackets made up of the parts C, C', and C², and provided with a clamping device c^3 c^4, and the bar E and yoke F *f f*, as and for the purpose stated.

5. The combination of an elevator-tube with a clamping-bar E, arranged at or near its end, adjustably secured to the frame of a grain-separator, so as to be capable of a lateral adjustment with relation to

the frame of said grain-separator, and provided with a series of holes *e* and a yoke *F f f*, for varying the inclination of the tube, substantially as described.

411,439. GRAIN-CONVEYER. STACY R. HAHN, Peoria, Ill., assignor to the Hart Weigher Company, same place. Filed Dec. 21, 1888. Serial No. 294,346. (No model.)

Claim.—1. The conveyer-tube A, provided with the pulleys C C', carrying an endless conveyer-chain B continuously in the direction which will move the grain upon the bottom of the tube from the pulley C to the pulley C', said tube having the outlets a' a^3 practically at its opposite ends, but between the pulley C and the end opposite, and provided with means for closing them at will, in combination with a spout adapted to deliver grain upon the bottom of the tube between the pulley C and the opposite edge of the adjacent outlet a', as and for the purpose stated.

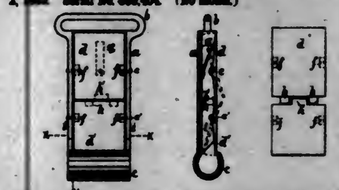
2. A conveyer-tube having the pulleys C C', chain B, outlets a' a^3, valves A' A^3, the partition D, stopping short of the pulley C sufficient to allow the grain to drop between it and said pulley, and a spout adapted to deliver grain upon said partition, substantially as and for the purpose set forth.

3. The combination of the conveyer-tube and the valves A' A^3, with the rod G, rigidly attached to valve A' and bearing a lug g' engaging with a stop g^3 upon valve A^3, to open the same when valve A' is closed, but disengaging from said stop when the rod G is moved in the opposite direction, as and for the purpose stated.

411,440. HEEL-SWEEP ATTACHMENT. JONAIAH B. HEARN, Dryden, S. C. Filed Oct. 26, 1888. Serial No. 289,116. (No model.)

Claim.—The combination, with a slotted plow-standard, of the perforated plate *c*, fitting against the rear face of the said standard, and having the tongue *f*, fitting in the slot of said standard, and then *f'*, turning over the front edge of said standard, perforated plate *b*, adapted to fit against the rear face of the said plate *c*, and having the threaded opening *h*, threaded and headed pin *i*, working in the threaded opening *h*, its headed end turning in the perforation *g* of plate *c*, and sweep *a*, bolted to the rear of said plate *b*, substantially as shown and described, and for the purposes set forth.

411,441. APPARATUS FOR MOLDING SASH-WEIGHTS, &c. ALONZO S. HANSON, Chelsea, Mass. Filed Feb. 19, 1885. Renewed Mar. 2, 1889. Serial No. 301,515. (No model.)



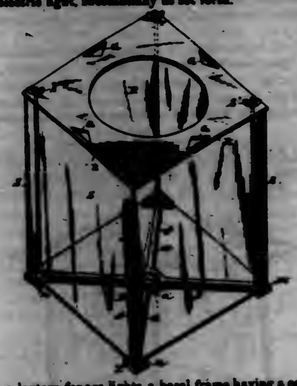
Claim.—1. In a mold for casting sash-weights, the weight-patterns *c c c*, with the cutting-off patterns *i i* and thimbles *n n'*, in combination with the gate-pattern *d*, with the shutting-off pattern *h* and sprue-pattern *g*, all arranged as described, for the purpose set forth.

2. In a mold for casting sash-weights, the weight-patterns *c c c*, in combination with the cutting-off patterns *i i* and thimbles *n n*, having chambers *n' n'*, for holding the eye of the weight while it is being cast, as and for the purpose set forth.

3. In a mold for casting sash-weights, the gate-pattern *d*, in combination with the sprue-pattern *g* and shutting-off pattern *h*, as and for the purpose set forth.

4. In a mold for casting sash-weights, gate-pattern *d*, with the sprue-pattern *g* and shutting-off pattern *h*, in combination with the weight-patterns *c c c* and thimbles *n n*, provided with the chambers *n' n'*, for the purpose set forth and described.

411,442. SNAP-HOOK. HANS HELVIE, Chicago, Ill. Filed May 2, 1888. Serial No. 272,404. (No model.)



Claim.—1. In a snap-hook, the body *a*, provided with hook *c*, in combination with the spring *g* and levers *d d'*, fulcrumed at *e f'*, the abutting ends of said levers being united by a joint which permits longitudinal separation of said ends, substantially as specified.

2. In a snap-hook, the body *a*, provided with sides *i* and hook *c*, in combination with the spring *g*, levers *d d'*, fulcrumed at *e f'* on said walls and provided with spurs *h h'* at their abutting ends, substantially as specified.

3. In a snap-hook, the body *a*, provided with hook *c*, in combination with the abutting levers *d d*, fulcrumed at *e f'*, and provided with lugs *f f'*, and spurs *h h'* at the abutting ends of said levers, whereby their abutting ends must move together and may separate longitudinally when in operation, substantially as specified.

411,448. GLOBE-FRAME. DAVID HYMAN, Harrisburg, Pa., assignor of one-half to Joshua W. Jones, same place. Filed July 26, 1888. Serial No. 281,157. (No model.)

Claim.—1. A lantern for arc electric lights, consisting of a bonal frame or spider having central hub provided with an eye for attaching the lantern to the shank of the lower-carbon holder by a screw, said hub having radial arms provided with grooves adapted to sustain therein the bottom edges of panes of glass, as the lantern sides, a top plate having devices for securing the upper edges of the panes, and wire rods inserted through the top plate and through the spider's arms, the wire rods having hooks beneath and screw-nuts at upper end for connecting the plates squarely, all combined and arranged about the electric light, substantially as set forth.

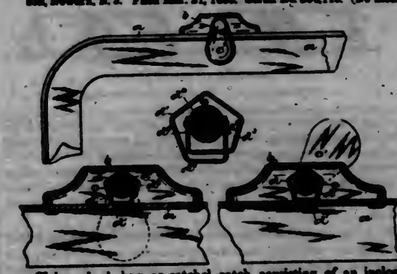
2. In a lantern for arc lights, a bonal frame having a central hub, a central eye K, and radial arms provided with flanges *a'*, palms *n'*, and recess n^3, in combination with the removable bottom sections Z, each adapted to rest on the flanges *a'* and in recess n^3, substantially as described.

3. The skeleton globe-frame having the bonal frame A *a'* H as its support at corners thereof only, the sides S, retained at their bonal edges in the groove *n* independent of the bottom, the top plate Q, having the exterior flanges *h*, and the interior struck-up tongs G, for resting on and embracing the lantern-sides, and the screw-bolts N, arranged in the corners inside of the glass sides, all combined and adapted substantially as and for the purposes shown and described.

4. The globe-frame consisting of the central hub having an eye and set-screw or set-screws L, and the radial arms A, provided with flanges *a'*, abutting toward the center, and the grooved palms *n'* on their ends, the removable bottom sections Z, constructed to rest upon the flanges *a'* and extending beyond the lantern-sides and below the bottom of the grooves in the palms, the sides S, retained in the grooves *n* and covering the sections Z, the top plate Q, provided with parts for holding the sides in position, and the bolts N, for securing said top plate to said radial arms, substantially as described.

5. A globe-frame for electric-arc light, composed of rectangular panes of glass for the sides of the said frame, a spider or bottom frame having a central hub adapted for attaching it to the metal carbon-holder, having radial arms extending from said hub to the sides, each formed at its extremity with a palm having its upper side provided with grooves adapted for retaining therein the bases of said sides, said arms having also lateral flanges to hold thereon glass segments which form a transparent bottom, and a top frame constructed to hold erect said sides, it having parts for bearing interiorly against the sides, and other parts for bearing against the sides exteriorly, and screw-bolts connecting said palms with said top frame, arranged inside near the intersection of the sides, substantially as shown and described.

6. The combination of an electric-light frame, a spider or bottom frame, the glass sides resting upon said spider or bottom frame, and a top frame for securing the tops or upper ends of the glass sides and having an opening in the center for the electric-light frame which supports the spider or bottom frame, substantially as described.



411,444. MICROMETER-CALIPERS. JOHN H. HOBBS, Atlantic, Iowa. Filed Apr. 30, 1889. Serial No. 308,941. (No model.)

Claim.—1. The frame, the threaded rod which passes through a threaded aperture in its support adapted to receive it, the circular jaw having a longitudinal and revolving motion, which is secured to the inner end of the threaded rod, the stationary-jaw stem or shank which enters an aperture in its support adapted to receive it, and the circular stationary jaw which is secured to the inner end of its stem or shank and which extends upward above its support, the movable circular jaw being constructed of larger diameter than the threaded rod to which it is secured and by which it is actuated, and the stationary jaw being constructed of larger diameter than its stem or shank, thereby providing means for taking the gage of internal diameters and spaces as well as external diameters, all combined substantially as described and shown.

2. Calipers provided with a movable circular jaw having a longitudinal and revolving motion and being of greater diameter than the rod to which it is secured and by which it is actuated, substantially as described.

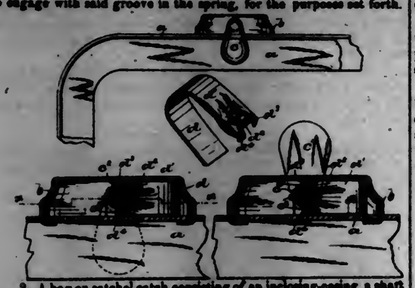
411,445. CATCH FOR BAGS, SATCHELS, &c. RICHARD C. JENKINS, Newark, N. J. Filed Mar. 21, 1888. Serial No. 268,119. (No model.)

Claim.—1. A bag or satchel catch consisting of an inclosing-casing, a shaft or locking-bar pivoted in said casing, having ears on the opposite ends thereof which embrace the frame-sections of the bag, and a spring secured to said shaft and encircling the same and engaging with the top of the frame-section of the bag to hold the ears on said locking-bar or shaft in their locked or unlocked positions, for the purposes set forth.

2. A bag or satchel catch consisting of an inclosing-casing, a shaft or locking-bar pivoted in said casing, having ears on the opposite ends thereof which embrace the frame-sections of the bag, and an angular or polygonal spring encircling said shaft or bar, one of the sides of said spring engaging with the top of the bag-frame to hold the ears on said locking-bar in their locked or unlocked positions, for the purposes set forth.

3. A bag or satchel catch consisting of an inclosing-casing, a shaft or locking-bar extending therethrough, having ears on the opposite ends thereof which engage with the frame-sections of the bag, a spring encircling said shaft and engaging with the top of the frame-section of the bag to hold the ears on the ends of the locking-bar in their locked or unlocked positions, said spring being formed from a plate *d*, having a perforation d^2 therein and an arm d^3, said arm projecting through the perforation d^2 when in position around the shaft, and means for securing the spring to the shaft, for the purposes set forth.

4. A bag or satchel catch consisting of an inclosing-casing, a polygonal spring within the casing, and a shaft *c*, secured to said spring and pivotally supported by said spring, and ears *c'* on the opposite ends of said shaft, said ears being held in their locked or unlocked positions by means of said spring, said spring engaging with the top of the frame-sections, for the purposes set forth.



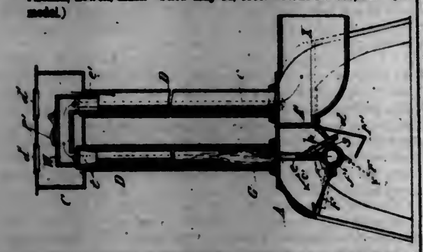
5. The combination, with the frame-section of a bag, of a fastening device consisting of an inclosing-casing, a shaft pivoted within said casing, having ears on the opposite ends thereof which engage with the frame-sections of the bag, a polygonal or cylindrical spring within said casing, said spring encircling the shaft, any one side of said spring engaging with the top of the frame-section of the bag to hold said ears on the locking-bar in their locked or unlocked positions, and means for securing the casing to the bag-frame, for the purposes set forth.

6. The combination, with the frame-section of a bag, of a fastening-catch consisting of a casing *b*, a shaft *c*, pivoted in said casing, having ears on the opposite ends thereof which engage with the frame-sections of the bag, a polygonal or cylindrical spring within said casing encircling the shaft, any one side of said spring engaging with the top of the frame-section of the bag to hold said ears on the locking-bar in their locked or unlocked positions, and means for securing said spring to the shaft or turning-bar, for the purposes set forth.

411,446. SPRING-CATCH FOR BAGS, SATCHELS, &c. RICHARD C. JENKINS, Newark, N. J. Filed Mar. 22, 1888. Serial No. 268,267. (No model.)

Claim.—1. A bag or satchel catch consisting of an inclosing-

casing, a spring arranged within the casing and provided with a groove or furrow, as set forth, and a shaft pivoted in said casing, having ears on the opposite ends thereof which embrace the frame-sections of the bag, and pins or stops arranged around said shaft and adapted to engage with said groove in the spring, for the purposes set forth.



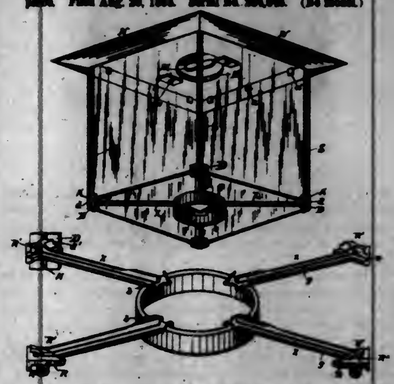
2. A bag or satchel catch consisting of an inclosing-casing, a shaft or locking-bar extending therethrough, having ears on the opposite ends thereof, which engage with the frame-sections of the bag, pins c^2 thereon, substantially as shown, and a U-shaped spring arranged within the casing on one side of said bar or shaft, said spring being provided with a groove d^3 and chamfered corners d^4 and d^5, for the purposes set forth.

3. A bag or satchel catch consisting of an inclosing-casing, a shaft or locking-bar extending therethrough, having ears on the opposite ends thereof which engage with the frame-sections of the bag, pins c^2 thereon, substantially as shown, and a U-shaped spring arranged within the casing on one side of said bar or shaft, said spring being provided with a groove d^3 and chamfered corners d^4 and d^5, one of said pins c^2 normally engaging with the groove, and the other pin being adapted to engage with the chamfered corners on the spring when the locking-bar is caused to rotate on its axis, thereby causing the disengagement of the pin from the groove in the spring, substantially as and for the purposes set forth.

4. A bag or satchel catch consisting of an inclosing-casing, a shaft or locking-bar extending therethrough and having ears on the opposite ends thereof which engage with the frame-sections of the bag, and a U-shaped spring arranged on one side of the bar or shaft, one arm of said spring being provided with means adapted to engage with pins or stops arranged on and around the locking-bar to retain said bar in its fastened or unfastened position on the bag-frame, for the purposes set forth.

5. The combination, with the frame-section of a bag, of a fastening device consisting of an inclosing-casing, as set forth, and a shaft or bar pivoted in said casing, having ears on the opposite ends thereof which engage with the frame-sections of the bag, pins c^2 on said shaft, which engage with chamfered corners d^4 and d^5 and a groove d^3 in a spring d, thereby causing the fastened or unfastened engagement of the ears c' on the locking-bar with the frame-sections of the bag, and means for securing said casing to the bag-frame, as set forth.

411,447. GAS-HEATER. JONATHAN JOHNSON and RICHARD H. PARKER, Lowell, Mass. Filed May 10, 1889. Serial No. 310,292. (No model.)



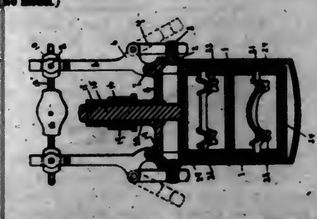
Claim.—1. As an improvement in gas-heaters, the combination of the radiating-pipes, the two-chambered base to which they are connected, the rotating burners provided with an arm to rotate the same, the stops attached to the base to limit the movement of the arm, the stationary finder secured to the base, and the finder secured to the rotating pipe turning with the same, substantially as and for the purpose set forth.

2. The combination of the burner-chamber in the base, the chamber in the top, the front radiating-pipes connecting said chambers, the bottom chamber leading to the flue, the rear radiating-pipes connecting said chamber leading to the flue and the top chamber, the elbows connecting the tops of the front and rear radiating-pipes, one end of said elbows completely filling the upper end of the front pipe, to which it is attached, and having an annular space surrounding the end that enters a rear pipe, substantially as and for the purpose set forth.

3. As an improvement in heaters, the elbows provided with a relief-valve upon their upper sides, in combination with the radiating-pipes connected by said elbows, substantially as and for the purpose specified.

4. As an improvement in gas-heaters, the combination of the radiating-pipes, the chamber which receives their upper ends, said chamber provided with perforations opposite the ends of the pipes, and the covers for said perforations adapted to be thrown off and relieve the chamber in case of explosion therein, substantially as set forth.

411,448. GLOBE-FRAME FOR ELECTRIC-ARC LIGHTS. JOSHUA W. JONES, Harrisburg, Pa., assignor of one-half to David Hyman, same place. Filed Aug. 20, 1888. Serial No. 284,048. (No model.)



Claim.—1. In an electric-light globe-frame, the combination of the basal frame W, provided with arms X, formed with lateral flanges g, and having end abutments R, and having also the shoulders R' offset near their ends, with the plates D, attached to said abutments by screws d in slots K in said plates, and the sides Z, retained on said abutments by said plates and between the parts Q Q' on the outer side of the globe-frame top by the aid of the bolts S, joining said basal frame to the top plates, substantially as and for the purposes set forth.

2. In an electric-light globe-frame, in combination with a reflector A, made with the projections A^2 and the cut-away space A' between said projections and retained in position between the top and bottom parts of the globe-frame in lieu of a transparent side of globe, substantially as and for the purposes set forth.

3. In an electric-light globe-frame, the combination of the basal part W, adapted for supporting thereon the bottoms of the glass sides of the globe in connection with the slotted plates D, secured in position by screws d, the diaphragm top plate V, provided with parts adapted for embracing the tops of said glass sides, the lids L, having parts set away at M M' and fitted to fold together free of the carbons, screw-rods connecting said basal part with said top plate, and means connecting detachably said basal part W with the carbon-holder, so that the globe-frame may be readily removed when said lids are opened, substantially as shown and described.

411,449. DENTAL VULCANIZER. JOHAN G. KELLER and DAVID B. WEIMER, Fort Wayne, Ind. Filed May 3, 1889. Serial No. 309,542. (No model.)

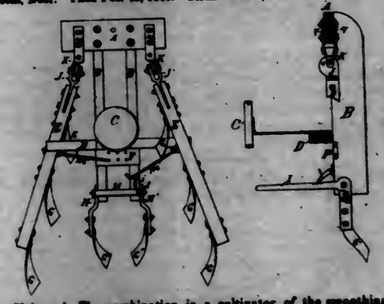
Claim.—1. In a dental vulcanizer, the combination, with the steam-pot 1, provided with lugs 2, and a lid 3, provided with lugs 7 and 18, of the locking-link 4 and the actuating-levers 8, hinged to the lid 5, as and for the purposes set forth.

2. In a dental vulcanizer, the combination, with the steam-pot 1, provided with lugs 3, lid 5, provided with lugs 7 and 18, and locking-link 4, of the actuating-levers 8, hinged to the lid 5 and provided with lugs 6 and slots 9, as and for the purposes set forth.

3. In a dental vulcanizer, the combination, with the steam-pot 1, provided with lugs 2, lid 5, locking-links 4, and levers 8, provided with lugs 6 and slots 9, of the locking-nuts 10, pivoted in slots 9 by set-screws 11, as and for the purposes set forth.

4. In a dental vulcanizer, the combination of a steam-pot 1, provided with lugs 3, lid 5, provided with lugs 7 and 18, actuating-levers 8, provided with lugs 6 and locking-nuts 10, locking-rod 12, provided with insulated handle 13, and locking-link 4, all formed substantially as described, as and for the purposes set forth.

5. In a dental vulcanizer, the combination, with a steam-pot 1, provided with lugs 3, and a cover 5, provided with upwardly-projecting lugs 7 and downwardly-projecting lugs 18, and a sleeve 20, provided with a collar-nut 16 and rubber-packing space 19, of the stirrup 24, provided with a piston 15, said piston passing through the lid 5, sleeve 23, rubber packing 19, and collar-nut 16, and secured thereto by a closing-nut 17, as and for the purposes set forth.

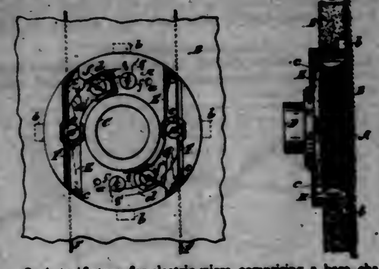


6. In a dental vulcanizer, the combination of the pot 1, the lid 5, provided with lugs 7 and 18, and sleeve 23, levers 8, locking-rod 12, locking-links 4, and stirrup 24, provided with a piston-rod 15, secured in position by nuts 16 and 17, as and for the purposes set forth.

411,450. PENCIL-CLASP. GEORGE H. KNIT, Cambridge, Mass. Filed Apr. 29, 1889. Serial No. 308,616. (No model.)

Claim.—A pen and pencil holder consisting of a ring having thereon arms extending outward and upward, of flexible material, so that when pressure is brought to bear thereon they will turn backward, substantially as and for the purpose above described.

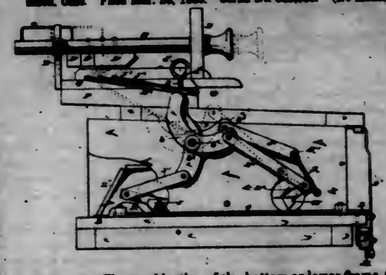
411,451. LISTING-CULTIVATOR. WILLIAM A. KNEDLER, Lincoln, Nebr. Filed Feb. 15, 1889. Serial No. 299,909. (No model.)



Claim.—1. The combination, in a cultivator, of the smoothing-plank A, runners B B, arms E E, attached to the plank A by means of the double coupling composed of parts K and J, knives G, cross-piece D, adjusting-plate F, and cast C, all substantially as described.

2. The combination, in a cultivator, of the smoothing-plank A, runners B B, arms E E, attached to the smoothing-plank by means of the double coupling composed of the parts K and J, shovels G, cross-piece D, adjusting-plate F, adjusting-rods m, cast C, shovels G' G', attached to the runners B B by means of the arch H and shoulder H' H', and raised or lowered by means of the lever I, all substantially as described.

411,452. INCANDESCENT ELECTRIC-LIGHT FIXTURE. PHILIP H. KLEIN, Jr., New York, N. Y., assignor to the Bergmann & Company, same place. Filed May 20, 1889. Serial No. 312,098. (No model.)

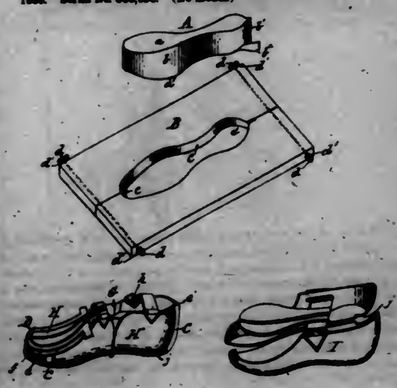


Claim.—1. In combination with the main wires, a tap-fixture comprising a base having channels and binding-plates and screws seated in said channels, lugs on the base to engage the plaster of a wall, and a central opening to engage over a pipe-connection, substantially as specified.

2. A tap-fixture for electric wires, comprising a base, channels in said base, channels at approximately right angles from the first-named channels, binding-plates in the channels, binding-screws for the main wires, and binding-screws for the branch wires, the said base having a central opening to engage over a gas-pipe connection, substantially as specified.

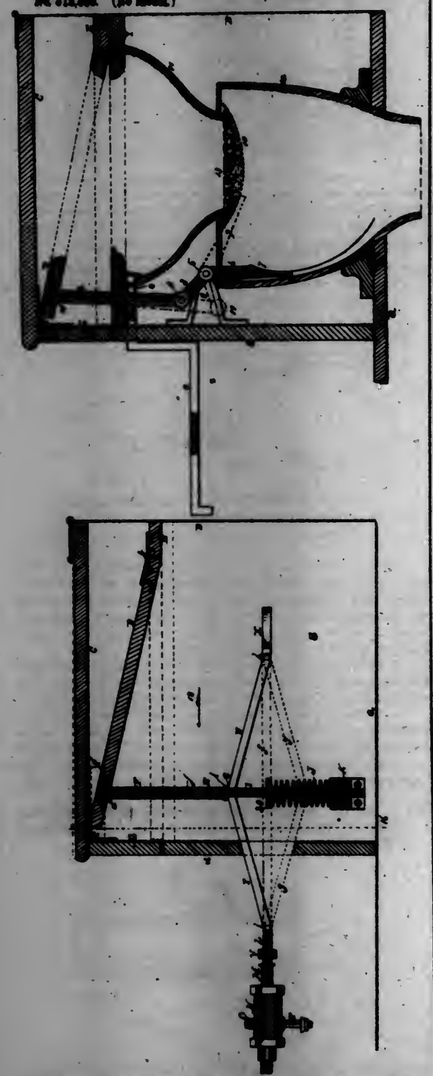
3. A tap-fixture for electric wires, comprising a base, channels extending across said base, channels at approximately right angles to the first-named channels, binding-plates in the channels, binding-screws for the wires, and a safety-catch, the said base having an opening to engage over a gas-pipe connection, substantially as specified.

411,453. STOP-MOTION FOR REED-ORGANS. JOHN LANE, Massillon, Ohio. Filed Mar. 30, 1889. Serial No. 305,399. (No model.)



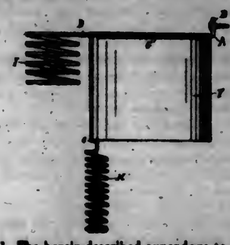
Claim.—1. The combination of the bottom or lower frame A, the top or upper frame consisting of the stop-board B, the lever-board C, and the guide-board D, the stops E, provided with the staples a and the operating-blocks F, the levers F^0, I^0, and J^0, and the segmental bars b' b^2, and b^3, located side by side and upon the pin or bar b, substantially as and for the purpose specified.

2. The combination of the bottom or lower frame provided with the thumb-screws d', the lever-board provided with the slots d, and the stop-blocks d^3, substantially as and for the purpose specified.



3. The combination of the bottom or lower frame having independently attached thereto the knee-swell lever L, adapted to elevate the front and rear swell-boards L', the section-bar N, having attached thereto the lever-bars O and adapted to elevate the mute-bars H and I independent of stops, substantially as and for the purpose set forth.

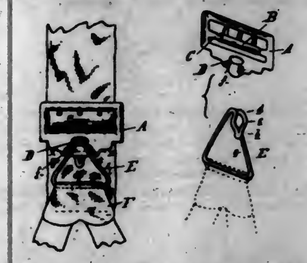
411,454. MANUFACTURE OF WIGWAM SHOES OR SLIPPERS. ERNEST L. LABRADOR and DAVID PUTNAM, Peabody, Mass. Filed Apr. 26, 1889. Serial No. 308,694. (No model.)



Claim.—The improved method of manufacturing wigwam or other similar shoes or slippers, consisting in molding the leather in a wet and pliable condition, then lasting the same and inclosing the lasted shoe in a close-fitting mold or former, and finally stitching the shoe while so held.

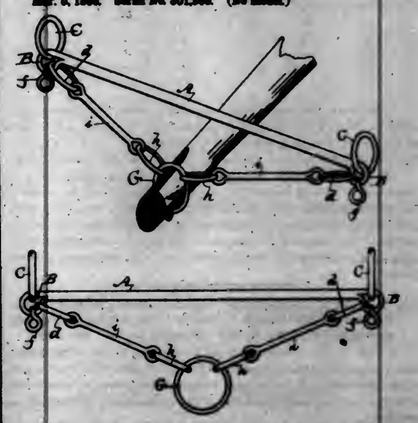
411,455. WATER-CLOSET. LOUIS LAVIAN and HERMAN TRIPP, Chicago, and JOHN FAHLSTEN, Austin, Ill. Filed June 1, 1889. Serial No. 312,803. (No model.)

Claim.—An improvement in water-closets for cars, consisting of two struts T and U, jointed together at the inner elevated ends, the strut U, jointed to a fixed support, and the outer end of strut T, jointed to a plunger which operates through a guide, in combination with a water-closet valve whose piston is operated by said plunger, and an oscillating cent provided with a jointed rod-connection which extends through the struts and is provided with a collar operating against them and a collar operating against a spring, a coil, a pan below it, and a water-pipe O, communicating with the valve and the bowl, as specified.



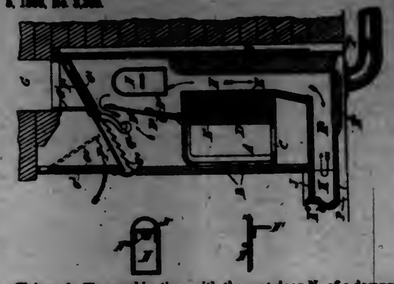
411,456. ATTACHMENT FOR WRITING-DESKS. EDWARD LANGHAM, Toledo, Ohio. Filed Dec. 20, 1888. Serial No. 294,191. (No model.)

Claim.—1. The herein-described appendage to a desk, consisting of two depending coils and a sponge-receptacle having a telescoping portion provided with a foraminous covering, as and for the purpose set forth.



2. In an appendage to a desk, in combination with a hanger, a sponge-receptacle provided with a telescoping top portion having a foraminous covering, as and for the purpose set forth.

411,457. BUCKLE. ASHER H. LARSEN, Preston, Mich., assignor of one-half to Walter W. Hilliard, same place. Filed May 20, 1889. Serial No. 312,094. (No model.)



Claim.—In suspenders, the combination, with the buckle having the oval-shaped aperture, of the loop having the lower triangular portion bent inwardly at the upper end, then outwardly and terminating in a recessed end, the upper end being bent to form a hook and the outward-bent portion serving to retain the loop in the buckle, substantially as described.

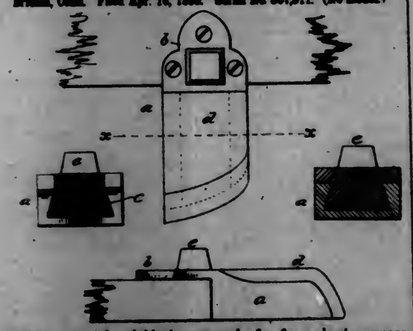
411,458. NECK-YOKE. WILLIAM LEES, Grenola, Iowa. Filed Mar. 5, 1889. Serial No. 301,969. (No model.)

Claim.—An improved neck-yoke composed of a bar A, having integral loops B, in which are inclosed rings C, *d*, and *f*, and the ring G, connected with the ends of the bar by means of rings *d* and A, links *i*, and the loops B, substantially as shown and described, for the purposes stated.

411,459. STOVE. HIRAM LOVE, Cambridge, England. Filed Jan. 21, 1889. Serial No. 297,313. (No model.) Patented in England Mar. 8, 1888, No. 3,923.

Claim.—1. The combination, with the seat-door N, of a damper or baffle plate N', substantially as herein described, and illustrated in the accompanying drawings.

2. A fire-place stove having the fire-place, the back plate of which is provided with slots B and D', the latter being regulated by a damper, the combustion-chamber in rear of the back plate, the divided flue K below the fire-place, and the flues L, connecting with the chimney, substantially as set forth.

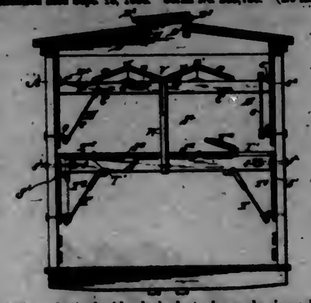


411,460. CAR-COUPLING. PATRICK T. HARRIGAN, Troy, N. Y. Filed May 1, 1889. Serial No. 309,194. (No model.)

Claim.—1. The combination, with the draw-head D, made with the slot T in its upper surface, the opening O in its bottom, and having the downwardly and rearwardly sloating bearings b^3, of the connecting-pin P, made with the downcast end p', its shank or body part p^2, tail-piece p^3, and having the trunnion-form journals J at each side thereof, and the chain C, connecting the shank of said pin with the crank K^2, arranged on the shaft S^2, having on its outer end the crank K', constructed and arranged to operate substantially in the manner as and for the purpose set forth.

2. The combination, with the draw-head D, made with the top slot T, the opening O, made in its bottom, and having the slotted and rearwardly-sloating bearings b^3 in its sides, of the connecting-pin P, made with the downcast outer end p', the shank or body part p^2, the tail-piece p^3, and having the trunnion-form journals J at each side thereof, the chain C, connecting with the shank of said pin, the shaft S^2, having thereon the cranks K' and K^2, with the latter connecting with the outer end of said chain, and the link L, constructed and arranged to operate substantially in the manner as and for the purpose set forth.

411,461. DRIVER'S BENCH-BLOCK. BROWN B. HARRIS, New Britain, Conn. Filed Apr. 16, 1888. Serial No. 307,011. (No model.)

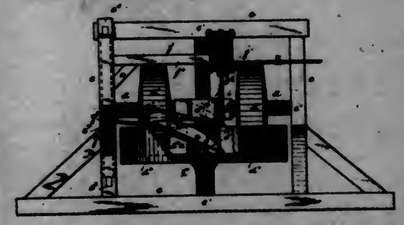


Claim.—1. A bench-block composed of a frame having means for connection to a bench and provided with removable working-surface of non-metallic material, all substantially as described.

2. A bench-block composed of a frame of metal and having a socket in the projecting part of the frame, in combination with the removable working-surface formed of rubber or like soft material, all substantially as described.

3. In combination, in a bench-block, the frame having the anvil and the projecting part with a socket and the removable working-surface formed of soft material with the outer end cut at an angle, all substantially as described.

411,462. STOCK-CAR. ALONZO C. HAYNES, Chicago, Ill. Original application filed Jan. 12, 1889, Serial No. 291,102. Divided and this application filed Sept. 16, 1889. Serial No. 323,726. (No model.)



Claim.—1. A double-decked stock-car having a bottom floor, sides, and a roof, and provided about midway between the bottom floor and roof with removable cross-beams S, detachably secured to the sides of the car, and a removable flooring on the cross-beams, a storage-chamber D, located in the top part of the car, and feed-racks located along the interior and on opposite sides of the car above and below the said removable flooring and cross-beams, substantially as shown and described.

2. A double-decked stock-car having a bottom floor, sides, and a roof, and provided about midway between the bottom floor and roof with removable cross-beams S, detachably secured to the car-sides, a removable flooring on the cross-beams, storage-chamber D in the top part of the car, a grain-trough or bin V, and feed-chutes W, leading from the trough or bin to the center of the lower deck of the car, substantially as shown and described.

3. A double-decked stock-car having a bottom floor, sides, and a roof, and provided about midway between the bottom floor and roof with removable and replaceable cross-beams detachably secured to the car-sides, a removable flooring on the cross-beams, and feed-racks along the interior on opposite sides of the car above and below the said cross-beams and flooring, substantially as shown and described.

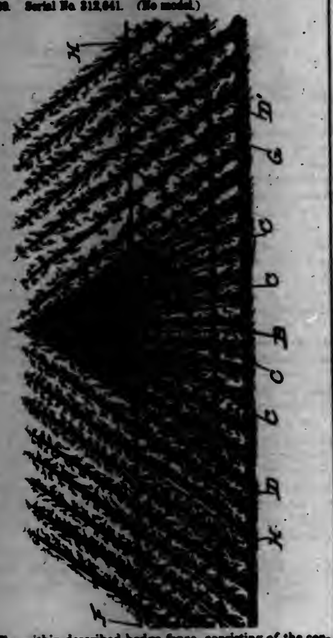
4. A double-decked stock-car having a bottom floor, sides, and roof, and provided about midway between the bottom floor and roof with removable cross-beams S, detachably secured to the car-sides, a removable flooring S^3 on the cross-beams, a storage-chamber D in the top part of the car, a grain trough or bin V, a feed-chute W, leading from the trough or bin to the center of the lower deck, feed-racks E above the removable flooring, and feed-racks T below the latter, substantially as described.

411,463. SCOOP FOR CLAY OR ORE MILLS. EDWARD J. HILLMAN, Black Lick, Pa. Filed Jan. 30, 1889. Serial No. 298,009. (No model.)

Claim.—1. In combination with a clay or ore mill having a rotating pan, a scoop supported on a movable frame in position to be carried over and withdrawn from the frame and to permit the scoop to be lowered into the pan, and a power-operated piston or other lifting device for lowering the scoop into the pan and raising it therefrom, substantially as and for the purposes set forth.

2. In combination with a clay or ore mill having a rotating pan,

a crane swinging over the pan and carrying a scoop and a power-operating piston or other lifting device supported on the crane for lowering the scoop into and raising it from the pan, substantially as and for the purposes set forth.



3. In combination with a clay or ore mill having a rotating pan, a scoop supported on a movable frame in position to be carried over and withdrawn from the pan, said scoop being journaled on the frame so as to be swung thereon for unloading, substantially as and for the purposes set forth.

4. In combination with the clay or ore mill having a rotating pan, the crane or movable frame *f*, carrying the cylinder or lift at its end, the rod *g*, pivoted to the crane, the scoop *e*, and the bent arm *h*, connected to the lifting device, substantially as and for the purposes set forth.

5. In combination with the clay or ore mill having a rotating pan, the crane or movable frame *f*, carrying the cylinder or lift at its end, the rod *g*, the scoop *e*, journaled thereon, and the bent arm *h*, connected to the lifting device and having the lower arm *h'* supporting the scoop, substantially as and for the purposes set forth.

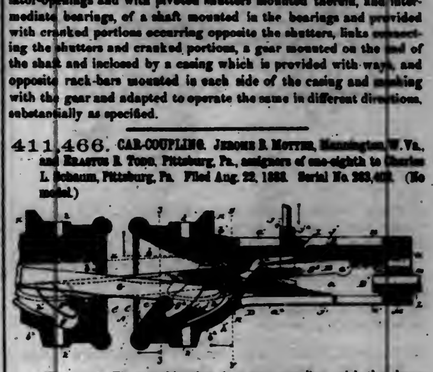
6. The combination, with the clay or ore mill, of the scoop, the power-operated piston or other lifting device, and the hook *k* and pin *l*, for supporting the scoop when not in use, substantially as and for the purposes set forth.

411,464. HEDGE. PEARIS M. MEMLER, Hagerstown, Md. Filed May 20, 1889. Serial No. 312,041. (No model.)

Claim.—The within-described hedge fence, consisting of the central triangular section formed of inclined stalks, in combination with the stalks D D', inclined toward said central section, the two horizontal wires, and the diagonal tie-wires looped to said horizontal wires, all as shown and described.

411,465. TRANSOM-LIFTER. CHARLES C. MITCHELL, Ann Arbor, Mich. Filed May 11, 1889. Serial No. 310,494. (No model.)

Claim.—1. The combination, in a car-coupling, with the draw-head, of a transverse bearing-bar located therein, a coupling-hook pivotally mounted upon said bar and projecting from the draw-head, and a hook-lifting lever pivotally mounted upon the said coupling-hook bearing-bar at one side the coupling-hook of the draw-head and projecting downwardly and forwardly, and mechanism bearing upon the ends or portions of said hook and lever projecting in rear of their common bearing-bar for elevating the forward ends of the coupling-hook and lifting-lever, substantially as and for the purpose set forth.



2. The combination, in a car-coupling, of the draw-head having a chamber, as at B, at its front end, provided with an inclined wall at the lower portion of the mouth of said chamber, a transverse bearing-bar located within the draw-head, the coupling-hook pivotally mounted upon said bar and having its forwardly-projecting and normally resting upon said wall, said hook projecting in rear of its fulcrum, a hook-lifting lever mounted upon said coupling-hook bearing-bar at one side the coupling-hook and projecting downwardly and forwardly and in rear of its fulcrum, and an independent vertically-moving shoe or plate located within the draw-head and bearing upon the ends of the coupling-hook and hook-lifting lever which project in rear of their common fulcrum, substantially as and for the purpose set forth.

3. The combination, in a car-coupling, with the draw-head comprising the chamber at its front, as at B, having an inclined front wall at the lower end of the mouth of said chamber, having longitudinally-disposed slots in its sides and the longitudinally-disposed top slot, of a transverse bar mounted in said side slots and adjustable therein, a coupling-hook fulcrumed upon said adjustable bar and normally resting upon the inclined wall, a hook-lifting lever fulcrumed upon the bar at one side the coupling-hook and projecting downwardly and forwardly in rear of the inclined wall, a vertically-moving shoe or plate located within the draw-head and bearing upon the rear ends of the coupling-hook and hook-lifting lever, and an operating-rod secured to said plate and projecting through the top slot, substantially as and for the purpose set forth.

4. An improved car-coupling comprising the draw-head provided with a chamber, as at B, at its front end, having an inclined wall at the lower portion of the mouth of said chamber, provided with longitudinally-disposed slots in its sides having recesses or depressions at their termini, a transverse bar mounted in said slots and received by the recesses at the termini of the same, a coupling-hook fulcrumed upon the bar and normally resting upon the inclined wall, a hook-lifting lever fulcrumed upon the bar at one side the coupling-hook and projecting downwardly and forwardly in rear of the inclined wall, a vertically-moving shoe or plate bearing upon the rear ends of the coupling-hook and hook-lifting lever, and mechanism for operating this plate, substantially as and for the purpose set forth.

5. An improved car-coupling comprising the draw-head having the chamber at its front end, the rearwardly-inclined front wall at the lower portion of the mouth of said chamber, terminating in a cylindrical top edge, as at *c*, the vertical perforations adapted to receive an ordinary coupling-pin, the longitudinally-disposed slots in its sides having recesses or depressions at their termini, and a longitudinally-disposed top slot, a transverse bar mounted in the side slots and received by the recesses at the termini of the same, a coupling-hook fulcrumed upon the bar and normally resting upon the inclined wall, a hook-lifting lever fulcrumed upon the bar at one side the coupling-hook and projecting downwardly and forwardly in rear of the inclined wall, a vertically-moving shoe or plate bearing upon the rear ends of the coupling-hook and hook-lifting lever, an operating-rod secured to said plate and projecting through the top slot, and mechanism for operating said rod, substantially as and for the purpose set forth.

411,466. CAR-COUPLING. JEROME B. MOTTER, Harrington, W. Va., and ERASTUS B. TODD, Pittsburg, Pa., assignors of one-eighth to Charles L. Schanz, Pittsburg, Pa. Filed Aug. 22, 1888. Serial No. 283,422. (No model.)

Claim.—1. The combination, in a car-coupling, with the draw-head, of a transverse bearing-bar located therein, a coupling-hook pivotally mounted upon said bar and projecting from the draw-head, and a hook-lifting lever pivotally mounted upon the said coupling-hook bearing-bar at one side the coupling-hook of the draw-head and projecting downwardly and forwardly, and mechanism bearing upon the ends or portions of said hook and lever projecting in rear of their common bearing-bar for elevating the forward ends of the coupling-hook and lifting-lever, substantially as and for the purpose set forth.

2. The combination, in a car-coupling, of the draw-head having a chamber, as at B, at its front end, provided with an inclined wall at the lower portion of the mouth of said chamber, a transverse bearing-bar located within the draw-head, the coupling-hook pivotally mounted upon said bar and having its forwardly-projecting and normally resting upon said wall, said hook projecting in rear of its fulcrum, a hook-lifting lever mounted upon said coupling-hook bearing-bar at one side the coupling-hook and projecting downwardly and forwardly and in rear of its fulcrum, and an independent vertically-moving shoe or plate located within the draw-head and bearing upon the ends of the coupling-hook and hook-lifting lever which project in rear of their common fulcrum, substantially as and for the purpose set forth.

3. The combination, in a car-coupling, with the draw-head comprising the chamber at its front, as at B, having an inclined front wall at the lower end of the mouth of said chamber, having longitudinally-disposed slots in its sides and the longitudinally-disposed top slot, of a transverse bar mounted in said side slots and adjustable therein, a coupling-hook fulcrumed upon said adjustable bar and normally resting upon the inclined wall, a hook-lifting lever fulcrumed upon the bar at one side the coupling-hook and projecting downwardly and forwardly in rear of the inclined wall, a vertically-moving shoe or plate located within the draw-head and bearing upon the rear ends of the coupling-hook and hook-lifting lever, and an operating-rod secured to said plate and projecting through the top slot, substantially as and for the purpose set forth.

4. An improved car-coupling comprising the draw-head provided with a chamber, as at B, at its front end, having an inclined wall at the lower portion of the mouth of said chamber, provided with longitudinally-disposed slots in its sides having recesses or depressions at their termini, a transverse bar mounted in said slots and received by the recesses at the termini of the same, a coupling-hook fulcrumed upon the bar and normally resting upon the inclined wall, a hook-lifting lever fulcrumed upon the bar at one side the coupling-hook and projecting downwardly and forwardly in rear of the inclined wall, a vertically-moving shoe or plate bearing upon the rear ends of the coupling-hook and hook-lifting lever, and mechanism for operating this plate, substantially as and for the purpose set forth.

5. An improved car-coupling comprising the draw-head having the chamber at its front end, the rearwardly-inclined front wall at the lower portion of the mouth of said chamber, terminating in a cylindrical top edge, as at *c*, the vertical perforations adapted to receive an ordinary coupling-pin, the longitudinally-disposed slots in its sides having recesses or depressions at their termini, and a longitudinally-disposed top slot, a transverse bar mounted in the side slots and received by the recesses at the termini of the same, a coupling-hook fulcrumed upon the bar and normally resting upon the inclined wall, a hook-lifting lever fulcrumed upon the bar at one side the coupling-hook and projecting downwardly and forwardly in rear of the inclined wall, a vertically-moving shoe or plate bearing upon the rear ends of the coupling-hook and hook-lifting lever, an operating-rod secured to said plate and projecting through the top slot, and mechanism for operating said rod, substantially as and for the purpose set forth.

tained by said recesses, said bar being longitudinally adjustable, for the purpose set forth, a coupling-hook fulcrumed upon said bar and normally resting upon the inclined wall, a hook-lifting lever fulcrumed upon the bar at one side the coupling-hook and projecting downwardly and forwardly in rear of the inclined wall, a vertically-moving shoe or plate located within the draw-head above the rear ends of the coupling-hook and hook-lifting lever and adapted to bear upon the same, and an operating-rod secured to said plate and projecting upwardly through the top slot, substantially as and for the purpose set forth.

6. In a car-coupling, the combination, with the draw-head, of a longitudinally-adjustable hook-lifting lever fulcrumed within the same and projecting downwardly and forwardly, and independent mechanism disconnected therefrom and adapted for elevating the front portion of said lever, whereby it will lift and disengage the head of the coupling-hook of an adjoining draw-head, substantially as set forth.

7. In a car-coupling, the combination, with the draw-head provided with a chamber at its front portion and having an inclined front wall at the lower portion of the mouth of said chamber, said wall being adapted to be engaged by the coupling-hook of an adjoining draw head and form the draft-bar of the coupling, of a hook-lifting lever fulcrumed at the rear of said chamber and projecting downwardly and forwardly in rear of and approximately under the inclined wall, and independent mechanism for elevating the front portion of the hook to cause the same to disengage the head of the coupling-hook of an adjoining draw-head from the top edge of the wall, substantially as shown and specified.

8. The combination, in a car-coupling, with the draw-head provided at its front end with a chamber and having a rearwardly-inclined front wall extending transversely across the lower portion of the mouth of said chamber, of a hook-lifting lever fulcrumed within the draw-head and projecting downwardly and forwardly in rear of and approximately under said wall, the operating portion or foot of the lever being broadened, substantially as set forth, with relation to the width of the wall, whereby it will operate to disengage the head of the coupling-hook of the adjoining draw-head in whatever relation said hook may be with relation to the transverse length of said wall, substantially as set forth.

9. In a car-coupling, the herein-described hook-lifting lever, comprising the cylindrical bearing portion, the rearwardly-projecting power end, and the downwardly and forwardly projecting operating portion formed with a broadened approximately flat foot, substantially as shown, and for the purpose set forth.

10. In a car-coupling of the class described, the combination, with the draw-head having an inclined front wall adapted to be engaged by the coupling-hook of an adjoining draw-head, of a hook-lifting lever fulcrumed in rear of said wall and having a front operating portion projecting downwardly and forwardly with relation thereto and formed with an approximately-flat broadened foot and with an arm projecting rearwardly and upwardly from its fulcrum, and a vertically-moving independent shoe or plate located above and adapted to bear upon said arm, substantially as and for the purpose set forth.

11. An improved draw-head comprising integrally an inclined front wall forming the front of the chamber and integral with the side walls thereof, and the herein-described steel bar projecting transversely through the draw-head and secured to the said sides and top edge of the front wall, said steel bar being thus a component part of the sides and wall of the integral draw-head and projecting above in rear of and below the limit of the wall proper and forming a steel wearing edge for the same, substantially as set forth.

12. In a car-coupling of cast-iron or other metal, a steel bar or bolt secured in position with relation to the draw-head during the process of casting the same, and thus forming an integral component part thereof, said bolt being adapted to form the bearing-edge over which automatic coupling devices engage, substantially as and for the purpose set forth.

13. In a car-coupling, a pivoted coupling-hook located at one side, and a hook-lifting lever located at the side of the coupling-hook within the same draw-head and adapted to disengage the coupling-hook of an adjoining draw-head, substantially as set forth.

14. In a car-coupling, the combination of a coupling-hook and a hook-lifting lever mounted side by side upon the same transverse bar, and independent mechanism located over or above and acting directly upon the rear projecting portion of both, acting upon the coupling-hook and hook-lifting lever for simultaneously elevating the front ends of the same, substantially as and for the purpose set forth.

15. In a car-coupling comprising the draw-head having a chamber at its forward end provided with a transverse inclined front wall at the lower portion of its mouth, the combination of a coupling-hook fulcrumed within the draw-head and having its front portion normally resting upon said inclined wall, a hook-lifting lever fulcrumed at one side the coupling-hook and upon the same bearing bar or shaft and having a downwardly and forwardly projecting front portion, and a rear arm projecting above and at the side of the corresponding rear end of the coupling-hook, and a vertically-moving shoe or plate located above the rear ends of the hook-lifting lever and coupling-hook and adapted to first bear upon the former to elevate its front end with relation to the inclined wall, and then in its further movement simultaneously act directly upon and depress the rear ends of both the coupling-hook and hook-lifting lever, substantially as and for the purpose set forth.

16. In a car-coupling of the class described, the combination, with the transverse fulcrum-bar, of a coupling-hook pivotally mounted upon the same at one side the draw-head, and a hook-lifting lever fulcrumed upon the same fulcrum-bar and at one side the coupling-hook, and having the enlarged or elongated bearing portion occupying the entire space between the coupling-hook and the opposite side of the draw-head, whereby the coupling-hook is retained in position at one side, substantially as set forth.

17. In a car-coupling of the class described, having the draw-head provided with a chamber at its front end and with a transverse inclined front wall at the lower portion of the mouth of said chamber, said wall being adapted to be engaged by the coupling-hook of an adjoining draw-head, the combination of the transverse fulcrum-bar, a coupling-hook pivotally mounted upon the same at one side the draw-head and normally resting upon the inclined wall, and a hook-lifting lever fulcrumed upon the same fulcrum-bar and having a laterally-enlarged bearing portion extending from the side of the coupling-hook to the opposite side of the draw-head, whereby the coupling-hook is retained in position at one side of the chamber, said lever being provided with a front operating portion or foot projecting downwardly and forwardly, and broadened so as to operate with relation to all that portion of the edge of the inclined wall not occupied by the coupling-hook, and also occupy the space within the chamber between the coupling-hook and the opposite side of the draw-head, substantially as and for the purpose set forth.

18. The combination, with the draw-head having the longitudinally-disposed slots in its sides provided with recesses or depressions at their termini, of the transverse fulcrum-bar carrying the coupling mechanism, which normally projects from the mouth of the draw-head, and comprises, essentially, a coupling-hook and hook-lifting lever having projecting rear arms or ends, both fulcrumed upon said bar and longitudinally adjustable therewith, and vertically-moving independently-operating mechanism adapted to bear upon said ends, but stationary with relation to the longitudinal adjustment of the hook and lever, the ends of the bar being received by the recesses at either end of the slots and retained in position thereby against accidental displacement, substantially as and for the purpose set forth.

19. In a car-coupling, the combination, with the draw-head having a chamber, as at B, at its front end, an inclined front wall at the lower portion of the mouth of said chamber, the vertical perforations adapted to receive an ordinary coupling-pin, and the longitudinally-disposed slots in its sides having the recesses or depressions at their termini, of the transverse fulcrum-bar carrying automatic coupling mechanism longitudinally adjustable with the fulcrum-bar, and comprising a coupling-hook having a rear arm or end and normally projecting from the mouth of the draw-head and resting upon the inclined wall, and vertically-moving independently-operating mechanism adapted to bear upon the rear arm of the coupling-hook and stationary with relation to the longitudinal adjustment thereof, the fulcrum-bar being normally seated in the recesses at the front ends of the slots and retained therein against dislodgment by rearward pressure, the bar being adapted to be lifted from said recesses by depression of the outer end of the coupling-hook and forced rearwardly to the rear recesses, substantially as and for the purpose set forth.

20. A car-coupling in which the draw-head is provided with a chamber at its front portion, in which the automatic coupling mechanism, comprising a coupling-hook and hook-lifting lever at the side of the same, is normally contained, this coupling mechanism being all mounted upon a longitudinally-adjustable transverse fulcrum bar adapted by its rearward adjustment to carry all the automatic coupling mechanism out of the chamber, so that only the front end of the coupling-hook remains at one side the same, whereby the employment of an ordinary pin-and-link coupling is permitted, the coupling-hook being entirely contained within the chamber by this adjustment, substantially as set forth.

21. A car-coupling in which the draw-head is provided with a chamber at its front portion, in which automatic coupling mechanism, comprising a coupling-hook and hook-lifting lever mounted side by side, is normally contained, in combination with an independent vertically-moving plate or shoe adapted to bear directly upon the rear ends of both the hook and lever, and stationary with relation to the longitudinal adjustment of said hook and lever, and a transverse fulcrum-bar carrying the hook and lever, and longitudinally adjustable in the draw-head, said fulcrum-bar being adapted by its rearward adjustment to carry all the automatic coupling mechanism out of the

the side of the car, and a vertically-moving latch-bolt adapted to en-

chamber, under the operating-shoe, to the rear portion of the draw-head, and thus permit the employment of an ordinary pin-and-link coupling, substantially as set forth.

22. In a car-coupling, the combination, with the vertically-moving shoe or plate having the screw-threaded eye or recess, of the detachable operating-rod projecting through the top of the draw-head, and having the corresponding screw-threaded end, substantially as set forth.

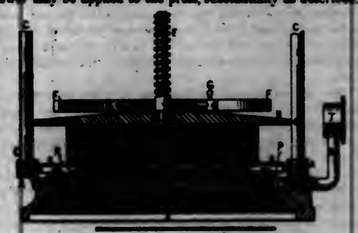
23. In a car-coupling of the class described, embodying fulcrumed coupling hooks or lovers, the combination of a vertically-moving plate or shoe adapted to bear upon the ends of the same, an operating-rod connected with said plate and projecting through the draw-head, a rod or handle located at the platform of the car or other suitable point, and a connecting-lever pivotally secured at its ends to said rods, substantially as and for the purpose set forth.

24. In a car-coupling, the combination of uncoupling mechanism, the car-platform provided with a recess or depression, and a vertically-adjustable operating-bar connected with the coupling mechanism and having its head normally contained within said recess, substantially as and for the purpose set forth.

25. The combination, with the draw-head carrying the automatic coupling mechanism carried by a longitudinally-adjustable fulcrum-bar and having the longitudinally-disposed slots in its under side, and with the plate or shoe adapted by its vertical movement to operate the coupling mechanism, of a rod or bar projecting upwardly through said slot at the rear end of the draw-head, extended forwardly above the plane of the fulcrum-bar and secured to the shoe or plate, and lever mechanism connected with the outer end of said rod and adapted to vertically operate the same, substantially as set forth.

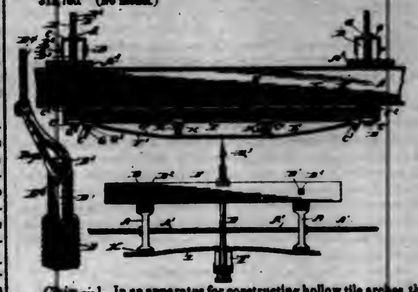
26. The combination of a draw-head having longitudinally-disposed slots in its sides, a transverse fulcrum-bar mounted in said slots and longitudinally adjustable therein, a coupling-hook fulcrumed upon said bar at one side the draw-head and having an arm or end projecting in rear of its fulcrum, a hook-lifting lever fulcrumed upon the same bar beside the coupling-hook and having an arm or end projecting in rear of its fulcrum, and independent mechanism located above the rear ends of the hook and lever and acting directly and simultaneously upon the same, substantially as and for the purpose set forth.

27. The combination of a draw-head having longitudinally-disposed slots in its sides, a transverse fulcrum-bar mounted in said slots and longitudinally adjustable therein, a coupling-hook fulcrumed upon said bar at one side the draw-head and having an arm or end projecting in rear of its fulcrum, a hook-lifting lever mounted upon the same bar beside the coupling-hook and having an arm or end projecting in rear of its fulcrum, a vertically-moving independent shoe or plate located above the rear ends of the hook and lever and adapted to operate directly and simultaneously upon both said ends, and an operating-rod carrying said plate and stationary with relation to the longitudinal adjustment of the fulcrum-bar and automatic coupling mechanism, substantially as and for the purpose set forth.



28. The combination of a draw-head having a chamber at its front end provided with an inclined transverse wall adapted to be engaged by the coupling-hook of an adjoining draw-head and provided with a vertical perforation extending through said chamber and adapted to receive an ordinary coupling-pin, and with longitudinally-disposed slots in its sides in rear of said chamber, a transverse fulcrum-bar mounted in said slots and longitudinally adjustable therein, a coupling-hook fulcrumed upon said bar and having an arm or end projecting in rear of its fulcrum, a hook-lifting lever fulcrumed upon the same bar beside the coupling-hook and having a front end acting with relation to the inclined wall and an arm or end projecting in rear of its fulcrum, both the hook and lever being longitudinally adjustable in the draw-head by movement of their joint fulcrum-bar, an independent vertically-moving shoe or plate located above the rear ends of the hook and lever and adapted to directly and simultaneously act upon both said ends when the automatic coupling mechanism is in normal position, and an operating-bar carrying said plate and stationary with relation to the longitudinal adjustment of the automatic coupling mechanism, substantially as and for the purpose set forth.

411,467. COPYING-PRESS. JOHN P. MCPHERSON, Boston, Mass. Filed June 11, 1888. Serial No. 313,866. (No model.)



Claim.—1. A copying-press consisting of a base having a chamber provided with liquid connected with a pressure-gage, a flexible diaphragm, a yielding plate resting thereon, a movable plate operated by means of a screw having a fixed gear-wheel, and a pinion geared therewith provided with means by which it may be rotated with a ratchet-wrench or lever applied thereto, substantially as described, as and for the purposes set forth.

2. In a copying-press, the combination of a liquid-chamber, a pressure-gage connected therewith, a flexible diaphragm, a yielding plate resting thereon, a movable pressure-plate, and means for actuating the same, substantially as and for the purposes set forth.

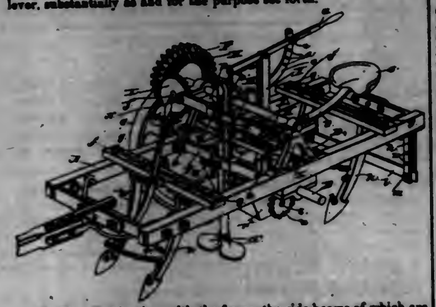
3. A copying-press consisting of a base, a movable plate operated by means of a central screw having a fixed gear-wheel, and a small pinion geared therewith, provided with means by which it may be rotated with a ratchet-wrench or lever, by means of which an increase of power may be applied to the press, substantially as described.

411,468. APPARATUS FOR LAYING TILE ARCHES FOR FLOORING. JOSEPH PAPAN, Chicago, Ill. Filed May 31, 1889. Serial No. 312,760. (No model.)

Claim.—1. In an apparatus for constructing hollow tile arches, the combination of stringers extending from one to the other of the beams between which the arch is to be laid, a rod passing through such stringers, having a nut on the upper end thereof and a hole through such rod, and having the upper end of the rod cut away on the sides thereof, whereby a cord may be secured to said rod, and the nut on the threads cut on said rod may be unscrewed therefrom and slid upon said rope, and a bearer supported at each end by one of said rods and having boards laid thereon upon which the arch may be laid, all substantially as described.

2. In an apparatus for constructing hollow tile arches, the combination of stringers B B, rod D, having the upper end thereof cut away on the sides, hole D^3, nut *d*, beam F, suspension-rod F', and adjustable supports extending from suspension-rod F' to beam F, all substantially as described.

411,469. BUTTON FOR BILLIARD-COUNTERS. OTTO PAPE, Washington, D. C. Filed Jan. 16, 1889. Serial No. 296,731. (No model.)



Claim.—1. A game-counter button perforated near its middle and parted through the perforation, and also perforated edgewise, in combination with a wire fitted to the said edgewise perforation, and adapted to be bent at the edges of the button, substantially as shown and described.

2. The combination of a game-counter button perforated near its middle and parted from the said perforation to the circumference, and also perforated edgewise across the said parting, and a wire adapted to fit the said edgewise perforation, substantially as shown and described.

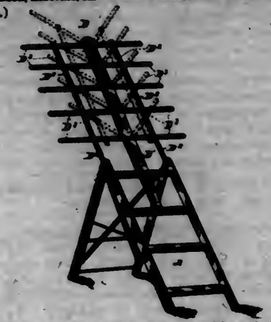
3. As a new article of manufacture and trade, a game-counter button having a central perforation adapting it to be strung upon a wire and parted through the said perforation, and a wire adapted to cross the said parting and to secure the two parts rigidly together, yet leaving the button when so secured together around a wire free to slide thereon, substantially as shown and described.

411,470. COTTON CHOPPING, PLANTING, AND CULTIVATING MACHINE. DAVID W. PILAND, Weather, Tex. Filed Apr. 16, 1888. Serial No. 307,409. (No model.)

Claim.—1. The combination of the rectangular frame, the vertical guides or flanges upon the inner sides of the side beams thereof, a transverse beam sliding vertically in said guides and carrying an oscillating chopping-lever, an upright mounted upon the frame, an adjusting-lever pivoted to said upright, and a link connecting said adjusting-lever with the vertically-sliding beam carrying the chopping-lever, substantially as and for the purpose set forth.

2. The combination, with the frame, the side beams of which are provided on their inner sides with vertical guides or flanges, of the transverse cross-bar sliding between said flanges, the chopping-lever mounted pivotally in said cross-bar, a pitman connected pivotally at one end to a sliding cross-head and having its other end connected with a wrist-pin upon the face of a wheel, to which rotary motion is imparted from the axle of the machine, a pin connecting said pitman with a vertical slot in the upper end of the chopping-lever, and an adjusting-lever, one end of which is connected by a link with an arm extending upwardly from the vertically-adjustable cross-bar carrying the chopping-lever, and the other end of which is provided with a spring-catch adapted to engage any one of a series of perforations in a segmental bracket, substantially as and for the purpose set forth.

411,471. LABEL-HOLDER FOR FREIGHT-CARS. DAVID R. PRICE, Chicago, Ill., assignor of one-half to Frank P. Smith, same place. Filed Feb. 26, 1889. Serial No. 301,478. (No model.)



Claim.—1. In a label-holder for cars, a frame made up of bar A, the ends thereof being secured to each other, cross-bars extending from the corners of said rectangular frame, and bars extending from the side pieces to near the centers of the upper and lower cross-pieces of the frame, hinges for securing the frame to the car-body, one of said hinges being secured snugly between the ends of the diagonal bars, and a latch having a gravity-bolt which passes over the upper cross-piece between the upper ends of the diagonal bars, substantially as shown, and for the purpose set forth.

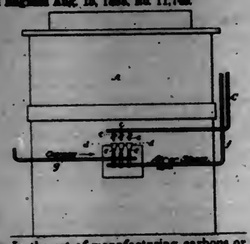
2. The combination, in a label-holder for cars, of a frame made up of a rim or bar A, the ends of which are jointed together, diagonal cross-bars secured to said rim, the upper cross-piece of said rim being curved outwardly, castings D, for pivotally connecting the frame to the side of the car, and a vertically-moving latch-bolt adapted to engage the center of the upper cross-piece of the frame, so as to hold the same against the car-body, substantially as shown, and for the purpose set forth.

3. The combination, in a label-holder for cars, of a bar A, bent to form a rectangular frame, the upper and lower cross-pieces thereof being curved or bent outwardly, diagonal cross-bars extending from corner to corner of the frame, short cross-bars attached to the center of the vertical side pieces of the frame, said cross-bars lying above the longer diagonal bars, their upper and lower ends being secured to the horizontal pieces of the frame A on each side of the centers, hinges D D, for attaching the frame to the car-body, the center hinge lying between the eyes *e e*, and a gravity-latch secured to the car-body above the frame, said latch being adapted to engage with the upper cross-piece between the eyes *e'*, substantially as shown, and for the purpose set forth.

411,472. COMBINED STEP-LADDER AND CLOTHES-RACK. GEO. E. RICHARDSON, Bartville, Ill. Filed Dec. 14, 1888. Serial No. 293,023. (No model.)

Claim.—The combination, with the step-ladder, of the clothes-rack formed of a central bar and side bars fitted to said ladder, and of cross-bars pivoted at their inner ends to the central bar and intermediately of their ends to the side bars, substantially as set forth.

411,473. RUNNING-GEAR FOR ROAD-WAGONS. CYRUS W. SALADEE, Cleveland, Ohio. Filed Apr. 6, 1889. Serial No. 306,195. (No model.)

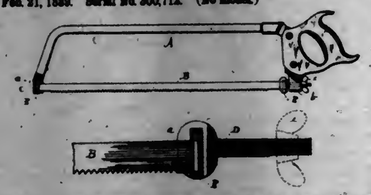


Claim.—1. In a road-wagon, longitudinally-arranged side springs adapted to carry the body, the terminal eyes of said springs being pivotally connected to the hind axle and front bolster upon immovable bearings, in combination with a spring-reach extended to connect the axles, the rear end of said reach being bent downward, then upward, with its terminal eye pivotally connected to the center portion of the hind axle without a link, and axle-stays having their front ends pivotally connected to the spring-reach at or near its center portion, and their rear ends shackled to the axle at widely-separated points, the whole being constructed, combined, and arranged to operate substantially as shown and described.

2. The bracket F, rigidly secured to the spring-reach B at or near its central portion, having its terminal eye engage the front ends of the axle-stays C C by the passing bolt 1, in combination with the intermediate distance sleeve or spool H, and passing bolt 2, substantially as and for the purpose set forth.

3. The combination of the cross-brace E', bracket F, axle-stays C C, the rear ends of the latter being shackled to the axle, preferably at or near the shoulders thereof, and the front ends passed over the top side of the cross-brace and pivotally connected to the bracket F, substantially as specified.

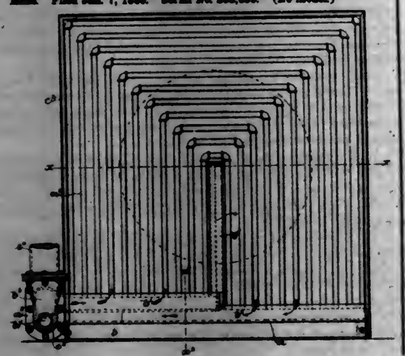
4. In combination with the longitudinally-arranged side springs A A, the central spring-reach B, suspended in a plane below the side springs and extended to connect the axles, having its rear end pivotally connected to the middle portion of the hind axle and its front end to the shackle-plate N', carried by the bolster D^2, the inner end of said plate terminating in the upturned ears N, between which the terminal eye of the spring B is held by the passing bolt T, substantially as set forth.



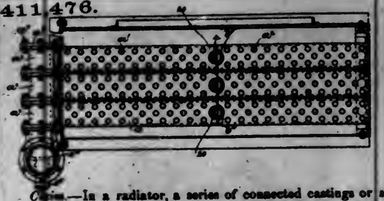
411,474. MANUFACTURE OF CARBONS FOR INCANDESCENT ELECTRIC LAMPS. JOHN S. SELLON, Hatton Gardens, County of Middlesex, England. Filed Jan. 28, 1889. Serial No. 297,230. (No model.) Patented in England Aug. 15, 1888, No. 11,749.

Claim.—1. In the art of manufacturing carbons or filaments for incandescent electric lamps, the improvement consisting in subjecting such filaments, by consumption of fluid fuel such as specified, to a high degree of heat, as set forth, over and beyond that obtainable by the use of coke or coal surrounding the crucible, substantially as described.

2. In the art of manufacturing carbons or filaments for incandescent electric lamps, the improvement consisting in heating the same to a high temperature, as indicated, by burning fluid fuel such as specified in a suitable furnace, and at the conclusion of the operation raising the temperature to a still higher degree for a short period by the introduction of a blast of oxygen, substantially as described.



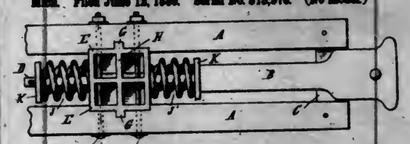
411,475. SAW. GUSTAF F. SELLSTROM, Jamestown, N. Y. Filed Feb. 21, 1889. Serial No. 300,712. (No model.)



Claim.—1. In meat or similar saws, the blade having raised projections across the width at each end, and a frame having a hole at one end of sufficient depth to receive said projections on the blade, in combination with an adjustable yoke having suitable means for securing same in frame and provided with similar hole to receive the projection on the other end of saw, said holes in frame and yoke being provided with suitable washers or caps to form a back support to saw-blades of different widths, substantially as shown, and for the purpose set forth.

2. In meat or similar saws, the blade having raised projections across the width at each end, and a frame having a hole at one end of sufficient depth to receive said projections on the blade, in combination with an adjustable yoke having suitable means for securing the same in frame, and provided with similar hole to receive the projection on the other end of saw-blade, said frame and yoke being provided with suitable means to form a back support for saws of different widths, substantially as shown, and for the purpose set forth.

411,476. RADIATOR. BENJAMIN F. STURTEVANT, Jamaica Plain, Mass. Filed Jan. 7, 1889. Serial No. 296,099. (No model.)

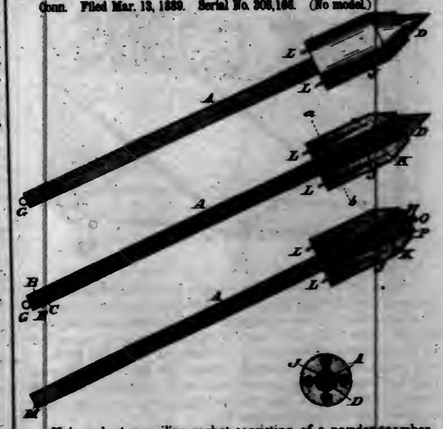


411,476.

Claim.—In a radiator, a series of connected castings or shells, each provided with a dividing-wall to form inlet and outlet chambers, combined with a series of pipes connecting the said inlet and outlet chambers, whereby the steam admitted into each inlet-chamber at one end of each casting is delivered from each outlet-chamber at the same end of each casting, substantially as described.

411,477. DRAW-BAR ATTACHMENT. JOHN TURNER, Detroit, Mich. Filed June 12, 1889. Serial No. 313,976. (No model.)

Claim.—1. The herein-described draw-bar bearing, consisting of a rectangular casting having a central tube therein to receive the reduced end of the draw-bar, and vertical and horizontal webs formed integral with the tube and the interior of the casting, substantially as described.



2. The herein-described draw-bar bearing, consisting of a rectangular casting having a central tube in which the reduced end of the draw-bar bears, vertical and horizontal webs formed integral with the tube and interior of the casting, and vertical ribs in the exterior of the casting, all substantially as and for the purpose described.

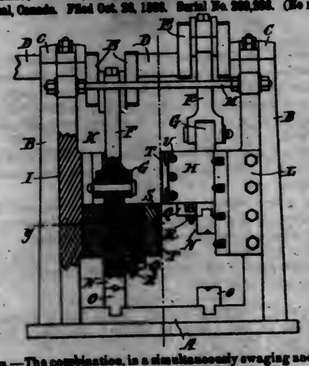
3. In combination with the draw-bar timbers and draw-bar, a rectangular casting having exterior ribs fitting in the timbers, a central tube forming a bearing for the reduced end of the draw-bar, and vertical and horizontal webs formed integral with the tube and the exterior of the casting for sustaining the said tube, substantially as described.

411,478. SOLVENT FOR GAS-PIPE DEPOSITS. MARTIN R. WALDSTEIN, New York, N. Y. Filed Nov. 23, 1888. Serial No. 291,071. (No specimens.)

Claim.—A mixture composed of fusel-oil of commerce and benzine or specified equivalent, substantially as described.

411,479. SEA-OILING ROCKET. ALBERT H. WALKER, Hartford, Conn. Filed Mar. 13, 1889. Serial No. 303,166. (No model.)

Claim.—1. A sea-oiling rocket consisting of a powder-chamber at its head, and of a filled oil-chamber extending rearward from that powder-chamber and constituting the rocket-stick, and having specific gravity less than that of water, while one of its ends has specific



gravity greater than that of water, and the other end is provided with a passage for the upward egress of the oil when the oil-chamber is immersed in the sea, all substantially as described.

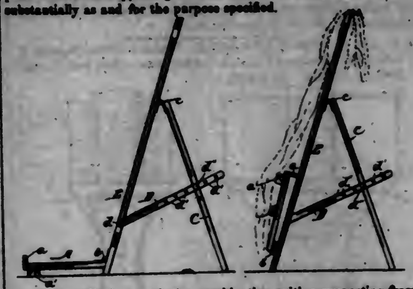
2. A sea-oiling rocket consisting of an annular powder-chamber at its head, and of a filled oil-chamber placed axially therein and extending rearward therefrom and constituting the rocket-stick, and having specific gravity less than that of water, while one of its ends has specific gravity greater than that of water, and the other end is provided with a passage for the upward egress of the oil when the oil-chamber is immersed in the sea, all substantially as described.

3. A sea-oiling rocket consisting of an annular powder-chamber at its head, and of a filled oil-chamber separable therefrom and loosely placed axially therein and extending rearward therefrom and constituting the rocket-stick, and having specific gravity less than that of water, while one of its ends has specific gravity greater than that of water, and the other end is provided with a passage for the upward egress of the oil when the oil-chamber is immersed in the sea, all substantially as described.

4. A sea-oiling projectile consisting of the combination of the shell A, the base-block B, provided with an opening therethrough, the valve C, closing that opening, the weight D, adapted to keep that opening upward in the water, and the ping E, holding the valve C on its seat in the base-block B and adapted to release that hold by being pulled out from the base-block, all substantially as described.

411,480. APPARATUS FOR SWAGING AND ROLLING. HENRY H. WARREN, Hanover, N. Y., assignor of one-half to Andrew Laundry, Montreal, Canada. Filed Oct. 20, 1888. Serial No. 288,293. (No model.)

Claim.—The combination, in a simultaneously swaging and rolling apparatus, of the cranks E and connecting-rods F, and slide-blocks H, arranged to reciprocate and move in opposite directions by said cranks and connecting-rods, each slide-block H having a rolling-die T and the half of a pair of swaging-dies N, with bed A, having the other half O of the swaging-dies, the whole constructed, arranged, and operating substantially as described.



411,481. ROPE-TRACE COCKEYE. WILLIAM H. WILLIAMS and STEWART GROVER, Byron, Wis. Filed Apr. 15, 1889. Serial No. 307,206. (No model.)

Claim.—As an improved article of manufacture, a rope-trace cockeye comprising two sections formed with internal grooves extending from end to end thereof, for the purpose set forth, one of said sections being formed with an enlarged perforated end and with an eye extending from said end, and the other of said sections having an inwardly-extending flange having a projection for engagement with the said perforation, whereby said sections are hinged or pivoted together at this point, and means for securing the sections together when the rope has been inserted, all substantially as shown, and for the purpose set forth.

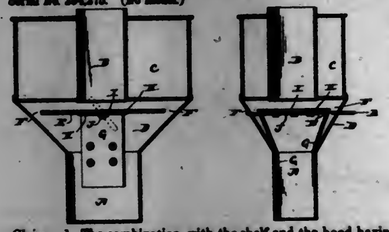
411,482. DISPLAY-STAND. WILLIAM R. WESTON, Chicago, Ill. Filed Nov. 19, 1888. Serial No. 291,202. (No model.)

Claim.—1. In a display-stand, the combination, with a supporting-frame provided with a suitable folding standard, of a folding shelf hinged directly to said frame near its bottom and provided at its free edge with a vertical flange, and also provided with depending rests of the same length as the portion of the supporting-frame which is below the shelf, whereby the latter is held in a horizontal position, or parallel with the supporting-surface on which the display-stand rests, substantially as and for the purpose specified.

2. In a display-stand, the combination, with a supporting-frame having a folding shelf hinged thereto and provided with a central vertical bar parallel with its side bars, of the standard or leg hinged to the rear side of the supporting-frame, and the locking-piece D, pivoted to the side of the central bar of the supporting-frame, whereby when folded it bears against the side thereof and is in alignment therewith, substantially as specified.

3. The herein-described show stand or rack for the display of fabrics, &c., comprising the supporting-frame B, having parallel side bars and a center bar, the folding shelf hinged to the side bars of the supporting-frame near their lower ends and provided with rests *d' d'*, equal in height to the portions of the side bars which are below the shelf, and also provided with a stop or guard *a* at its outer edge, the adjustable standard C, hinged to the center bar of the supporting-frame near its upper end and provided with a pin d^3, and the locking-piece D, pivoted at one end to the side of the center bar of the supporting-frame and provided with perforations *d' d'*, to be engaged by the pin d^3, all constructed and arranged substantially as and for the purpose specified.

411,488. TEA OR COFFEE POT. LUTHER S. WEBBER, Groton, N. Y. Filed June 15, 1889. Serial No. 314,082. (No model.)



Claim.—The combination, with the pot A and handle D, provided with the slot *a*, of the lid B, provided with the slot *b*, and the lever E, rigidly secured to the under side of the lid and passing through the aforesaid slots *a* and *b*, and curved to correspond to the under side of the handle and lie in proximity thereto when the lid is closed, all constructed and arranged substantially in the manner and for the purpose described.

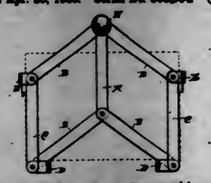
411,484. REIN-GUARD. WILLIAM P. YOUNG, Bear Wallow, Ky. Filed June 13, 1889. Serial No. 314,062. (No model.)

Claim.—As an improved article of manufacture, the herein-described device for securing in place the bridle or checkrein of harnesses, the same consisting of the metallic plate A, formed of a single piece of metal and provided on its upper side at substantially its longitudinal center with an opening for the passage of an overcheck-rein and upon either side of said opening with hooks C, for use in securing in place the reins used in connection with hame-harnesses, and having at its lower edge means for securing the same to the harness, substantially as and for the purpose specified.

411,485. STOVE-PIPE SHELF. WILLIS J. YOUNG, SHAFFER H. YOUNG, and ZACHARIAH U. KNOOR, Hebron, Nebr. Filed Dec. 21, 1888. Serial No. 294,275. (No model.)

Claim.—1. The combination, with the shelf and the hood having aligned openings, of the horizontal partition within the hood, having its ends arranged a slight distance from the ends of the hood, and provided with a central opening in alignment with the openings in the hood and shelf, the supporting-tongues formed integral with and depending from the sides of the partition, and the damper adapted to close the central opening in the partition and having its operating-rod journaled in the sides of the hood, as specified.

2. The combination, with the stove-shelf and the hood depending therefrom, of the horizontal partition within the hood, having a central opening and arranged out of contact with the hood, the supporting-tongues depending from the sides of the partition, and a damper adapted to close the central opening in the partition, as set forth.

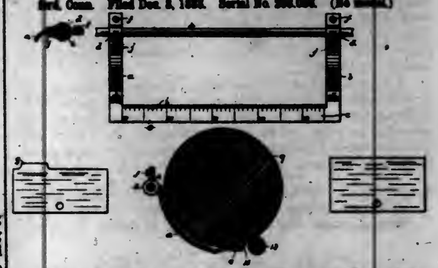


411,486. SASH-CORD FASTENER. EDWIN W. ALDE, New Britain, Conn. Filed June 22, 1888. Serial No. 316,171. (No model.)

Claim.—1. The herein-described sash-cord iron, consisting of the shell A in the form of a cylinder or partial cylinder and provided with the bridge 6, bent inward from the periphery of said shell, so as to form an opening that extends longitudinally through the sash-cord iron, substantially as described, and for the purpose specified.

2. The herein-described sash-cord iron, consisting of a shell of a cylindrical or partly cylindrical form, provided with the depressed bridge 6, and having also the open recess 7 on the upper side at its outer end, substantially as described, and for the purpose specified.

411,487. PLATE-WASHING FRAME. BRAYTON B. BARKER, Newark, N. J. Filed Apr. 25, 1888. Serial No. 272,504. (No model.)



Claim.—1. The combination, in a plate-washing device, of collapsible end frames comprising, essentially, four bars pivoted at their inner ends to a central bar and at their outer ends to the side frames, substantially as set forth.

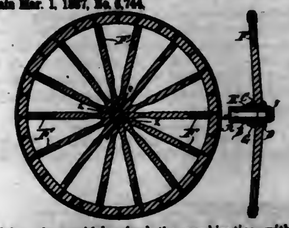
2. The combination, in a plate-washing device, of collapsible end frames comprising, essentially, four bars pivoted at their inner ends to a central bar and at their outer ends to the side frames, and set-screws whereby the apparatus may be held in its position as adjusted, substantially as set forth.

3. The combination, in a plate-washing device, of collapsible end frames comprising, essentially, four bars pivoted at their inner ends to a central bar and at their outer ends to the side frames, and supports for the plates against vertical and lateral movement, located on the side frames, substantially as set forth.

4. The combination, in a plate-washing device, of collapsible end frames comprising, essentially, four bars pivoted at their inner ends to a central bar and at their outer ends to the side frames, and supports for the plates against vertical and lateral movement, located on the side frames, and set-screws whereby the end frames may be held in their adjusted position, substantially as set forth.

411,488. TYPE-WRITING MACHINE. JAMES W. BAKER, Newark, N. J., assignor to the American Writing Machine Company, Hartford, Conn. Filed Dec. 3, 1888. Serial No. 292,696. (No model.)

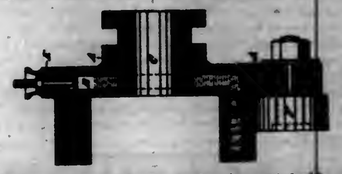
Claim.—1. In a type-writing machine, the combination, with the usual carriage-plate 15, of a bar, as *c*, provided at each end with spring-arms *a* and *b*, substantially as and for the purpose set forth.



2. In a type-writing machine, the combination, with the usual carriage-plate 15, of an adjustable overlapping spring-pressed bar, as *c*, as set forth.

3. In a type-writing machine, the combination, with the usual carriage-plate 15, of a detachable overlapping spring-pressed bar, as *c*, as set forth.

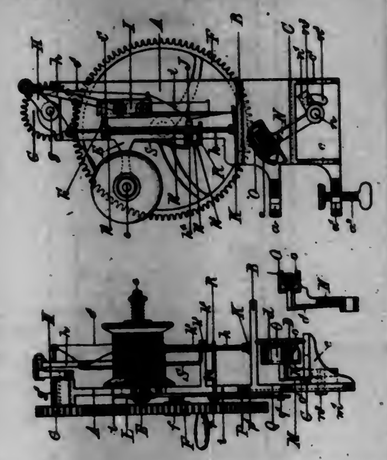
4. In a type-writing machine, the combination, with the usual carriage-plate 15, of the overlapping bar, as *c*, having arms *a b*, connected by clamps to the paper-carriage rail, as set forth.



5. In a type-writing machine, the combination, with the usual carriage-scale plate, of the overlapping bar, as *c*, provided with a supplementary scale, as set forth.

411,489. VEHICLE-WHEEL. EMILIO BAYLE, Barcelona, Spain. Filed Apr. 19, 1888. Serial No. 271,189. (No model.) Patented in Spain Mar. 1, 1887, No. 6,744.

Claim.—In a vehicle-wheel, the combination, with the tenoneless spokes and the felly having the sockets therein, of the substantially straight keys, arranged on only one of the sides of the spokes and bolted thereto, having the extended ends entering the sockets in the felly, substantially as described.



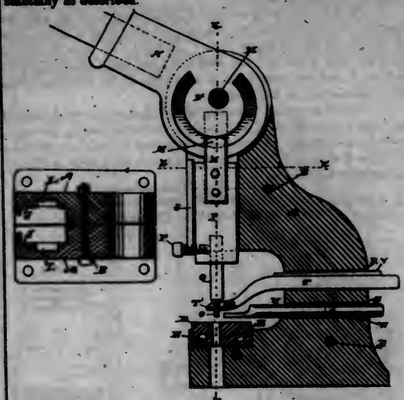
411,490. MEANS FOR LUBRICATING PICKING-TAPPETS OF WEAVING-LOOMS. BENJAMIN BERRY and DANIEL B. BERRY, Bradford, England. Filed May 23, 1888. Serial No. 311,607. (No model.)

Claim.—1. A tappet for weaving-looms, provided with a lubricating-chamber having a duct leading to the anti-friction roller carried by said tappet adapted to supply said roller with lubricant, substantially as herein shown and described.

2. The combination, with a tappet provided with a lubricating-chamber and an educt, of an air-valve arranged for the passage of air, substantially as herein shown and described, and for the purpose specified.

411,491. PRESSING MECHANISM FOR SEWING-MACHINES. FREDERICK H. CORDEN, Wolverhampton, England. Filed Oct. 11, 1888. Serial No. 287,888. (No model.) Patented in England Aug. 11, 1888, No. 10,997.

Claim.—1. The combination of a cross-head or needle-bar, a link rigidly attached to the said needle-bar, a bar carrying the cloth-feeding presser-foot, a stud projecting from the said needle-bar and adapted to engage with a corresponding projection on the top of the stem of the said cloth-feeding presser-foot at each upstroke of the said needle-bar, a spiral spring upon the said stem adapted to return it after each engagement by the said stud, a plate adapted to be moved in a direction at right angles with that of the said link, and a stud upon the said link adapted to engage in a twice-bent slot in the said plate with a lever adapted to move in a plane at right angles with the direction of the said needle-bar and having its fulcrum upon the lower guide of the presser-foot stem, said lever being connected with said plate and with said presser-foot bar, as set forth.

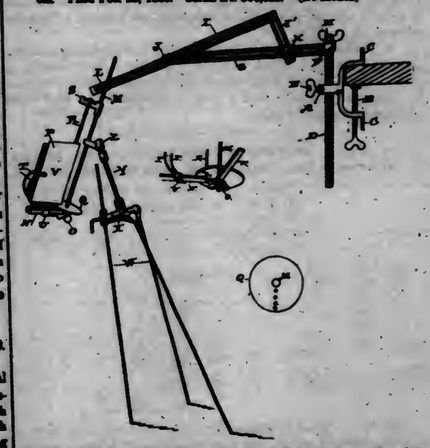


2. The combination of a stud projecting from the cross-head or needle-bar, and adapted to engage with a corresponding projection on the top of the stem of the cloth-feeding presser-foot at each upstroke of the said needle-bar, a spiral spring upon the said stem adapted to return it after each engagement by the said stud, a groove in an enlargement upon the presser-foot stem, and a spring-detent fixed to the standard of the machine and adapted to engage in the said groove each time the said stem is raised, as set forth.

411,492. PUNCH. JAMES DRAPER, Stockton, Cal. Filed Feb. 1, 1889. Serial No. 298,261. (No model.)

Claim.—1. The two-part standard or frame having the vertical guiding channels or depressions J and the deeper channels or depressions L formed in the front upper portion and the chamber in which the head of the operating-eccentric is fulcrumed, in combination with the vertically-sliding cross-head fitted in the channels J and carrying the punch in its lower end, and the side bars K, fitted in the channels L and connected with the eccentric, substantially as described.

2. The circular head having the eccentric channels G made upon opposite sides and the fulcrum bolt-hole H, made eccentric to the channels and the periphery of the head, in combination with the cross-head I, fitted in channels in the main frame, the arms K, engaging other channels in said frame, and the inwardly-projecting oval studs M at the upper ends of said arms, which fit into the channels in the head, whereby the cross-head is caused to reciprocate by the movement of the head, substantially as described.



3. The two-part frame A, with the punch-carrying cross-head and operating-eccentric, as described, in combination with the stripper or pull-off, the front end of which clasps the punch, and the shank of which is fitted to pass through the slot or channel in the frame, and the wedge or keys whereby the stripper is adjusted up or down, substantially as described.

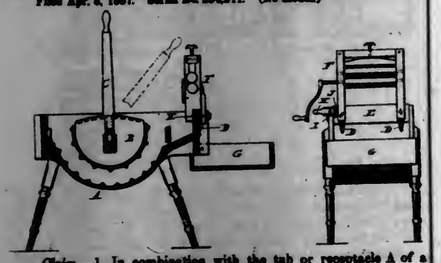
4. The two-part frame, the vertically-moving punch-carrying cross-head, the eccentric head whereby it is actuated, and the vertical adjustable stripper or pull-off fitted in channels in the meeting faces of the two-part frame, in combination with the gage-shank U, sliding horizontally in the corresponding horizontal central hole made in the adjoining faces of the two-part frame and the locking-nut W, substantially as described.

5. The gage U, having the flattened portion U', the cylindrical shank extending through a corresponding hole in the frame, and a locking-nut whereby the front of the gage may be set horizontally or vertically and its distance from the punch regulated, substantially as herein described.

411,493. BOOK-REST AND EASEL. JOHN DUNKIN, Santa Rosa, Cal. Filed Feb. 23, 1889. Serial No. 300,932. (No model.)

Claim.—1. A book-holder consisting of the slotted arm G and the L-shaped slotted arm I, with the uniting-pins and locking-nuts, in combination with the book-support upon the outer end of said arms and adjustable thereon, substantially as described.

2. The slotted arm G and the L-shaped slotted arm I, adjustable with relation to the arm G, and the adjustable support M, attached to the outer end of the arm I, in combination with a vertically-adjustable rod D, and a socket through which said rod moves, and by which it may be attached to the wall or other support, substantially as described.



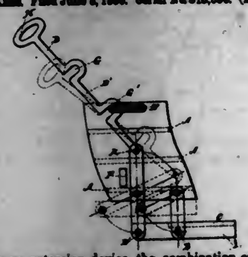
3. The adjustable slotted arms G I, the book-support consisting of the rod M, adjustable with relation to the outer arm, the jointed rods N on the lower end of the rod M, with the locking or holding nut, the rod E, by which the center of the book is held, and the cir-

tie arms T, adjustably fitted on the rod N, for holding the sides of the book, substantially as described.

4. The book-holder consisting of the adjustable rod M, with the support Q at the lower end, the hinged adjustable arms N on the lower end of said rod M, the elastic arms T, carried by the arms N, and by which the sides of the book are held, said arms being adjustable upon the arms N, and the central rod R, adjustable to the thickness of the book, substantially as described.

5. The book-support consisting of the slotted adjustable arms G and I, the adjustable standard D, rod M, and book-holding device, in combination with the adjustable legs adapted to rest upon the floor and the socket-frame X, connected to the rod M, so as to act as a brace, substantially as described.

411,494. WASHING-MACHINE. EDGAR A. BEMISH, Albion, N.Y. Filed Apr. 6, 1887. Serial No. 234,211. (No model.)



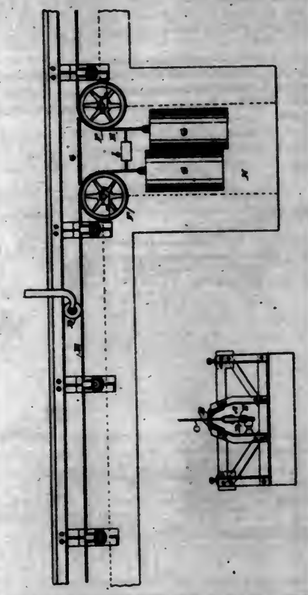
Claim.—1. In combination with the tub or receptacle A of a washing-machine, a cross-bar E, hinged thereto, a wringer F, secured to said cross-bar, and a locking device holding the wringer in operative position, substantially as shown.

2. In combination with the tub or receptacle A of a washing-machine, a cross-bar E, hinged thereto, a wringer F, secured to said cross-bar, and a receptacle G, also secured to the tub or receptacle and adapted to receive and support the wringer when thrown out of operative position.

3. In combination with tub or receptacle A of a washing-machine, cross-bar E, hinged thereto, wringer F, secured to said cross-bar, and a lever H, pivoted to the tub or receptacle and adapted to lock the cross-bar in position.

4. In combination with tub or receptacle A of a washing-machine, cross-bar E, hinged thereto, wringer F, secured to said cross-bar, a plate J, applied to the outer face of the cross-bar, a plate I, secured to the tub or receptacle, and a lever H, pivoted to the plate I and adapted to engage the plate J.

411,495. EXTENSION-STEP FOR RAILWAY-CARS. THOMAS A. FITZ, Parsons, Kans. Filed June 8, 1889. Serial No. 313,696. (No model.)

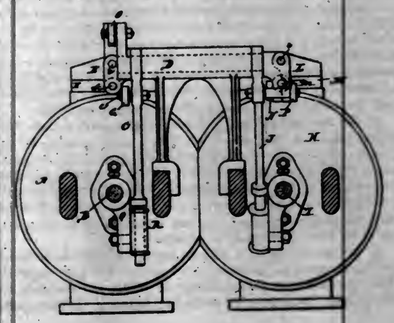


Claim.—1. In an extension device, the combination of lever D, loops or notches G and G', and supporting-lever E', movable supporting-arms B B B, carrying or extension arms I I, and staple E, or other guide and fastening, substantially as and for the purpose specified.

2. In an extension-step for railway-cars and other vehicles, the combination of lever D, loops or notches G and G', supporting-lever E', movable supporting-arms B B B, and extension-arms I I, with step C, for the purpose and substantially as specified.

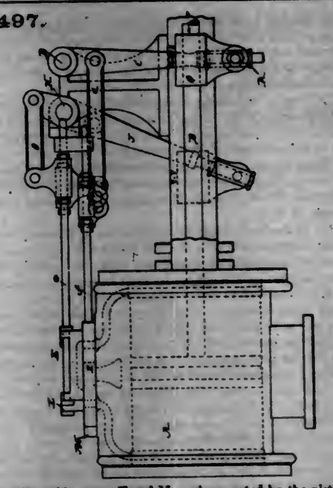
411,496. ELECTRIC RAILWAY. GEORGE B. FRALEY, San Francisco, Cal. Filed June 21, 1888. Serial No. 315,697. (No model.)

Claim.—1. In an electrical railway, the slotted underground conduit, a conductor extending longitudinally within said conduit, insulated supports extending over the sides of the conduit, pulleys journaled at intervals between the supports over which the ends of adjacent conducting-wires are passed, and weights suspended beneath said pulleys from the ends of these wires, substantially as herein described.



2. In an underground electrical conduit, the conductor made in sections supported upon insulated bearing-arms at intervals throughout the conduit, the end of each section passing over the periphery of the pulley journaled beneath it, and weights attached to the depending ends of the said sections, so as to produce an automatically-adjustable tension at all times upon the conducting-wires, substantially as described.

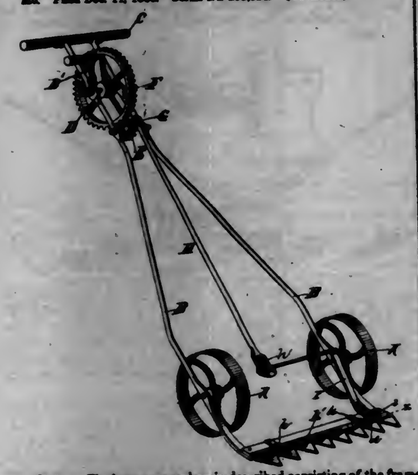
3. The underground electrical conduit, the conductor extending through said conduit, and the insulating-supports consisting of the cylindrically-grooved insulators I, the clamps N, fitting said grooves and secured thereto, and the elastic grooved block S, within which the conducting-wire is supported, substantially as described.



4. The underground electrical conduit, the conducting-wire extending longitudinally therein, the grooved or channeled insulators secured to the side of the conduit, having the elastic arms U projecting therefrom, and the grooved supports W, journaled diagonally, so as to support the conductor around curves, substantially as described.

411,497. DUPLEX ENGINE. HARVEY F. GASKILL, Lockport, N.Y.; Mary R. Gaskill executrix of said Harvey F. Gaskill, deceased. Filed July 13, 1888. Serial No. 279,941. (No model.)

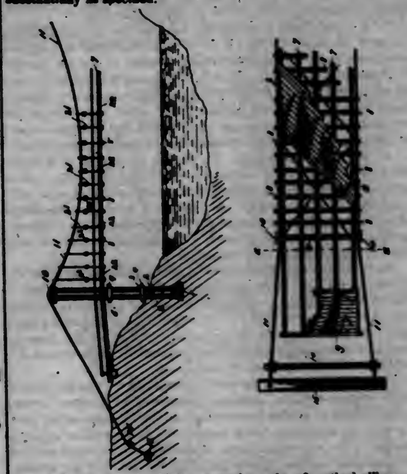
Claim.—The combination, substantially as set forth, in a duplex engine, of the two cylinders A and H, the valves E and L, each operated by the piston-rod of the cylinder to which it does not pertain,



411,497.

and the sliding valve-seats F and M, each operated by the piston-rod of the cylinder to which it does pertain.

411,498. LAWN-MOWER. ALEXANDER GRAHAM, Hottinsville, Ma. Filed Dec. 11, 1888. Serial No. 292,321. (No model.)

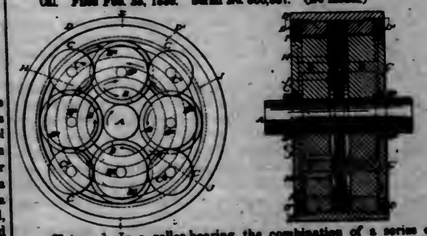


Claim.—The lawn-mower herein described consisting of the frame B, having wheels mounted thereon and the bars of its upper ends arranged parallel to each other, a gear-wheel F between the parallel portions of the frame-bars, a crank for rotating the same, a pinion mounted on a crank-shaft between the bars, with which the gear meshes, a pitman secured to the crank of the crank-shaft having a socket at its lower end, a ball crank pivoted to the frame having a ball on one end placed in the socket, and a box on its opposite end, the cutter-bar having a pin on its upper face, and a block, as *d*, formed with oppositely-projecting arms, and a central opening for connecting the ball-crank and cutter-bar, substantially as described.

411,499. SUSPENSION-BRIDGE. WILLIAM H. C. GREEN, Sherman, Tex. Filed Apr. 23, 1888. Serial No. 308,331. (No model.)

Claim.—1. In a suspension-bridge, opposite pillars arranged in pairs and provided with adjustable tie-plates, in combination with transverse girders mounted on the tie-plates, longitudinal beams mounted on the girders, cables suspended over cap-pieces mounted at the upper end of the pillars, adjustable suspension-bars depending from these cables and connected to transverse tie-bars arranged under the longitudinal beams, substantially as specified.

2. In a suspension-bridge, a cable composed of parallel strands suitably bound together and provided with opposite sleeves, from which the strands diverge, in combination with an anchor comprising two perforated plates for the reception of the cables against the under surface of which they are bent, and a binding-plate provided with binding-bolts for binding the same against the bent ends of the cable, substantially as specified.



3. In a suspension-bridge, opposite pairs of vertical pillars, each pair connected at its upper end by a longitudinally-grooved cap and provided with adjustable tie-plates, in combination with transverse girders mounted on the tie-plates, longitudinal beams mounted on the girders, depending sectional adjusting-rods provided with tie-bars extending underneath the longitudinal beams and connected with the cables, the latter arranged in the grooves of the caps, and an anchor for securing the terminals of the cables, substantially as specified.

4. The mill C, having the oppositely-arranged pairs of pillars 2, braced, as at 5, and provided with the adjustable tie-plates 3, having binding-screws 4, grooved caps 10, and arched brace 24, in combination with the girders 6, arranged on the tie-plates, the beams 7, arranged on the girders, and the floor 9, arranged on the beams, and of the suspension-cables 11, arranged in the grooved caps, the anchors 15, and the chains 14, arranged at the terminals of the cable, substantially as specified.

5. The combination of the cable 11 and its support with the depending rods 21, the tie-bars 8 and their rods 22, and the connecting turn-buckles 23, substantially as specified.

411,500. ROLLER-BEARING. REUBEN W. HUNT, San Francisco, Cal. Filed Feb. 28, 1889. Serial No. 300,967. (No model.)

Claim.—1. In a roller-bearing, the combination of a series of bearing-rollers having journals of smaller diameter than said rollers, and a series of separating-rollers adapted to bear only on said journals with a ring bearing at its periphery on journals of the separating-rollers, and at its inner side on journals of the bearing-rollers, all substantially as and for the purposes set forth.

2. In a roller-bearing, a series of rollers B, having journals B^2, and the journals B^2, of smaller diameter than the rollers B, and a series of rollers C, bearing only on the journals B^2 and having journals C^2, in combination with a ring H, bearing at its periphery on the journals C^2 and at its inner side on the journals B^2, all substantially as shown and described, and for the purposes set forth.

3. In a roller-bearing, the combination, with the central journal and the bearing-casing, of a series of bearing-rollers bearing thereon, having journals of smaller diameter than said rollers and bearing only on a series of separating-rollers keeping the bearing-rollers separate from each other, the said series of separating-rollers bearing only on said journals, and a ring bearing at its periphery on journals of the separating-rollers, and at its inner side on journals of the bearing-rollers, all substantially as and for the purposes set forth.

4. A roller-bearing comprising the shaft A, the casing D, the sleeves D', the series of rollers B, of the same length and between the same planes as the sleeves D' and having journals B^2, and the journals B^3, of smaller diameter than the rollers B, the series of rollers C, bearing only on the journals B^2 and having journals C^2, and a ring H, bearing at its periphery on the journals C^2 and at its inner side on the journals B^2, all constructed, arranged, combined, and adapted to operate substantially as shown and described, and for the purposes set forth.

5. In a roller-bearing, the combination of a series of bearing-rollers having journals of smaller diameter than said rollers, and a series of separating-rollers adapted to bear only on said journals, with a ring bearing at its periphery on journals of the separating-rollers and at its inner side on journals of the bearing-rollers, and a ring bearing at its inner side on said journals of the separating-rollers, all substantially as and for the purposes set forth.

6. In a roller-bearing, a series of rollers B, having journals B^2, and the journals B^3, of smaller diameter than the rollers B, and a series of rollers C, bearing only on the journals B^2 and having journals C^2, in combination with a ring H, bearing at its periphery on the journals C^2 and at its inner side on the journals B^2, and a ring I, bearing at its inner side on the journals C^2, all substantially as shown and described, and for the purposes set forth.

7. In a roller-bearing, the combination, with the central journal and the bearing-casing, of a series of bearing-rollers bearing thereon, having journals of smaller diameter than said rollers and bearing only on a series of separating-rollers, keeping the bearing-rollers separate from each other, the said series of separating-rollers bearing only on said journals, a ring bearing at its periphery on journals of the separating-rollers and at its inner side on journals of the bearing-rollers, and a ring bearing at its inner side on said journals of the separating-rollers, all substantially as and for the purposes set forth.

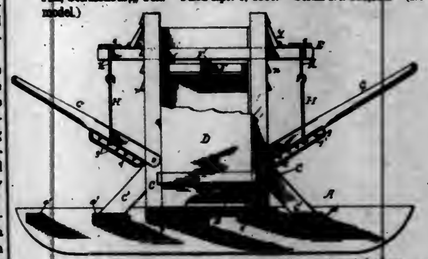
8. A roller-bearing comprising the shaft A, the casing D, the sleeves D', the series of rollers B, of the same length and between the same planes as the sleeves D' and having journals B^2, and the journals B^3, of smaller diameter than the rollers B, the series of rollers C, bearing only on the journals B^2 and having journals C^2, a ring H, bearing at its periphery on the journals C^2 and at its inner side on the journals B^2, and a ring I, bearing at its inner side on the journals C^2, all constructed, arranged, combined, and adapted to operate substantially as shown and described, and for the purposes set forth.

9. In a roller-bearing, the combination of a series of bearing-rollers having journals of smaller diameter than said rollers, and a series of separating-rollers adapted to bear only on said journals, with a ring bearing at its periphery on journals of the separating-rollers and at its inner side on journals of the bearing-rollers, and a ring bearing at its periphery on the latter journals, all substantially as and for the purposes set forth.

10. In a roller-bearing, a series of rollers B, having journals B^2, and the journals B^3, of smaller diameter than the rollers B, and a series of rollers C, bearing only on the journals B^2 and having journals C^2, in combination with a ring H, bearing at its periphery on the journals C^2 and at its inner side on the journals B^2, and a ring J, bearing at its periphery on the journals B^2, all substantially as shown and described, and for the purposes set forth.

11. In a roller-bearing, the combination, with the central journal and the bearing-casing, of a series of bearing-rollers bearing thereon, having journals of smaller diameter than said rollers and bearing only on a series of separating-rollers, keeping the bearing-rollers separate from each other, the said series of separating-rollers bearing only on said journals, a ring bearing at its periphery on journals of the separating-rollers and at its inner side on journals of the bearing-rollers, and a ring bearing at its periphery on the latter journals, all substantially as and for the purposes set forth.

12. A roller-bearing comprising the shaft A, the sleeves D', the series of rollers B, of the same length and between the same planes as the sleeves D' and having journals B^2, and the journals B^3, of smaller diameter than the rollers B, the series of rollers C, bearing only on the journals B^2 and having journals C^2, a ring H, bearing at its periphery on the journals C^2, and at its inner side on the journals B^2, and a ring J, bearing at its periphery on the journals B^2, all constructed, arranged, combined, and adapted to operate substantially as shown and described, and for the purposes set forth.



13. In a roller-bearing, the combination of a series of bearing-rollers having journals of smaller diameter than said rollers, and a series of separating-rollers adapted to bear only on said journals, with a ring bearing at its periphery on journals of the separating-rollers and at its inner side on journals of the bearing-rollers, a ring bearing at its inner side on said journals of the separating-rollers, and a ring bearing at its periphery on the last-named journals of the bearing-rollers, all substantially as and for the purposes set forth.

14. In a roller-bearing, a series of rollers B, having journals B^2, and the journals B^3, of smaller diameter than the rollers B, and a series of rollers C, bearing only on the journals B^2 and having journals C^2, in combination with a ring H, bearing at its periphery on the journals C^2 and at its inner side on the journals B^2, a ring I, bearing at its inner side on the journals C^2, and a ring J, bearing at its periphery on the journals B^2, all substantially as shown and described, and for the purposes set forth.

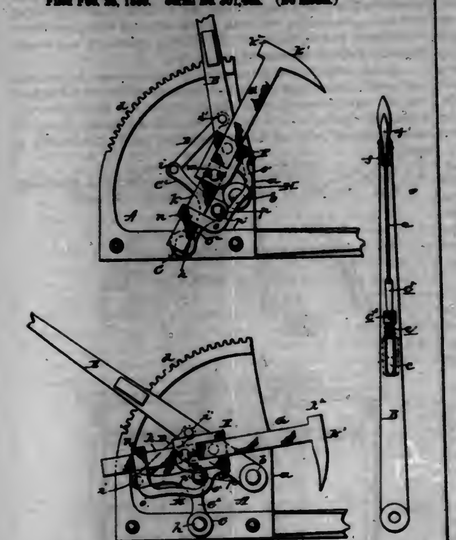
15. In a roller-bearing, the combination, with the central journal and the bearing-casing, of a series of rollers bearing thereon having journals of smaller diameter than said rollers and bearing only on a series of separating-rollers, keeping the bearing-rollers separate from each other, the said series of separating-rollers bearing only on said journals, a ring bearing at its periphery on journals of the separating-rollers and at its inner side on journals of the bearing-rollers, a ring bearing at its inner side on said journals of the separating-rollers, and a ring bearing at its periphery on the last-named journals of the bearing-rollers, all substantially as and for the purposes set forth.

16. A roller-bearing comprising the shaft A, the sleeves D', the series of rollers B, of the same length and between the same planes as the sleeves D' and having journals B^2, and the journals B^3, of smaller diameter than the rollers B, the series of rollers C, bearing only on the journals B^2 and having journals C^2, a ring H, bearing at its periphery on the journals C^2 and at its inner side on the journals B^2, a ring I, bearing at its inner side on the journals C^2, and a ring J, bearing at its periphery on the journals B^2, all constructed, arranged, combined, and adapted to operate substantially as shown and described, and for the purposes set forth.

411,501. BALING-PRESS. William Hillman and Joseph F. Ritter, Schulenburg, Tex. Filed Apr. 8, 1889. Serial No. 306,343. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of the base-plate, the casing made in two trough-shaped sections D and D', one of which is hinged to the base-plate, the bifurcated uprights, the operating-levers on each side hinged to the uprights, the compressing-beam extending across the baling-chamber and through the uprights, and connections between the compressing-beam and the levers.

2. The combination, substantially as hereinbefore set forth, of the base-plate, the casing made in two trough-shaped sections D and D', one of which is hinged to the base-plate, the bifurcated uprights C, the operating-levers on each side hinged to the uprights, the sled, the braces C', secured to the sled and to the uprights, the compressing-beam extending across the baling-chamber and through the uprights, the hooks on the outer ends of the compressing-beam and the chains connecting the operating-levers with the hooks, whereby the connections between the levers and the compressing-beam may be adjusted.



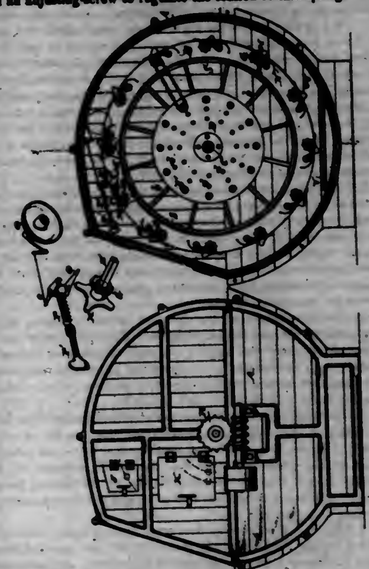
3. The combination, substantially as hereinbefore set forth, of the base-plate, the casing made in two trough-shaped sections D and D', one of which is hinged to the base-plate, the bifurcated uprights C, the operating-levers G on each side hinged to the uprights, the compressing-beam extending through the uprights, the loops h', attached to the outer ends of the compressing-beam, the straps e surrounding the loops, the links H', having hooked ends engaging with the loops h', the teeth g on the operating-levers with which the lower ends of the links H' engage, and the straps g', inclosing the teeth.

411,502. PIPE-WRENCH. John D. Hoose, Kearney, N. J. Filed May 10, 1889. Serial No. 310,266. (No model.)

Claim.—In pipe-tongs, the combination, with the hook-handle A and lever-handle B, of the parallel arms b' b^2 at an obtuse angle to handle B, the screw D, passing down through said arms obliquely, the nut C, arranged on the screw between said arms, and the sliding jaw F, connected by a pivoted link E with the screw D and retained on the shank by shaft F', substantially as shown and described.

411,503. SAW-MILL DOG. Benwell J. Kelley, Laurel, Miss. Filed Feb. 26, 1889. Serial No. 301,662. (No model.)

Claim.—1. The combination, with a head-block, of a segmental toothed standard, a lever adapted to vibrate and interlock with the teeth of the curved face of the standard, a dog pivoted to the lever at a point behind the pivotal connection of the dog and lever, and devices to connect the dog limb and lever, substantially as set forth.



2. The combination, with a standard, the edge of which is a curved segmental rack, a lever pivoted to have its movable locking-toe engage the teeth of this segmental rack, and a device to trip the locking-toe of the lever, of an elongated box pivoted by one end to the lever, a log-holding dog, the limb of which is made to slide in this box and be secured at any desired point, and a pivoted connecting-arm and link, which are adapted to rock the log-dog when the lever is vibrated, substantially as set forth.

3. The combination, with a segmental toothed standard having a vertical face and a pivotal lever adapted to interlock with the teeth of the standard, of an elongated box pivotally attached to the lever, a log-holding dog adjustably secured in the box, a bent arm pivoted to the standard, a link connecting the arm and lever, and an anti-friction roller mounted on the bent arm and engaging an extension of the elongated box, substantially as set forth.

411,504. DYEING OR SCOURING MACHINE. Charles L. Klauss, Philadelphia, Pa. Filed Sept. 17, 1888. Serial No. 285,867. (No model.)

Claim.—1. In a dyeing or scouring machine, the combination of a dye or liquor tank, a frame partly supported therein, inner and outer sets of crum-bars carried by the frame upon which the skeins of yarn to be treated are hung, one of said sets of bars being adapted to rotate to gradually turn the yarn, projections moved with said rotatable crum-bars, a pivoted stop in the path of said projections, and a spring to normally hold said stop in position, whereby as the frame carries the crum-bars past the stop the projections thereof strike the stop and impart to the bar a portion of a revolution, but when the bar is not free to rotate the pivoted stop is pushed aside by said projection and returns again to its normal position after the projection has passed it, and an indicator operated by said pivoted stop when moved.

2. In a dyeing or scouring machine, the combination of a dye or liquor tank, a frame partly supported therein, inner and outer sets of crum-bars carried by the frame upon which the skeins of yarn to be treated are hung, one of said sets of bars being adapted to rotate to gradually turn the yarn, projections moved with said rotatable crum-bars, a pivoted stop in the path of said projections, a spring to normally hold said stop in position, whereby as the frame carries the crum-bars past the stop the projections thereof strike the stop and impart to the bar a portion of a revolution, but when the bar is not free to rotate the pivoted stop is pushed aside by said projection and returns again to its normal position after the projection has passed it, and an adjusting-screw to regulate the tension of said spring.

3. In a dyeing or scouring machine, the combination of a dye or liquor tank, a frame partly supported therein, inner and outer sets of crum-bars carried by the frame upon which the skeins of yarn to be treated are hung, one of said sets of bars being adapted to rotate to gradually turn the yarn, projections moved with said rotatable crum-bars, a pivoted stop in the path of said projections, a spring to normally hold said stop in position, whereby as the frame carries the crum-bars past the stop the projections thereof strike the stop and impart to the bar a portion of a revolution, but when the bar is not free to rotate the pivoted stop is pushed aside by said projection and returns again to its normal position after the projection has passed it, and an indicator operated by said pivoted stop when moved.

4. In a dyeing or scouring machine, the combination of a dye or liquor tank, a frame partly supported therein, inner and outer sets of crum-bars carried by the frame upon which the skeins of yarn to be treated are hung, one of said sets of bars being adapted to rotate to gradually turn the yarn, projections moved with said rotatable crum-bars, a pivoted stop in the path of said projections, a spring to normally hold said stop in position, whereby as the frame carries the crum-bars past the stop the projections thereof strike the stop and impart to the bar a portion of a revolution, but when the bar is not free to rotate the pivoted stop is pushed aside by said projection and returns again to its normal position after the projection has passed it, an alarm or indicator consisting of a gong and hammer, and a connection between said pivoted stop and hammer.

5. In a dyeing or scouring machine, the combination of a dye or liquor tank, a frame partly supported therein, inner and outer sets of crum-bars carried by the frame upon which the skeins of yarn to be treated are hung, one of said sets of bars being adapted to rotate to gradually turn the yarn, star-wheels loosely journaled in said frame acting as bearings for said rotatable crum-bars, a stop in the path of the projections of said star-wheels, whereby, as the frame carries the crum-bars past the stop the projections of the star-wheels strike the crum-bars and impart to the bar a portion of a revolution, ratchets connected with said star-wheels and rotating with them, and pawls upon the frame to engage in said ratchet to prevent backward rotation of the crum-bars.

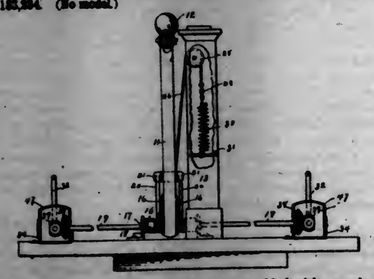
6. The combination of a dye or liquor tank, a frame partly sup-

ported therein, inner and outer sets of cross-bars carried by the frame upon which the skeins of yarn to be treated are hung, and circular guides on the inner faces of said supporting-frame to keep the skeins away from said faces of the frame.

7. The combination of a dye or liquor tank, a frame partly supported therein, inner and outer sets of cross-bars carried by the frame upon which the skeins of yarn to be treated are hung, one of said sets of bars being adapted to rotate to gradually turn the yarn, suitable means to rotate the frame and move the cross-bars through the liquor, and an indicator operated by said rotatable cross-bars to indicate when through any accident one of said bars has not been rotated.

8. In a dyeing or scouring machine, the combination of a rotatable frame, inner and outer sets of cross-bars carried by said frame and removable therefrom and having their ends projecting through one end of said frame, upon which bars the yarn to be dyed or scoured is hung, a closed case for said rotating frame, the lower portion of which is adapted to contain the dye or other liquor, said case being provided with guiding-surfaces adjacent to the ends of said bars, and doors located in the said guide-surfaces and in the paths of the ends of said cross-bars, through which doors said bars may be inserted in or removed from said frame or adjusted in it.

9. In a dyeing or scouring machine, the combination of a rotating frame, supporting-bars for the yarn adapted to rotate and carried by said frame, a dye-vat for the liquor through which said supporting-bars are carried, and a spring-stop arranged in the path of said rotatable supporting-bars adapted to strike against them and impart to them a portion of a revolution, but, if any of said bars is not free to rotate, to be pushed aside and return again to its normal position after the bar has passed it.



10. The combination of the dye tank or vat, a rotating frame having journals therein, longitudinally-movable cross-bars for carrying the yarn, whereby they may be removed or inserted in the rotating frame, and a circular guide to prevent the longitudinal movement of the cross-bars to lock them in operative position on the rotating frame.

11. The combination of the dye tank or vat, a rotating frame having journals therein, longitudinally-movable cross-bars for carrying the yarn, whereby they may be removed or inserted in the rotating frame, a circular guide to prevent the longitudinal movement of the cross-bars to lock them in operative position on the rotating frame, and removable doors or sections formed in said guides to permit the removal of the cross-bars.

12. The combination of the dye-vat, a rotating frame, cross-bars journaled therein for holding the skeins of yarn and carrying them through the liquor in the vat, mechanism for rotating said cross-bars, and a gong or indicator to indicate when either of said cross-bars becomes fast against rotation, and a connection between the gong or indicator and cross-bars adapted to be operated by the cross-bars.

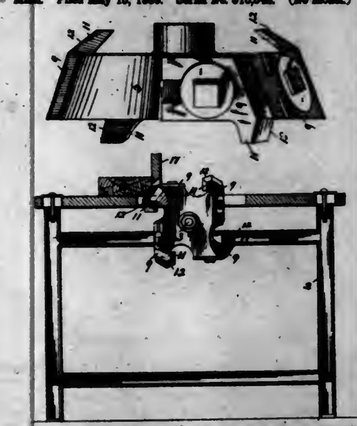
13. The combination of the dye-vat, a rotating frame, cross-bars journaled therein for holding the skeins of yarn and carrying them through the liquor in the vat, mechanism for rotating said cross-bar, ratchet-wheels connected to and rotating with said cross-bars, and pawls to prevent backward movement to said ratchet-wheels.

411,505. **VERTICALLY-SWINGING GATE.** LEWIS GARDNER KNOWLES, New York, N. Y.; Hugh A. Knowles administrator of said Lewis Gardner Knowles, deceased. Filed Nov. 18, 1885. Serial No. 183,294. (No model.)

Claim.—1. A vertically-swinging gate provided with an axle 15, in combination with shaft 19, arms 20, secured to said shaft, stops with which said arms co-operate, and wheel-irons geared to shaft 19, substantially as set forth.

2. In combination with the pivoted gate, wheel-irons, shaft and gearing, a hollow post, as 13, pulley 26, spring 30, and cord 28, connected to said spring and secured to the gate, substantially as and for the purpose set forth.

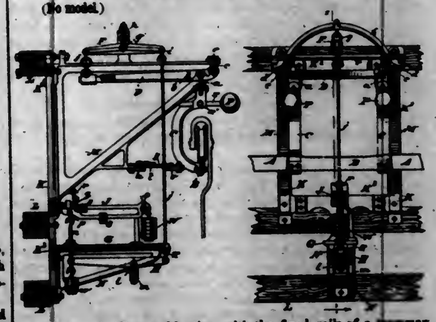
3. The gate 10 and hollow axle 15, cut away, as shown, and supported in bearings 18, combined with shaft 19, wheel-irons and gearing, and arms 20, mounted upon shaft 19 and provided with stops at their lower end, as 40, and stops 21 and 25, substantially as set forth.



4. In combination with the gate, the rod and spring 23 and 42, bolt 23, stops 21, arms 20, shaft 19, and wheel-irons and gearing, substantially as set forth.

5. The gate provided with a latch-bolt connected to rod 23, in combination with handle 45, rod 44, shaft 19, and arms 20, connected with said rod 23, substantially as set forth.

6. A vertically-swinging gate pivoted upon a hollow axle suitably supported in bearings and provided with means for securing it closed, in combination with a weighted end rail, as 11 12, shaft 19, provided with arms co-operating with said hollow axle and with stops affixed to the gate, wheel-irons, as 32, and gearing connecting said wheel-irons and shaft 19, substantially as set forth.



7. In a vertically-swinging gate, a hollow axle mounted in bearings and serving as the pivot for the gate, in combination with a weighted end rail, wheel-irons and actuating gearing, and a hollow post provided with a pulley near its top, a spring, and a cord connecting the spring with the gate and coacting with the pulley, substantially as set forth.

411,506. **CHAMFER-CUTTER.** CHESTER MATTSON, Minneapolis, Minn. Filed May 13, 1889. Serial No. 310,562. (No model.)

Claim.—The combination, with the cutter-head provided with the oppositely-inclined and alternately-arranged plane surfaces upon its periphery, of the right and left hand knives provided with the inclined cutting-edges, and with the inclined wings projecting beyond the body of the knives, and provided also with an inclined cutting-edge, substantially as described.

411,507. **WEIGHING-SCALES FOR SUSPENSION TRAMWAYS.** WILLIAM J. MILLER, Mamaroneck, N. Y., assignor to E. & T. Fairbanks & Company, St. Johnsbury, Vt. Filed July 1, 1889. Serial No. 316,294. (No model.)

Claim.—1. The combination, with the fixed rails of a tramway and a system of compound levers, of a movable rail and a supporting-frame therefor suspended beneath the terminal lever of the compound-lever system in such manner as to be free to move or sway laterally and said frame counterbalanced to cause the movable rail to gravitate to a position directly beneath its point of suspension.

2. The combination, with the fixed rails of a tramway and a system of compound weighing-levers, of a movable rail, two supporting-frames for the opposite ends thereof bent to one side of the vertical plane of the rail and suspended directly thereover from the terminal lever of the compound-lever system, and a counter-weight for said frame projecting to the opposite side of the vertical plane of the rail and connected to the frames through the medium of an adjustable connection, whereby its position may be shifted to bring the center of gravity of the suspended rail and its frames into the vertical plane of the rail and thereby cause the movable rail to gravitate to a position directly beneath its points of suspension.

3. The combination, with the fixed rails A A of a tramway and a terminal lever D and scale-beam J of a compound-lever weighing system, of a movable rail B, its suspension-frames C C, links *a a*, suspending them from the lever D, and counter-weights P P, adjustably connected to said frames through the medium of bars *x x*.

4. The combination, with the fixed rails of a tramway and a system of compound weighing-levers, of a movable rail and its supporting-frames suspended beneath the terminal lever of said compound-lever system and counterbalanced to bring the center of gravity of the suspended structure in the vertical plane of the movable rail, and stay-bars connecting the movable rail to a fixed part in order to limit its swaying movement and retain it in line with the fixed rails.

5. The combination, with the fixed rails of a tramway, of a movable rail B, its suspension-frames C C, terminating over it and counterbalanced to bring their center of gravity into the vertical plane of the movable rail, and the terminal lever D of the system of compound weighing-levers formed with two arms spread apart at their fulcrumed ends and suspended on a fulcrum-axis extending parallel with the vertical plane of the movable rail, and the suspension-frames of said rail connected to said arms of the lever adjacent to their fulcra and the arms of the lever united at its opposite or free end and there connected to the next lever of the compound-lever system.

411,508. **POSTAL PACKET.** MICHAEL NEWKLEW, Vienna, Austria-Hungary. Filed June 18, 1889. Serial No. 314,143. (No model.) Patented in France Dec. 5, 1888, No. 194,551; in England Dec. 5, 1888, No. 17,771; in Austria-Hungary Feb. 2, 1889, No. 47,419 and No. 497, and in Belgium May 29, 1889, No. 86,253.

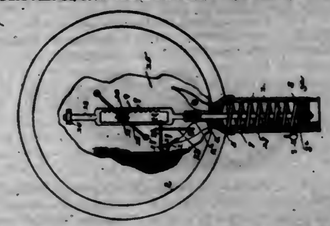
Claim.—1. The combination, with a box provided at or near its upper edge with interior locking flanges or ledges, of a cover provided on its under side with similar flanges or ledges arranged relatively to the box flanges or ledges, so as to permit a slight endwise motion of said cover, and a locking pin or pins arranged relatively to the cover and box, so as to engage the locking-flanges thereof and lock the same together, or vice versa, when an endwise movement in the proper direction is imparted to the cover, as described.

2. The combination, with a box provided at or near its upper edge with interior locking flanges or ledges, of a cover provided on its under side with similar flanges or ledges, so as to permit a slight endwise motion of said cover, the flanges at one end being constructed to interlock, a locking pin or pins arranged relatively to the cover and box-flanges at the opposite end, so as to engage said flanges and penetrate into or through a hole or holes in the end of the box, according to the position of the cover thereon, and a sealing flap or flaps connected with the cover or the box and adapted to fold over the locking-pin hole or holes, substantially as and for the purposes specified.

3. The combination, with a box provided interiorly and near its upper edge with a locking-frame *a*, having a hole or holes in the same plane and in its opposite end bars and a hole or holes in one end of the box registering with that or those in the corresponding frame end bar, of a cover provided with a similar frame shorter in one direction than the box-frame to permit a limited endwise motion of the cover on the box, the end bars of the cover-frame being provided with a locking pin or pins adapted to fit into the corresponding holes in the end bars of the box-frame, substantially as and for the purposes specified.

4. The combination, with a box provided interiorly and near its upper edge with a locking-frame *a*, having a hole or holes in the same plane and in its opposite end bars and a hole or holes in one end of the box registering with that or those in the corresponding frame end bar, of a cover provided with a similar frame shorter in one direction than the box-frame to permit a limited endwise motion of the cover on the box, the end bars of the cover-frame being provided with a locking pin or pins adapted to fit into the corresponding holes in the end bars of the box-frame, and a sealing flap or flaps for sealing the pin opening or openings in one end of the box, substantially as and for the purposes specified.

411,509. **HAT-RIMS.** CHARLES P. PIKE, Boston, Mass. Filed Mar. 5, 1889. Serial No. 302,413. (No model.)



Claim.—1. The combination, substantially as set forth, of the ear-loop, the hinged arm, the trumpet-mouth with the lip of which the end of the ear-loop first engages or past which it snaps to form a catch, and the second catch within the trumpet-mouth with which the end of the ear-loop finally engages, as described.

2. The combination of the setting, the elastic or spring ear-loop, the hinged spring-arm, the trumpet-mouth on the hinged arm, against the inner face or wall of which the end of the ear-loop abuts when the two are brought together, and a catch within the interior of the trumpet-mouth to which the end of the ear-loop is directed by the walls of the trumpet-mouth when the loop and spring-arm are further pressed together, and with which the end of the spring ear-loop engages, substantially as set forth.

3. The combination, with the setting and ear-loop, of the hinged arm having the trumpet-mouth thereon, the interior of the trumpet being formed with a curved or horizontal portion *c'*, against which the end of the ear-loop abuts when the two are brought together, and a shoulder *c''*, to which the end of the ear-loop is directed as the loop and arm are further pressed together and with which the end of the ear-loop engages by snapping past it, substantially as set forth.

411,510. **STEAM-GAGE.** CHARLES H. RILEY, Southport, Conn. Filed June 14, 1888. Serial No. 314,204. (No model.)

Claim.—1. In a combined steam and vacuum gage, the combination of a pipe or cylinder, the casing at the upper end of the same having a graduated dial, the vertically-movable piston having the upwardly-extending piston-rod provided with a frame having a rack-bar on one side, the shaft journaled in the dial and having a hand or pointer at its front end and at its rear end a pinion engaging the said rack-bar, a coiled spring arranged in the cylinder and bearing against the upper side of the piston, and a spring connected to the rear side of the dial and arranged to bear in an upward direction against the frame attached to the piston-rod, substantially as and for the purpose set forth.

2. In a combined steam and vacuum gage, the combination of a pipe or cylinder having a laterally-extending cock near its lower end and perforations at its upper end, the casing at the upper end of said cylinder containing a graduated dial, a shaft journaled centrally in said dial and in a keeper upon the rear side of the latter and having a hand or pointer at its front end and a pinion at its rear end, a piston arranged in the cylinder and having an upwardly extending stem or rod, a frame connected adjustably to said stem or rod and having a rack-bar meshing with the pinion and an upward extension confined in a suitable guide or keeper, a coiled spring arranged in the cylinder and adapted to bear downwardly against the piston, a spring mounted upon a stud extending rearwardly from the dial and having laterally-extending arms bearing, respectively, against a fixed point and against the under side of a pin extending rearwardly from the frame attached to the piston-rod, and a keeper to limit the upward movement of the said spring-arm, all combined and operating substantially as and for the purpose set forth.

3. The combination of a pipe or cylinder, the piston having the upwardly-extending stem, the springs, the vertically-movable frame having a rack-bar, a shaft carrying the hand or pointer and a pinion meshing with said rack-bar, and a right and left hand threaded nut or coupling-sleeve connecting the vertically-movable frame with the piston-rod, substantially as and for the purpose set forth.

4. The combination of the cylinder, the vertically-movable piston having annular oil-groove and a perforation in its upper side communicating with said groove, the spring, the upwardly-extending piston-rod, the rack-bar connected with the latter, and the transverse shaft carrying the pointer and a pinion engaging the rack-bar, substantially as set forth.

411,511. WORK-BENCH. SAMUEL A. SEAT, MORGAN W. PERKINS, and JOHN T. TOOLSON, Hematite, Mo. Filed June 14, 1888. Serial No. 314,214. (No model.)

Claim.—1. A work-bench consisting of a base-plate, a rotary plate supported thereby, and a supporting-arm projecting from the rotary plate, as set forth.

2. The combination of the base-plate, the rotary plate supported thereby and having a supporting-arm extending from its outer side, and the set-screw mounted in the base-plate and adapted to bind on the rotary plate, as set forth.

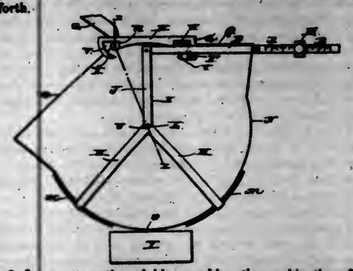
3. The combination of the base-plate, the rotary plate supported thereby, the supporting-arm projecting from the rotary plate, and the spindle at the free end of the supporting-arm, as set forth.

4. The combination of the base-plate having an annular groove B, the rotary plate fitting in said groove and having an annular shoulder I, and the retaining-plate fitting over said annular shoulder and secured to the base-plate, as set forth.

411,512. ICE-CREEPER. CYRUS H. SHAMBOW, St. Cloud, Minn. Filed June 21, 1888. Serial No. 315,092. (No model.)

Claim.—1. An ice-creeper consisting of a flexible metal band having its middle portion bent to fit around the edge of the toe end of a sole and the edges of said sole, a series of separate lugs A^3, flanged therefrom and adapted to extend under the sole and provided with spurs and lips a^3, inwardly projecting from the upper edge of said band, and means to connect the ends of said band, substantially as described.

2. An ice-creeper consisting of a flexible metal band having its ends adjustably united together and bent to rest flatwise against the edge of a boot-sole, and having a series of separate lugs A^3, adapted to extend under said sole, and spurs on said lugs, in combination with means, as set forth, whereby it is adapted to be secured to a boot, substantially as described.



411,513. DEVICE FOR PREVENTING HORSES FROM KICKING. HARRY W. BROOK, Monmouth, Ill. Filed Apr. 29, 1889. Serial No. 308,047. (No model.)

Claim.—The combination, with the rings C on the shafts and the rings D on the saddle of the usual harness, of the strap B, adapted to be passed through the mouth of the horse and over his head, and thence through said rings and over his rump, whereby the horse is prevented from kicking, substantially as described.

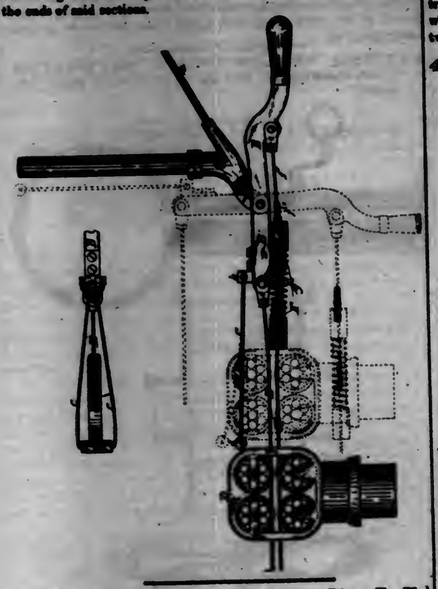
411,514. GRAIN-WEIGHING MACHINE. DANIEL WEBB, Washington, Iowa. Filed Apr. 3, 1889. Serial No. 305,816. (No model.)

Claim.—1. In an automatic weighing-machine, the combination of the supporting-blocks, a bifurcated scale-beam, the two arms at one end of which are mounted pivotally upon said supporting-blocks, a frame mounted pivotally between the outer ends of said arms, a box or hopper pivoted in said frame, and pins or detents upon said box or hopper to engage recesses in the supporting-blocks, substantially as set forth.

2. In an automatic weighing-machine, the combination of a pair of supporting-blocks having recesses near each end, a bifurcated scale-beam mounted upon said supporting-blocks, a frame pivoted between the outer ends of the arms at one end of said bifurcated scale-beam, segmental plates connecting the lower ends of downwardly-diverging arms of the sides of said frame, a box or hopper mounted pivotally in the said frame, said hopper having a central transverse partition, a segmental bottom, and transverse slots in the bottoms of its compartments adjacent to said partitions, and pins or detents extending laterally from the pivoted hopper to engage the recesses at the ends of the supporting-blocks, and thus retain the hopper when it is tilted to a position in which the slot in the bottom of either of its compartments registers with the space between the segmental plates of the hinged frame, substantially as herein described, and for the purpose set forth.

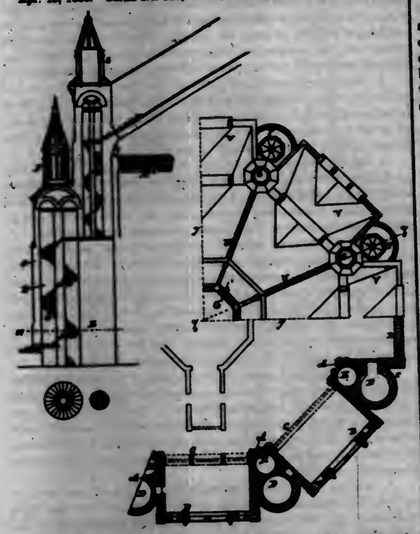
3. The combination of the scale-beam, the frame pivoted at one end of the latter, the box or hopper mounted pivotally in the said frame, centrally-arranged pins or rollers extending laterally from the upper edges of said box or hopper, and the block or blocks supporting the scale-beam and provided at their ends with inwardly-facing curved hooks, and near the inner ends of said hooks with shoulders or recesses to engage the said pins or rollers, substantially as and for the purpose herein set forth.

4. The combination of the blocks having the inwardly-facing curved hooks and the shoulders or recesses near the inner ends of the said hooks, the bearing-plates extending laterally from the said blocks, the scale-beam provided at one end with two parallel arms having laterally-extending pivots mounted upon said bearing-plates, the adjustable weight upon the outer arm of the scale-beam, the frame pivoted to the opposite ends of the parallel arms of the same, the box or hopper mounted pivotally in the said frame, said hopper having a segmental bottom, a central transverse partition, and transverse slots in the bottoms of its compartments adjacent to said partitions, the segmental plates at the lower end of the pivoted frame, and the laterally-extending pins or rollers at the upper edge of the box or hopper, substantially as and for the purpose herein set forth.



5. The combination of the supporting-blocks, the scale-beam mounted upon said blocks and having an adjustable weight at one end, the pivoted frame at one end of the scale-beam, the box or hopper mounted pivotally in the said frame, the pins or rollers at the upper edge of the hopper adapted to engage the hooks and shoulders or recesses at the ends of the supporting-blocks, segmental plates at the lower end of the pivoted supporting-frame adapted to close, alternately, the slots in the bottoms of the compartments of the oscillating box or hopper, and the trough or chute arranged below the latter between the said segmental plates, substantially as and for the purpose herein set forth.

411,515. CASH-CARRIER. WILLIAM H. ALBAUGH, Mansfield, Ohio, assignor to the Barr Cash and Package Carrier Company. Filed May 14, 1889. Serial No. 310,731. (No model.)

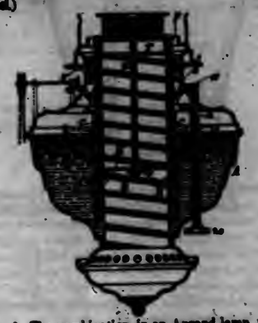


Claim.—1. The combination, substantially as hereinbefore set forth, with the lower or longer wire in a cash-carrier apparatus of the nature described, and with the operating-lever, of a buffer composed of a tube of rubber slipped over said wire.

2. The combination, substantially as hereinbefore set forth, of the operating-lever, the wire loop attached to the shank thereof, the lower track-wire secured to said loop, and the tubular buffer seated against the loop.

3. The buffer herein described, composed of two sections of rubber tubing connected by an intermediate coiled spring which clasps the ends of said sections.

411,516. BUILDING. PETER W. ARMBRUST, Chicago, Ill. Filed Apr. 15, 1889. Serial No. 307,287. (No model.)

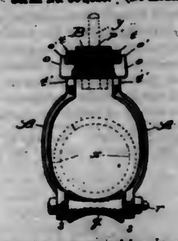


Claim.—1. A building constructed with exterior apartments, the walls of which extend in from the exterior walls and form V-shaped spaces or recesses between the exterior walls, in combination with a truss-support for the roof, having its footings on the inner ends of such V-shaped walls, and a dome G', uniting the upper ends of such truss-support, as and for the purpose specified.

2. A building constructed with V-shaped recesses in its interior walls, and apartments formed between such V-shaped walls, and a truss-dome and spire supported upon the inner ends of the V-shaped walls, as and for the purpose specified.

3. A building constructed with V-shaped recesses in its interior walls, and compartments formed between such V-shaped walls, and a truss-dome and spire supported on the inner ends of the V-shaped walls, and the said recessed walls supported by masonry-work, having two circular openings, as and for the purpose specified.

411,517. ARGAND LAMP. LEWIS J. ATWOOD and FREDERICK W. TUSEY, Waterbury, Conn., assignors to the Plume & Atwood Manufacturing Company, same place. Filed Mar. 6, 1888. Serial No. 266,542. (No model.)



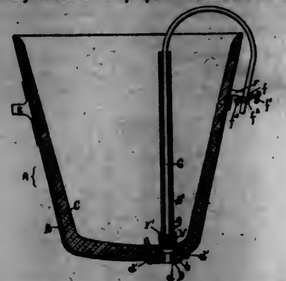
Claim.—1. The combination, in an Argand lamp, with the reservoir and thimble or nut and wick-raising screw, of a tube around the wick, a gear-wheel around the wick-tube, and a collar attached to the wick-tube and resting upon the top of the reservoir, and a pinion for acting upon said gear-wheel to revolve the wick-tube and wick-raising thimble or nut, substantially as set forth.

2. The combination, in an Argand lamp, with the reservoir, central air-tube having a screw-thread upon the same, and the wick-raising thimble or nut, of a wick-tube around the wick, a collar around the wick-tube, and a projection 10, passing to below the top edge of the reservoir for holding the wick-tube and collar down against the lifting action of the wick-raiser and wick, substantially as set forth.

3. The combination, in an Argand lamp, with the reservoir, the air-tube having a screw-thread thereon, and the wick-raising thimble or nut, of a wick-tube surrounding the wick, a collar at the upper end of the reservoir and connected to the wick-tube, a projection for holding down the collar against the lifting action of the wick-raiser, the gear-wheel around the wick-tube, and a pinion for rotating the same, and the wick-tube and wick-raiser, substantially as set forth.

4. The combination, with the Argand burner having a central air-tube and a foraminous skirt and flame-spreader, of a flat horizontal air-distributer having a cylindrical upturned rim made in one therewith and adapted to fit removably within the central air-tube and to receive carbonaceous material, and a rod passing through and attached to the flat air-distributer, the parts being removable from the air-tube, and a stationary stop for the lower end of the rod, substantially as set forth.

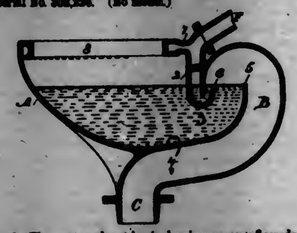
411,518. PIPE-HANGER. JOHN GILLIS, Des Moines, Iowa. Filed Mar. 27, 1889. Serial No. 304,923. (No model.)



Claim.—A pipe-hanger comprising, in combination, a stirrup formed with side pieces A, secured together toward their lower ends by a bolt r, a roller q on the bolt between the side pieces, openings f in the side pieces toward their upper ends, a yoke B, having lateral projections e to enter the said openings, sockets e^2 in the projections e, to receive the upper sides of the said openings, and means for suspending the yoke to a support, substantially as described.

411,519. TAP-BUSHER. JAMES K. GRIFFITH, Philadelphia, Pa. Filed Mar. 1, 1889. Serial No. 301,895. (No model.)

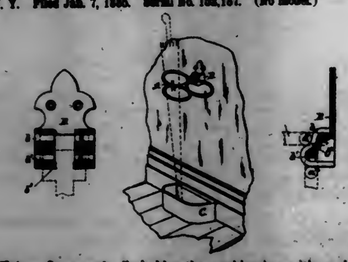
Claim.—1. In a tap-nozzle, a tubular vent-bushing having at its breech or inner end a recessed enlargement of its cavity surrounded



by dome-shaped walls and crowned by an orifice provided with a valve-seat, substantially as and for the purposes hereinbefore described.

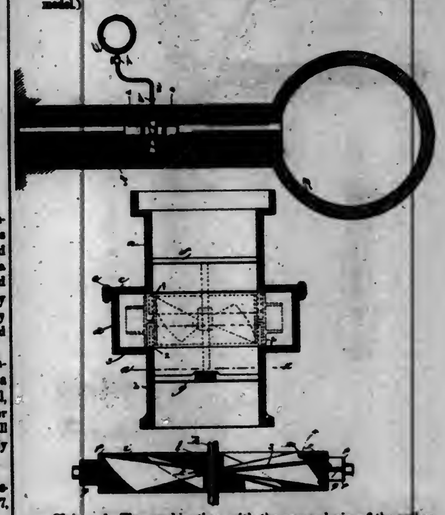
2. In a tapping-nozzle, the combination of an inwardly and centrally tapering ping-valve and a tubular vent-bushing having at its breech or inner end a recessed enlargement of its cavity surrounded by dome-shaped walls and crowned by an orifice provided with a flaring seat for said valve, said valve and orifice being so proportioned that when the valve is only partially lifted out of the orifice they may afford a gate having an area of escape at least as great in capacity as the delivering capacity of said bushing's nozzle, substantially as and for the purposes hereinbefore described.

3. In a tapping-nozzle, the combination of a tubular vent-bushing having at its breech or inner part two valve-seats separated by a dome-wall surrounding an enlarged cavity, the whole formed integral, and a spile-ping valve having a surface adapted to normally register and fit in the former of said seats, but on the dissolution of the wall of said dome to register and seat in the second thereof, substantially as and for the purposes hereinbefore described.



411,520. WATER-CLOSET. EDWARD HANMANN, Brooklyn, assignor to the J. L. Mott Iron Works, New York, N. Y. Filed Mar. 7, 1889. Serial No. 302,256. (No model.)

Claim.—1. The water-closet basin having an overflow-dam 5 and discharge-pipe B, and a water-supply pipe in the back wall of the basin, between the basin and the overflow-pipe B, and the ejector at the lower end of the water-pipe and opening upwardly toward the dam 5, substantially as set forth.



2. The combination, in a water-closet basin having a flushing-rim, of an overflow-dam 5, extending up from the bottom of the basin, a discharge-pipe B, a water-supply pipe E in the back wall of the basin, between the overflow-pipe and the basin, a branch pipe leading to the flushing-rim, and an ejector at the bottom of the water-supply pipe, the mouth of which is elongated and is directed upwardly toward the discharge-dam, substantially as and for the purposes set forth.

411,521. UMBRELLA-HOLDER. SAMFORD B. HASKELL, Albany, N. Y. Filed Jan. 7, 1889. Serial No. 256,167. (No model.)

Claim.—In an umbrella-holder, the combination, with a swinging bracket A, provided with the lateral pintles c^3 and c^4, as herein described, of the hinge-piece B, provided with inwardly-projecting flanges formed of the reversed curves b, b', and b^2, as and for the purposes herein specified.

411,522. VENTILATING APPARATUS. LUKE J. HOPE and JOHN T. HOPE, Kansas City, Mo. Filed Aug. 9, 1887. Serial No. 246,426. (No model.)

Claim.—1. The combination, with the sewer-drain, of the soil or ventilating pipe communicating therewith, the dual separable tubular sections constituting a continuous part of said pipe and having external box-flanges thereon to form an inclosing-case, an air-fan journaled within said pipe, and a motor-wheel located within the external flange-case and sustained from the axle of said fan, substantially as described.

2. In drain or ventilating pipes, the combination, with the dual tubular separable sections having external box-flanges thereon to form an inclosing-case, of an air-fan journaled within the tube, and a motor-wheel located within the external flange-case and sustained from the axle of said fan, substantially as described.

3. In drain or ventilating pipes, the combination, with the dual tubular separable sections having external box-flanges thereon to form an inclosing-case, of an air-fan pivotally sustained within and from said sections, and a motor-wheel secured about the rim of said fan and located within the external flange-case, substantially as described.

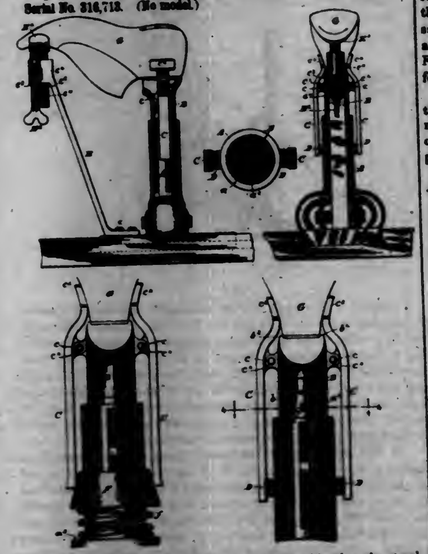
4. The combination, with the ventilating-pipe, of an air-fan having a motor-wheel arranged about the rim thereof and an inclosing-case for the same, said case consisting of dual separable sections united at their opposite tubular terminals to the ventilating-pipe and secured apart at their contiguous ends by external box-flanges projecting from said sections and forming a hollow chamber, said fan being pivotally sustained within and from said sections, and the motor-wheel being located within said hollow chamber, substantially as described.

5. The combination, with the sewer-drain, of the soil and ventilating pipe communicating therewith and having branch or waste pipes discharging into said ventilating-pipe, an air-fan located in said ventilating-pipe above or beyond the discharge-outlets from said waste-pipes, and suitable mechanism to positively actuate said fan, whereby the vitiated air may be withdrawn from said waste-pipes and soil-pipe, substantially as described.

6. The combination, with the sewer-drain, of the soil and ventilating pipe communicating therewith and having branch or waste pipes discharging into said ventilating-pipe, an air-fan located in said ventilating-pipe above or beyond the discharge-outlets from said waste-pipes, a motor-wheel arranged about the rim of said air-fan, an inclosing-case for said wheel, and suitable inlet and outlet ports in said case for the admission and discharge of the motive agent operating said wheel, substantially as described.

7. The combination, with the sewer-drain, of the soil and ventilating pipe communicating therewith and having branch or waste pipes discharging into said ventilating-pipe, the dual tubular sections constituting a continuous part of said pipe and having external box-flanges thereon forming an inclosing-case, said sections being united with said ventilating-pipe above or beyond the discharge-outlets from the waste-pipes, an air-fan pivotally sustained within and from said sections, and a motor-wheel secured about the rim of said fan and located within the flange-case, substantially as described.

8. In ventilating apparatus, the combination, with the casing, of an air-fan sustained thereby and having inclined vanes, a peripheral drum secured to said vanes, and a motor-wheel inclosed within said casing and having a projecting ring-flange attached to said drum, substantially as described.

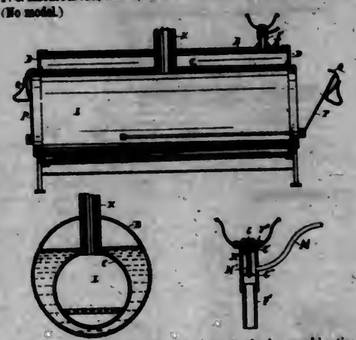


411,523. POLISHING AND WAXING STAND FOR SAD-IRONS. HUBERT H. HULL, Jersey City, N. J. Filed Aug. 21, 1888. Serial No. 283,379. (No model.)

Claim.—1. In a combined polishing and waxing stand for sad-irons, a sheet-metal body having substantially flat top and supporting-flanges the edges of which are bent upon themselves to re-enforce said flanges and form longitudinal recesses, in combination with a layer of wire-gauze and a layer of cloth, each covering a portion of said top of the body and both having their edges inserted in said recesses of the flanges and secured therein, substantially as and for the purpose described.

2. In a combined polishing and waxing stand for sad-irons, a sheet-metal body having a substantially flat top and supporting-flanges the edges of which are bent upon themselves to re-enforce said flanges and form longitudinal recesses, in combination with a layer of wire-gauze and a layer of cloth, each covering a portion of said top of the body and both having their edges inserted in said recesses of the flanges, and a series of barbs or indentations formed in said bent portions of the flanges for securing said edges of the two layers, substantially as and for the purpose described.

411,524. HEELING-MACHINE. GEORGE W. JOHNSON, Chicago, Ill., assignor of one-half to William B. Jones, same place. Filed July 6, 1889. Serial No. 316,713. (No model.)



Claim.—1. In a heeling-machine, and in combination, the standard A, provided at its upper end with a reduced portion a, a pin a^3, projecting from the upper portion of said standard, and a sleeve B, fitting over said projection a, and having a hole in its lower face fitting over the pin a^3, whereby it is prevented from displacement, said sleeve being provided with a flat top surface to receive the shoe-last G, substantially as described.

2. The combination, with the toe-supporting standard E, provided with an apertured lateral enlargement or head d', of the toe-rest E', provided with a shank e^4, fitted to a hole in the head, and an adjusting-screw e^5, also fitted to the head and arranged to adjust the toe-rest vertically, substantially as described.

3. In combination, in a heeling-machine, a suitable standard having a reduced portion at its upper end, a sleeve B, fitting over said reduced portion and provided with a flat top surface for the reception of the shoe-last, a pin a^5 on the standard A, fitting a corresponding recess in the sleeve-rest, whereby the same is prevented from turning, gripping-arms C C, pivoted to the sleeve-rest, their upper ends extending above said sleeve bearing against the sides of the last, springs bearing upon the lower ends of said arms for holding them normally pressed against the last, and a vertically-adjustable rest, as E', adapted to support the toe of the last, substantially as described.

411,525. DEVICE FOR STEAMING FOOD FOR STOCK. GEORGE F. C. KLOEPFINGER, Toledo, Ohio. Filed Mar. 12, 1888. Serial No. 267,070. (No model.)

Claim.—1. In a device for steaming food, the combination, with the boiler A, of the filling-pipe F, connected therewith, a spring safety-valve connected to the filling-pipe, said safety-valve consisting of the screw-plug F', formed with the cross-bar H, valve-disk G, stem G', threaded at its lower end to receive the nut G'', and a coil-spring H', surrounding the stem and bearing upon the under side of the bar H and upper side of nut G'', and the steam-pipe M, connected to the pipe F at a point intermediate the length of the same, substantially as and for the purpose set forth.

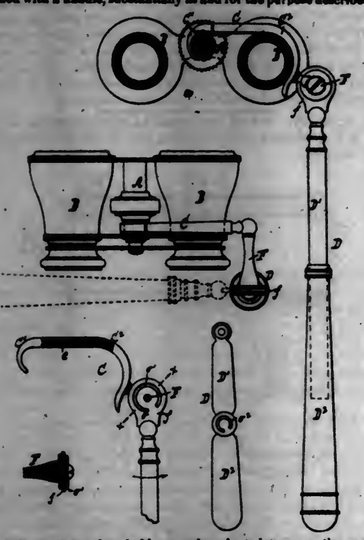
2. In a device for steaming food, a furnace, doors to the openings thereof having a spring-catch and lug formed of a single piece of metal, formed with a horizontal portion to support the door when open, and a vertical portion to hold the same closed, as and for the purpose set forth.

411,526. PENCIL-SHARPENER. WARREN H. LARSON, Bridgeport, Conn. Filed Feb. 23, 1888. Serial No. 264,919. (No model.)

Claim.—1. The combination, with the sheet-metal frame having at its end an opening for the insertion of the pencil to be sharpened, of a number of cutting-blades on the sides of the frame and between the edges of the said sides and projecting radially inward toward the line of insertion of the pencil and arranged in pairs to act upon the pencil when rotated both back and forth, substantially as described.

2. A pencil-sharpener comprising a sheet-metal frame having an end opening for the insertion of the pencil, and its side slit longitudinally, and the edges along the slit turned in radially with relation to an inserted pencil and arranged to act in pairs upon a pencil when rotated axially in either direction, substantially as shown and described.

3. A pencil-sharpener consisting of a bent sheet-metal blank having a plurality of inwardly-turned blades arranged thereon, a hole for the insertion of the pencil to be sharpened, an eyelet flanged over the edges of said hole, and a suitable handle, all arranged as described, and for the purpose set forth.



4. The combination, with the open blade-carrying frame, of the eyelet secured within the opening at the top of the frame, whereby the body of the pencil is protected as against abrasion, substantially as set forth.

411,527. OPERA-GLASS HOLDER. EMIL P. METTOWITH, Ridgefield, N. J., assignor to Levy, Dreyfus & Co., New York, N. Y. Filed Dec. 14, 1888. Serial No. 293,961. (No model.)

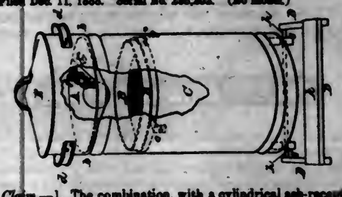
Claim.—1. In an opera-glass holder, a yoke adapted to grasp the center screw and either barrel of the opera-glass, combined with a handle, substantially as and for the purpose described.

2. In an opera-glass holder, a yoke made in sections, one adapted

to grasp the center screw and the other either barrel of the opera-glass, and an adjusting device connecting said sections of the yoke, combined with a handle, substantially as and for the purpose described.

3. In an opera-glass holder, a yoke adapted to grasp the center screw and either barrel of an opera-glass, combined with a handle, and a pivot uniting said yoke and handle, substantially as and for the purpose described.

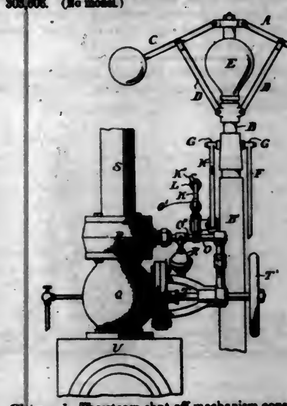
4. In an opera-glass holder, a yoke adapted to grasp the center screw and either barrel of the opera-glass, combined with a handle which is attached at or near one end of said yoke for supporting the opera-glass from a lateral direction, substantially as shown and described.



411,528. GRAIN-DRILL. WINFIELD W. MULLEN and FRANCIS M. MULLEN, Bunker Hill, Ind. Filed Mar. 14, 1888. Serial No. 306,381. (No model.)

Claim.—1. In a grain-drill, the combination of the frame, the hopper, the seed-cups, the feed-rolls, the driving mechanism, the cut-off, and feed-regulator F, formed with a rack on its rear edge, the segmental pinion F', pivoted to the plate F⁵ on the lower edge of the hopper and formed with the handle f', and the set-screw f^3, extending through a curved slot in the plate F⁵ into a screw-threaded perforation in said handle, substantially as described, and for the purpose specified.

2. The combination, in a grain-drill, with the feed mechanism, substantially as described, of the cut-off and feed-regulator F, having a rack on its rear edge, the pivoted segmental pinion F', engaging therewith, and provided with the indicator f^3, formed on the top side thereof, and a part in front of said indicator having an indicator-gage thereon, substantially as set forth.

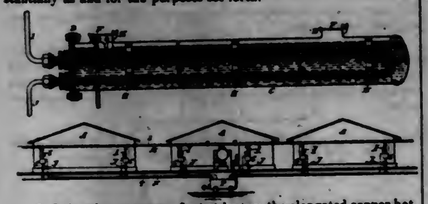


411,529. ASH-SIFTER. CHARLES L. FOSTER, Philadelphia, Pa. Filed Dec. 11, 1888. Serial No. 293,262. (No model.)

Claim.—1. The combination, with a cylindrical ash-receptacle C, of the hopper A and screen B, the bottom cleats formed with notches g g, and the supporting-frame D D D, as described, and for the purpose set forth.

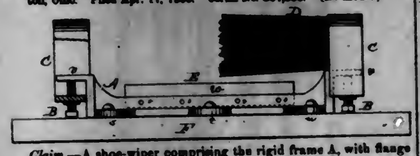
2. The combination of the hopper A, as described, with the ball e and chain f, with the cylindrical ash-receptacle C and screen B, as and for the purpose set forth.

411,530. AUTOMATIC STOP MECHANISM FOR STEAM-ENGINES. WILLIAM H. PFOTZ, Philadelphia, Pa. Filed Mar. 16, 1888. Serial No. 303,005. (No model.)



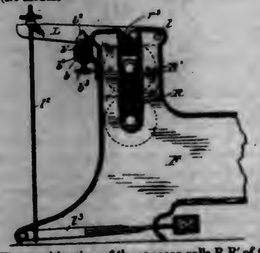
Claim.—1. The steam shut-off mechanism consisting of cross-bar G, attached to vertically-moving bar B of the governor mechanism, rod H, pivoted at one end thereto, bell-crank I I', pivoted to stud J, rod K, loosely secured at one end in block L, so as to turn freely therein, the latter being hinged by arm L' to part I' of the bell-crank, and said rod K being provided with key M, sleeve N, adapted to receive one end of rod K and provided with a slot M' to receive key M, lever O, with its rod O', adapted to open and close a valve in shell P of the engine mechanism, substantially as described.

2. The steam shut-off mechanism consisting of cross-bar G, attached to vertically-moving bar B, of the governor mechanism, rod H, pivoted at one end thereto, bell-crank I I', pivoted to stud J, rod K, loosely secured at one end in block L, so as to turn freely therein, the latter being hinged by arm L' to part I' of the bell-crank, and said rod K being provided with key M, sleeve N, adapted to receive one end of rod K and provided with a slot M' to receive key M, lever O, with its rod O', adapted to open and close a valve in shell P of the engine mechanism, and weight R, attached to rod O' to restrain and steady the action of my mechanism and to bring the parts back to place when the pressure from the governor is removed, substantially as described.



411,531. APPARATUS FOR HEATING HOT-HOUSES. JAS RENLEY, Brooklyn, N. Y. Filed Dec. 6, 1887. Serial No. 257,060. (No model.)

Claim.—1. In apparatus for heating hot-houses, the hot-water receptacles C C and the steam-pipes G therein, combined with the furnace and boiler, the main steam-pipe M, leading from said boiler and extending along the house, the return-pipe N for condensed steam, pipes I, connecting the pipes G with pipe M, pipes J, connecting the outlet end of pipes G with pipes N, the tank P, connected with pipes N, the main water-pipe S, connected with the pump, and the water-pipes V W, leading, respectively, to and from said receptacles C C, substantially as and for the purpose set forth.

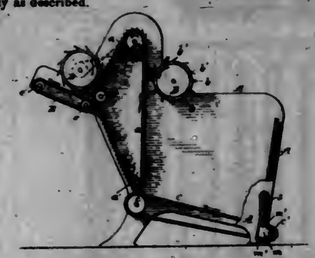


2. In heating apparatus for hot-houses, the elongated copper hot-water receptacle C, having covered sections E on its upper side and a cast-metal end D, provided with stuffing-boxes, combined with the steam-pipe G therein, pipes I J, connected with ends of pipe G, main supply and return pipes in communication with pipes I J, supply and escape pipes V W for water, the float-valve e within said receptacle to close pipe V, and mechanism, substantially as described, for supplying the steam and water, substantially as set forth.

411,532. SHOE-WIPER. JOHN RESSER and FRANK RESSER, Dayton, Ohio. Filed Apr. 17, 1888. Serial No. 307,333. (No model.)

Claim.—A shoe-wiper comprising the rigid frame A, with flange and lateral projections, the clips C embracing said projections, and binding-screws in said clips to engage the same, and brush material held within said parts, substantially as shown and described.

411,533. WOOL-WASHING MACHINE. FREDERICK G. SARGENT and ALLAN C. SARGENT, Graniteville, Mass. Filed Jan. 17, 1887. Serial No. 224,643. (No model.)

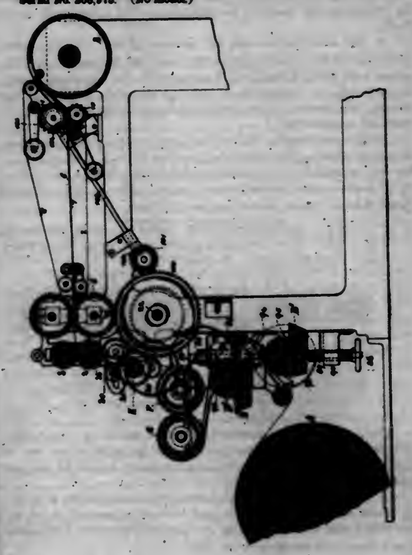


Claim.—1. The combination of the squeeze-rolls R R' of the wool-washing machine, one of which is provided with an elastic absorbent jacket of felt, yarn, or similar material, the weighted levers L L, adapted to compress the said rolls together, and the elastic stop-blocks b' b', adapted to gradually counteract the pressure of the weighted levers L L as the squeeze-rolls approach each other, substantially as described.

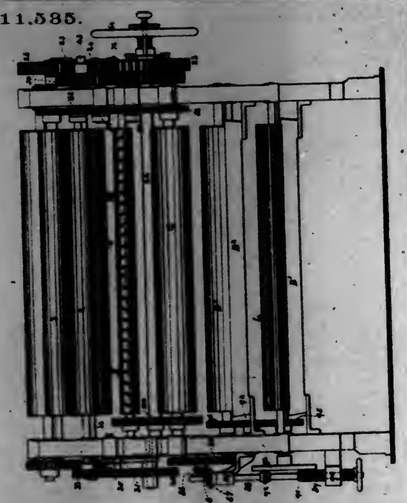
2. The combination of the squeeze-rolls R R' of the wool-washing machine, one of which is provided with an elastic absorbent jacket of felt, yarn, or similar material, the weighted levers L L, adapted to compress the said rolls together, the elastic stop-blocks b' b', adapted to gradually counteract the pressure of the weighted levers L L as the squeeze-rolls approach each other, and the hand-wheel and the adjusting screw and plate b^3 b^4, adapted to vary the position of said stop-blocks, substantially as described.

411,534. FEEDING MECHANISM FOR WOOL-WASHING MACHINES. FREDERICK G. SARGENT and ALLAN C. SARGENT, Graniteville, Mass. Filed Jan. 17, 1887. Serial No. 224,645. (No model.)

Claim.—1. The combination of the receiving-box, the feeding-apron a, provided with teeth or spurs and arranged to move vertically upward over roller a^3, and thence downward over roller a^4, and the apron C, forming the bottom of the receiving-box and arranged with one end adjacent to the vertical face of apron a and with its upper surface inclining upward from the opposite end toward the former from a horizontal plane, whereby the surplus wool dropping thereon from apron a will tend to roll away from the foot of the latter by the action of gravity toward the farther side of the receiving-box, substantially as described.



2. The combination of the receiving-box, the apron C, forming the bottom thereof and having its roller c' adjustable up and down therein and adapted to incline the upper surface of the apron downward toward the same with relation to a horizontal plane, and the apron a, provided with teeth or spurs and arranged to move vertically upward over roller a^2 and downward over roller a^3, substantially as described.



3. The combination of the receiving-box, the apron C, forming the bottom thereof, the apron a, provided with teeth or spurs and arranged to move vertically upward over roller a^3, and thence downward over roller a' and over the intermediate roller a^2, which latter is arranged to bring the faces of the apron on each side of it at an angle with each other in passing over it and to open its teeth apart, and the apron E, revolving contiguous to and taking the fiber directly from said opened teeth of apron a and opposite to said intermediate roller, substantially as described.

4. The combination of the receiving-box, the apron C, forming the bottom thereof, the apron a, provided with teeth or spurs and arranged to move vertically upward over roller a^3, and thence downward over roller a' and over the intermediate roller a^2, which latter is arranged to bring the faces of the apron on each side of it at an angle with each other in passing over it and to open its teeth apart, the doffer D, arranged to act upon the fiber carried by apron a above said roller a^3, and the apron E, revolving below said doffer and contiguous to and taking the fiber directly from said teeth of apron a, where so opened apart and opposite to said intermediate roller a^2, substantially as described.

411,535. DAMPENING AND FEEDING MECHANISM FOR PRINTING-MACHINES. WALTER SCOTT, Plainfield, N. J. Filed Mar. 30, 1888. Serial No. 268,973. (No model.)

411,535.

Claim.—1. The combination, with the feeding-rolls and the changeable gearing for varying the speed of such rolls, of a dampening-roll and connecting-gearing between the feeding-rolls and the dampening-roll for supplying to the paper the proper quantity of moisture regardless of the speed with which the paper is passed into the press, substantially as set forth.

2. The combination, with the feeding-rolls and a dampening-roll and heating-roll, of gearing connecting the dampening and the heating roll with the feeding-rolls, whereby the heating and feeding rolls are caused to move at the same surface speed, and changeable gearing between the feeding-rolls and the press for varying the length of sheet fed into the press at each revolution of the same, substantially as set forth.

3. The combination, with the dampening-rolls and and the gearing connecting the same, of a face-wheel upon the shaft of one of the dampening-rolls, a revolving shaft crossing such face-wheel, a friction-pinion upon said shaft, and an adjusting-screw for moving the shaft and friction-pinion nearer to or farther from the axis of the face-wheel for regulating the speed of the dampening-roll, substantially as set forth.

4. The combination, with the dampening-roll L and face-wheel 93, of the shaft 88 and gearing for revolving the same, a friction-pinion upon the said shaft and in contact with the face-wheel, a tubular screw 89, and connection for moving the shaft 88 endwise and varying the position of the friction-pinion upon the face-wheel, substantially as set forth.

5. The combination, with the dampening-roll and the face-wheel, of a shaft crossing the face-wheel, supports for such shaft, and a pinion upon said shaft, and adjusting mechanism for varying the position of the pinion on the face-wheel and regulating the quantity of water supplied to the paper, substantially as specified.

411,536. MICROMETER-GAGE. LABOT S. STARRETT and CHARLES P. FAY, Athol, Mass.; said Fay assignor to said Starrett. Filed May 4, 1889. Serial No. 309,561. (No model.)

Claim.—1. In a micrometer-gage, the combination of an internally-threaded barrel and the rotary spindle provided with a pair of hinged and externally-threaded jaws, substantially as and for the purpose set forth.

2. In a micrometer-gage, an internally-threaded barrel, a revolving sleeve, and a rotary spindle provided with a recess, in combination with a split screw formed of two pivoted adjustable jaws located in said recess, for the purpose set forth.

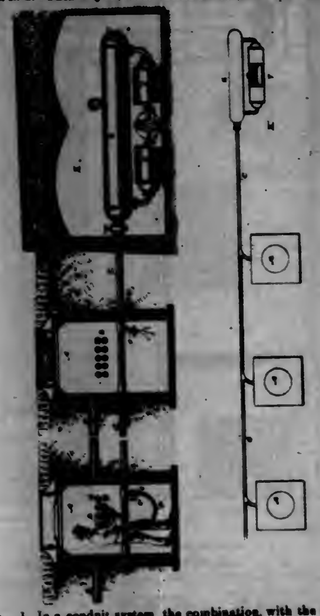
3. In a micrometer-gage, a solid internally-threaded barrel graduated externally, and a revolving sleeve beveled and peripherally graduated at its inner end, in combination with a rotary spindle carrying two adjustable screw-threaded jaws working within said barrel, and a plunger adapted to connect and disconnect such threaded parts, substantially as set forth.

4. In a micrometer-gage, the stationary anvil and threaded graduated barrel with the revolving spindle and sleeve, in combination with the screw-threaded spring-actuated jaws pivoted on said spindle, and the axially moving plunger with its terminal knob, for the purpose set forth.

411,537. CALIPERS OR DIVIDERS. LABOT S. STARRETT, Athol, Mass. Filed May 4, 1889. Serial No. 309,560. (No model.)

Claim.—1. In dividers or calipers, the pivoted arms, provided with a connecting wing or brace and an external adjusting-nut, in combination with a spring adapted to be compressed by said nut, and with a locking-nut between the arms for holding the parts firmly when adjusted, substantially as set forth.

2. In dividers or calipers, the pivoted arms A B and the brace or wing F, passing through both arms and secured to one by a suitable clamp, in combination with the nuts G H, screwing upon the threaded end of said wing, and with the coil-spring J, surrounding said wing and compressible between said nuts into a recess in the leg A, substantially as set forth.



3. In dividers or calipers, the pivoted arms, the arc-shaped wing circular in cross-section, passing transversely through them, and an adjusting-nut, in combination with a stud set in a recess in the arm B and perforated for passage of the wing through it, and provided with a threaded stem and a thumb-nut thereon for clamping the arm in position, substantially as set forth.

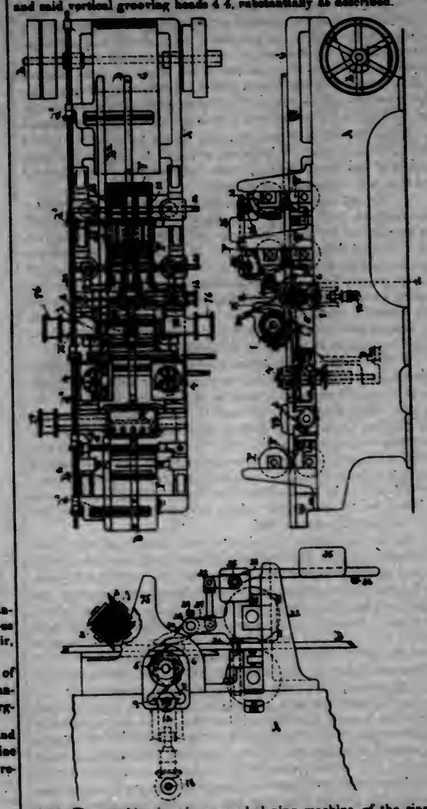
411,538. DENTAL PLATE. JOHN J. STEDMAN, La Porte, Ind. Filed May 20, 1889. Serial No. 311,404. (No model.)

Claim.—The method of preparing partial dentures having a vulcanite base and retaining-clasps thereon, which method consists in fitting the clasps to the teeth in the mouth, taking an impression with the clasps *in situ*, removing the impression and clasps together, forming a counter-model and transferring the clasps thereto in parting the mold and applying the soft rubber, setting the teeth, and vulcanizing as usual, substantially as described.

411,539. UNDERGROUND CONDUIT FOR ELECTRIC WIRES. GEO. A. WHEELER, New York, assignor of one-fourth to Sylvester P. Denison, Brooklyn, N. Y. Filed July 30, 1888. Serial No. 281,909. (No model.)

Claim.—1. In a conduit system, the combination, with the man-holes and ducts, of a compressed-air main having outlets at various points along the conduit that discharge a limited portion of the air, for the purposes described.

2. In a conduit system, the combination, with the man-holes, of a compressed-air main extending through or along the line of man-holes and having regulated air-outlets in the man-holes for discharging a limited volume of the compressed air.



3. In a conduit system, the combination, with the man-holes and ducts, of a compressed-air main extending through or along the line of man-holes and having in the man-holes air-outlets adapted to receive a hose, as set forth.

411,540. PLANING-MACHINE. SOLOMON A. WOODS and JOHN B. THOMAS, Boston, Mass., assignors to the G. A. Woods Machine Company, of Massachusetts. Filed Dec. 8, 1888. Serial No. 292,616. (No model.)

Claim.—1. The combination, in a wood-planing machine, of a single long planing-cylinder 1, provided with knives arranged for surfacing the lumber and cutters 2, arranged to form the upper portion of tongues upon the inner edges of two strips of board at the same time, a solid bed C beneath said cylinder 1, and the horizontal shaft 6, extending from one side of said bed transversely across below the path of the lumber and provided at its inner end with a set of cutters 2, adapted to operate in conjunction with the corresponding cutters of said cylinder 1, substantially as described.

2. The combination, in a wood-planing machine, of a single long planing-cylinder 1, provided with knives for surfacing the lumber and cutters 2, arranged to form the upper portion of tongues upon the inner edges of two strips of board at once, a solid bed C beneath said cylinder 1, a feed-roll F above said bed, and the horizontal shaft 6, extending transversely across below the path of the lumber between said feed-roll and cylinder, and provided with a set of cutters 2, adapted to operate in conjunction with the corresponding cutters of said cylinder 1, substantially as described.

3. The combination, in a wood-planing machine, of the feed-roller F above the bed, the vertical grooving cutter-heads 4 4, arranged to groove the outer edges of two strips of lumber at once, the single long planing-cylinder 1, provided with knives for surfacing the lumber and cutters 2, arranged to form the upper portion of tongues upon the inner edges of two strips of board at once, a solid bed C beneath the same, and the horizontal revolving shaft 6, extending transversely across below the path of the lumber and provided with a set of cutters 5, adapted to operate in conjunction with the corresponding cutters of said cylinder 1, said planing-cylinder 1 and shaft 6 being located and mounted adjacent to each other between said feed-roll F and said vertical grooving heads 4 4, substantially as described.

4. The combination, in a wood-planing machine, of the single long planing-cylinder 1, provided with knives for surfacing the lumber and cutters 2, arranged to form the upper portion of tongues upon the inner edges of two strips of board at once, a solid bed C beneath said cylinder 1, a presser-bar 20 on the feed-in side of the same, and the horizontal shaft 6, extending from one side of said bed transversely across below the path of the lumber, provided with a set of cutters 5 near its inner end, adapted to operate in conjunction with the corresponding cutters of cylinder 1, and with said shaft mounted upon plate 8, arranged to be adjusted independently of the upper cylinder 1 and its cutters 2 transversely of and entirely beneath the bed to bring the cutters 5 of the shaft 6 and of planing-cylinder 1 into adjustment with each other, substantially as described.

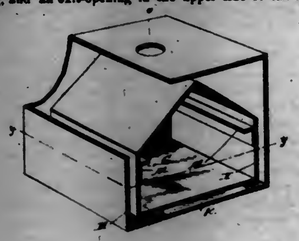
5. The combination, in a wood-planing machine, of the single long planing-cylinder 1, provided with knives for surfacing the lumber and cutters 2, arranged to form the upper portion of tongues upon the inner edges of two strips of board at once, a solid bed C beneath said cylinder 1, the horizontal shaft 6, extending from one side of said bed across below the path of the lumber and provided with a set of cutters 5 near its inner end, adapted to operate in conjunction with the corresponding cutters of cylinder 1, and the plate 8, located beneath the path of the lumber, mounted on a guideway transversely of the frame and carrying said shaft 6, and arranged to be drawn out of said frame through one side thereof, substantially as described.

6. The combination, in a wood-planing machine, of the shaft 6, extending horizontally and transversely from one side of the machine-bed across beneath the path of the lumber through the machine and provided with cutters 2, for working the lumber, the plate 8, mounted on girt 9 and arranged to be adjusted lengthwise thereon, the girt 9, arranged in vertical guideways in the machine-frame and provided

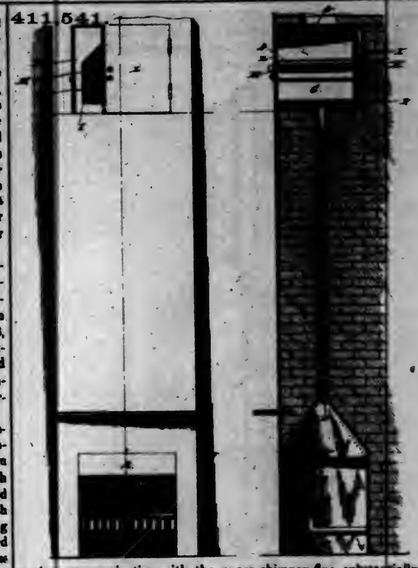
with adjusting-screws 16 16, bevel-gears 17 17 19 19, and horizontal adjusting-shaft 18, projecting at one end beyond the machine-frame and mounted therein, substantially as described.

7. The combination, in a wood-planing machine, of the single long planing-cylinder 1, provided with surfacing knives and cutters 2, arranged to form the upper portions of tongues upon the inner edges of two strips of board at once, a solid bed C beneath the same, the yielding pressure-bar 20 on the feed-in side of the same, the feed-roll F above said bed the horizontal shaft 6, extending transversely across the frame beneath the path of the lumber, between said pressure-bar and feed-roll, and provided with a set of cutters 5, adapted to operate in conjunction with the corresponding cutters of cylinder 1, and a yielding pressure plate or finger 30, arranged to bear on the upper surface of the board opposite thereto and between said pressure-bar and feed-roll, substantially as described.

8. The combination, in a wood-planing machine, of the long planing-cylinder 1, provided with surfacing knives and cutters 2, its yielding pressure-bar 20, feed-roll F, arranged to bear on top of the lumber, a yielding pressure plate or finger 30, arranged to bear thereon between said pressure-bar and feed-roll and pivoted upon shaft 28, link 32, pivoted lever 33, connected thereby to said finger 30 and extending horizontally above said feed-roll, and the shaft 6, provided with cutters 5, arranged to operate on the under surface of the lumber beneath said pressure-finger 30 and in conjunction with the corresponding cutters on cylinder 1, substantially as described.



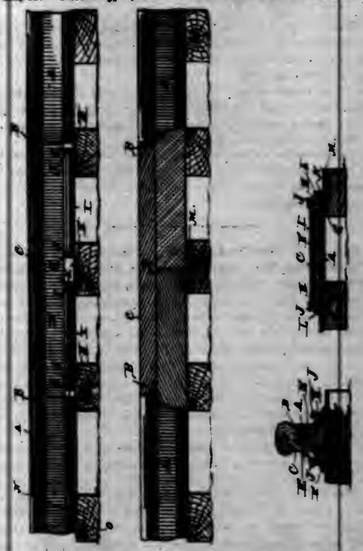
9. The combination, in a wood-planing machine, of the long planing-cylinder 1, provided with knives arranged for surfacing the lumber and cutters 2, arranged to form the upper portion of tongues upon the inner edges of two strips of board at once, a solid bed C beneath said cylinder, the horizontal shaft 6, extending from one side of said bed transversely across below the path of the lumber and provided with cutters 2, adapted to operate in conjunction with the corresponding cutters of cylinder 1, and the under surfacing cylinder located toward the feed-out end of the machine from shaft 6 and arranged to dress the lower face of the lumber after it has passed the cutters of said shaft, substantially as described.



10. The combination, in a wood-planing machine, of cutter heads or cylinders 1 and 5, attached on horizontal shafts above and below the path of the board through the machine, and provided with cutters 2 5, adapted to tongue and divide a board into two strips at a single operation, the vertical cutter-heads 4 4, placed on the feed-out side of said horizontal cutter-heads and adapted to groove the outer edges of said strips, and the supporting-bar 42, arranged to enter between said strips opposite to said vertical heads and sustain said strips in the same relation to each other throughout their length while being so grooved on their outer edges, substantially as described.

11. The combination, in a wood-planing machine, of cutter heads or cylinders 1 and 5, attached on horizontal shafts above and below the path of the board through the machine and provided with cutters 2 2, adapted to tongue and divide a board into two strips at a single operation, the vertical cutter-heads 4 4, placed on the feed-out side of said horizontal cutter-heads and adapted to groove the outer edges of said strips, and the supporting-bar 42, arranged to enter between said strips opposite to said vertical heads and also bear upon the upper surfaces of the same and sustain said strips in the same relation to each other throughout their length while being so grooved on their outer edges, substantially as described.

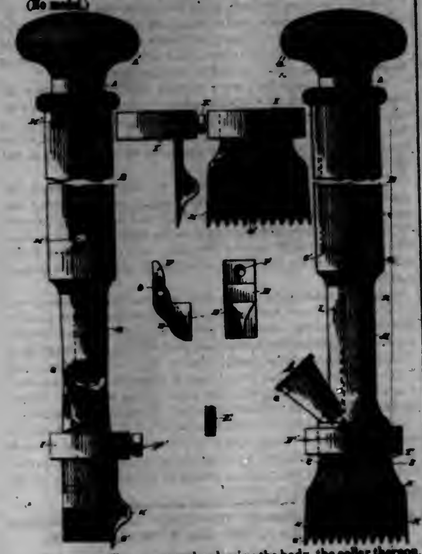
411,541. HEATING APPARATUS. LEWIS ACHON and THOMAS HAMILTON, Martinsville, Ohio; said Hamilton assignor to Charles H. Irwin, Wilmington, Ohio. Filed Mar. 6, 1889. Serial No. 302,492. (No model.)



Claim.—A domestic heating apparatus or oven comprising a rectangular drum or casing embedded in a chimney in an upper apartment of a building or dwelling-house, an oven inclosed by the said drum, except at the front, where it is provided with a door, said oven having sloping upper sides that meet so as to form a longitudinal ridge at the top thereof, a flue connecting an opening in the lower side of the drum or casing with a fire-place in a lower apartment of the building, and an exit-opening in the upper side of the drum or

casing communicating with the upper chimney-flue, substantially as set forth.

411,542. RAIL-JOINT. REUBEN M. AGEE and EDWARD LAWE, Canton, Mo. Filed May 31, 1889. Serial No. 312,605. (No model.)



Claim.—1. The combination of the rails and the cap fitting over the ends thereof, with the bolts passed through the flanges of the rails and the cap, the securing-nuts on the said bolts, the washer-plates slipped over the ends of the bolts, and the jam-nuts on the ends of the bolts adapted to be turned up against the washer-plates, as set forth.

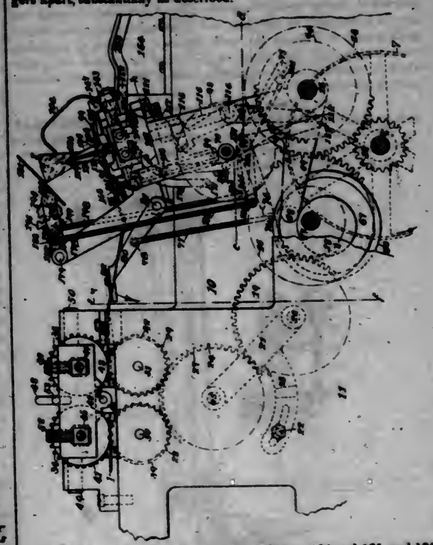
2. The combination of the rails having elongated horizontal notches in their tops at their ends, the cap engaging the said notches and fitting over the ends of the rails and provided with elongated openings in its flanges, the bolts rigidly fitted in the flanges of the rails

and projecting up through the openings in the flanges of the cap, the securing-nuts on the bolts, the washer-plates mounted on the bolts above the securing-nuts, and the jam-nuts mounted on the bolts above the washer-plates, as set forth.

411,543. CARPET TACKING AND STRETCHING MACHINE. JACOB ALBER, Seymour, Ind. Filed Dec. 24, 1888. Serial No. 294,722. (No model.)

Claim.—1. The carpet-tacker having the body, the collar thereon, the serrated stretching-blade having its upper end fitted in one side of the collar, and the clamping-screw to secure said blade and collar together and to the body, substantially as described.

2. The carpet-tacker comprising the tubular body having its lower end swelled to form the foot N, the latter being recessed and open on its opposite sides and at its lower end, the jaws D, pivoted in the side recesses, having the die D' formed in the opposing faces of their lower meeting ends, and having the vertical arms O at their upper ends, the springs E, having their inner ends arranged in recesses S in the shoulders T of the foot, and their outer ends arranged in the recesses P of the arms O, and the hammer A in the bore of the tubular body and having the reduced lower portion B', adapted to enter the die D' and force the jaws apart, the said tubular body being further provided near its lower end with the tack guide or receiver G, communicating with its bore, the collar I, vertically movable on the foot, the serrated stretching-blade having its upper end fitted in one side of the collar, and the clamping-screw to secure said blade and collar to the foot, substantially as described.



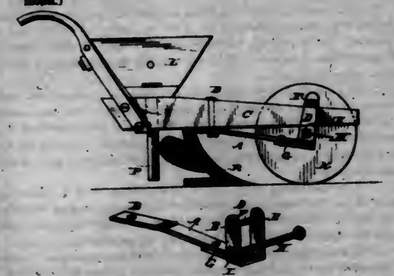
411,544. PAPER-BAG MACHINE. EDWARD R. CLARKSON, Hartford, and GEORGE MORRISON, Bridgeport, Conn. Filed Feb. 18, 1889. Serial No. 300,233. (No model.)

Claim.—1. The combination of the presser-plate 85, fastened to the upper ends of the vertical arms 86 and 87, and the cams 92 and 93, attached to the lower ends of those arms and alternately raising and lowering those arms and that presser-plate, all substantially as described.

2. The combination of a folding bed, as the upper surface of the carriage 70, provided with the diagonal ledges 96 and 99, the presser-plate 85, provided with the diagonal ledges 96 and 97, and two oppositely disposed pairs of fingers 124 and 125 and 126 and 127, so constructed and worked as to press and crease a tucked-paper tube on diagonal lines coincident with the outer edges of the four ledges, and thus to draw part of that tube down and out into a box-like form, all substantially as described.

3. The combination of the rocking carriage 70, the slides 108 and 109 reciprocating thereon and carrying the two pairs of fingers 124 and 125 and 126 and 127 therewith, and the cam 110, and intermediate mechanism, substantially as described, working those slides, all substantially as described.

4. The combination of two pairs of fingers 124 and 125 and 126 and 127, a shaft provided with an arm rocked by a cam, and intermediate mechanism, substantially as described, between that shaft and those fingers, all combined and operating to spread each pair of fingers apart, substantially as described.

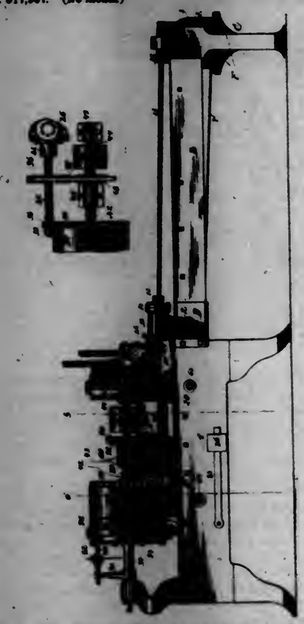


5. The combination of two pairs of fingers 124 and 125 and 126 and 127, the swivels 144 and 145, having those pairs of fingers pivoted thereto, respectively, a shaft provided with an arm rocked by a cam, and intermediate mechanism, substantially as described, between that shaft and those swivels, all combined and operating to swing those fingers at right angles to the direction of their spreading, all substantially as described.

6. The combination of the cam 100, the arm 102, worked by that cam and rocking on the shaft 103, and the long hook-like arm 104, worked by the arm 102 and operating, substantially as described, to raise the forward part of a tucked-paper tube into the upright position shown in Fig. 4, and afterward to draw the forward wall of the box-like form of Figs. 5 and 6 down into the form of the forward end of the diamond form of Figs. 9 and 10, all substantially as described.

7. The combination of the drop-plate 181 and two cams, and mechanism, substantially as described, between each of those cams and that drop-plate, whereby the drop-plate receives a compound sweeping and pressing motion, all substantially as described and shown.

411,545. GUANO-DISTRIBUTER. ANDREW CHARLES, Jr., Bahia, Ga., assignor of two-thirds to Andrew V. McVicker and James H. McVicker, both of same place. Filed June 22, 1888. Serial No. 315,161. (No model.)



Claim.—1. The combination, with the beam or stock C, of the flat or leaf spring A, having its rear end fixed thereto, yoke D, secured upon the free forward end of the spring and having guiding-arms E E, adapted to loosely engage opposite sides of said beam or stock and prevent lateral play of the spring, and the guide-wheel K, mounted on said yoke, so as to travel in advance of the fixed end of the spring, substantially as specified.

2. The combination, with the beam or stock C, of the flat or leaf spring A, having its rear end fixed thereto, yoke D, secured upon the free forward end of said spring and having parallel guiding-arms E E, adapted to loosely engage opposite sides of the beam or stock and prevent lateral play of the parts, bolt F, connecting the upper ends of guiding-arms E E above the beam or stock, axle-bolt H, extending laterally from said yoke below said beam or stock, and the guide-wheel K, mounted on the extending end of this axle-bolt, substantially as specified.

411,546. MACHINE FOR CUTTING BRICK OR OTHER CLAY PRODUCTS.

WILLIAM R. CUNNINGHAM, Frankfort, Ind., assignor to the Wallace Manufacturing Company, same place. Filed July 13, 1889. Serial No. 317,967. (No model.)

Claim.—1. In a machine for cutting brick or other clay products, a belt or apron driven by a bar or stream of clay, a rotating cutter to cut the bar of clay at intervals, and a motor to drive the cutter, in combination with a nut and screw to govern the valve of the motor, one of which is driven by the movement of the bar of clay, the other by the movement of the cutter, substantially as and for the purposes specified.

2. In a machine for cutting brick or other clay products, the combination of a rotating blade on an arbor, a pinion on such arbor, a gear-wheel which engages with such pinion, a shaft 44, which carries said gear-wheel, a hollow shaft 42, and a pulley 46, substantially as and for the purposes specified.

3. In a machine for cutting brick or other clay products, the combination of an arbor 49, carrying a rotating blade, a revolving casing 37, a fixed casing 34, provided with a cam-groove 56, guide-block 53, mounted on the arbor, and roller 55, for the purpose of giving the arbor and blade a reciprocating movement, substantially as and for the purpose specified.

4. A reciprocating table 71, in combination with a revolving casing 37, a spiral cam on the outside of such casing, and an intermediate device between the table and cam, through which the cam moves the table horizontally, substantially as specified.

5. In a machine for cutting brick or other clay products, a table 71, mounted on vertical guides which move in guideways, in combination with weighted levers 86, substantially as and for the purpose specified.

6. In a machine for cutting brick or other clay products, the combination of a table 71, mounted on horizontal and vertical guides which move in guideways, weighted levers 86, cross-heads 74, supported at its lower end on a track, revolving casing 37, and cam 72, substantially as and for the purposes specified.

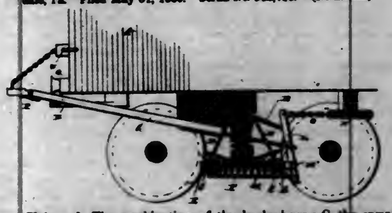
7. In a machine for cutting brick or other clay products, a table 71, in combination with one or more horizontal strips 101, supported by the table, and a delivery-belt 103, substantially as and for the purpose specified.

8. In a machine for cutting brick or other clay products, one or more strips 99, in combination with one or more belts 66, and table 71, substantially as and for the purpose specified.

9. In a machine for cutting brick or other clay products, a circular blade 52, secured to and rotating with an arbor, in combination with a rotating casing 37, which carries the arbor, whereby the blade rotates around the axis of the casing and at the same time rotates on its own axis, substantially as and for the purposes specified.

10. In a machine for cutting brick or other clay products, a circular blade mounted on a rotating arbor, which is supported in a revolving casing 37, in combination with devices, substantially such as described, for giving to the blade a movement in the direction of the movement of the stream or bar of clay to be cut, substantially as and for the purpose specified.

11. In a machine for cutting brick or other clay products, the combination of a nut and screw which engage with each other, one operated by the movement of a bar of clay and the other by devices for rotating a cutter and moving it in the direction of the moving clay for the purpose of causing the cutter and clay to move in the same direction at the same speed, substantially as and for the purpose specified.



12. In a machine for cutting brick or other clay products, a motor which drives clay-working devices, in combination with a screw and nut operated by a stream of moving clay, and arranged to operate the valve of the motor, substantially as and for the purpose specified.

13. In a machine for cutting brick or other clay products, a belt 7, driven by a moving bar of clay, and a second belt 66, in combination with a rotating casing 37, miter-wheels 59 and 60, shaft 61, pinion 62, and gear-wheel 63, substantially as and for the purpose specified.

14. In a machine for cutting brick or other clay products, the combination of a revolving casing 37, provided with a head 38, shaft 39, shaft 44, hollow shaft 42, and arbor 49, carrying a cutter, said arbor being supported by the revolving casing 37 and by an arm 51 on the shaft 39, substantially as specified.

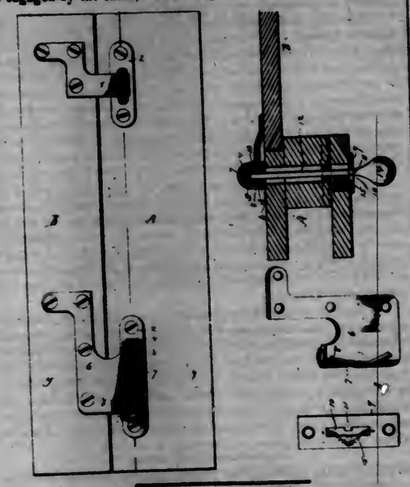
411,547. AUTOMATIC CAR-BRAKE.

JAMES P. DUBLIN, Scottdale, Pa. Filed May 31, 1889. Serial No. 312,711. (No model.)

Claim.—1. The combination of the brake-beams C, the springs F, connecting the same, the lever pivoted on one of the beams C, the link connecting the lower end of the lever with the other beam C, and the sliding push-bar having its inner end pivoted to the upper end of the lever and projecting forward beyond the end of the car, as set forth.

2. The combination of the brake-beams, the lever pivoted thereto, the push-bar pivoted to the lever, the bumper-head pivoted to the end of the push-bar, and the rock-shaft adapted to act on said bumper-head, as set forth.

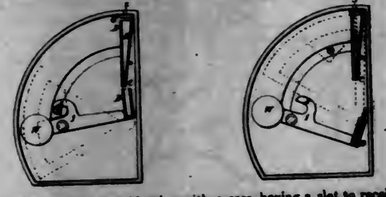
411,548. SHUTTER-WORKER.



GEORGE S. ELLIOTT, Mobile, Ala. Filed June 12, 1889. Serial No. 314,764. (No model.)

Claim.—1. The combination, with a shutter and casing, of hinges by which the shutter is connected with the casing, one of said hinges having a spiral guide thereon, and a latch having connection with the guide whereby the shutter is swung by raising or lowering the latch, substantially as set forth.

2. The combination, with a shutter and casing, of hinges by which the shutter is connected with the casing, one of said hinges having a spiral guide thereon, and a latch pivoted transversely within the casing and having engagement at one end with the guide, a catch for retaining the latch in position, and springs for throwing it behind the catch, substantially as set forth.



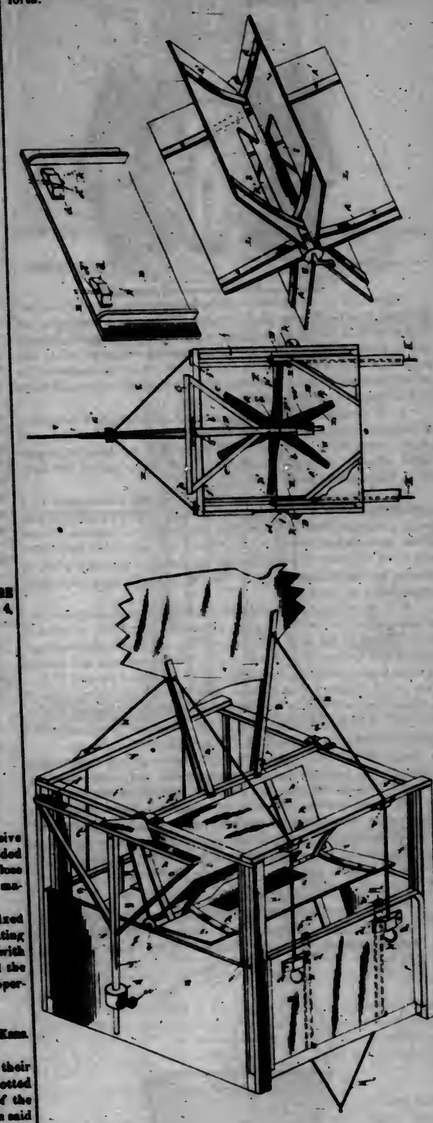
3. The combination, with a slotted plate having a grooved pintle thereon, and a hinge-leaf having a sleeve with a spiral slot mounted on the pintle, and a pivoted latch one end of which extends through the spiral slot and into the groove in the pintle, whereby the leaf of the hinge is swung by the movements of the latch, substantially as set forth.

4. The combination, with a casing having slotted plates on each side thereof, one of said plates having a latch thereon and the other having a grooved pintle, of a shutter having a hinge-leaf secured thereto, said leaf having a sleeve with a spiral slot therein mounted on the pintle, and a latch pivoted in the casing with one end projecting through the groove and spiral slot and the opposite end in position to be engaged by the catch, substantially as set forth.

411,549. MACHINE FOR DISCLOSING ARTICLES IN EXCHANGE FOR A COIN.

PERSEVAL EVERITT, New York, N. Y. Filed Feb. 4, 1889. Serial No. 298,679. (No model.)

Claim.—1. In combination with a case having a slot to receive a coin, a lever-shutter, and a weighted coin-operated lever provided with a notch or hook, serving to engage a pin on such shutter to close the same until released by the action of a coin deposited in the machine.

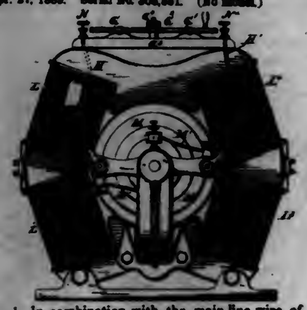


2. In combination, the case having a coin-receiving slot, a fixed bracket D, constituting one wall of the coin-chute, and a gravitating lever E, constituting the other wall of the chute, and provided with a ledge *e'* at its top adapted to grip and detain between itself and the bracket improper foreign substances inserted and to prevent the operation of the disclosing mechanism.

411,550. WINDMILL.

EDWARD P. HAMBLEN, McPherson, Kans. Filed Apr. 24, 1889. Serial No. 308,371. (No model.)

Claim.—1. In a windmill, the doors D, having the cleats near their upper edges, said cleats being provided with eyes *d'*, and the slotted frame F, in which said doors slide vertically, one at each side of the machine, in combination with an upright vane V, journaled upon said frame and adapted to be depressed by the force of the wind in either of two directions, cords K, leading from said vane over pulleys *p*, mounted upon said frame and passing through said eyes, and weights W upon the lower ends of said cords below said cleats, the whole adapted to be operated substantially as and for the purpose set forth.



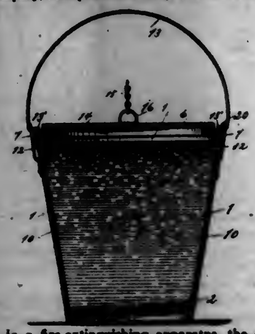
2. In a windmill, the combination, with the frame, the doors D, and the wheel journaled in said frame, of the shaft S', journaled transversely across the top of said frame, the upright vane V, mounted upon said shaft, cords connecting said vane and doors, the pendulum-rod P, keyed to and depending from one end of said shaft, the cross-piece C, also carried by the end of the shaft, braces *c*, connecting the ends of said cross-piece with the body of said pendulum, and the weight W, adjustably mounted on said pendulum, as and for the purpose set forth.

3. In a windmill, an overshot wheel mounted upon a horizontal axis, in combination with a closed box B, in the upper edge of which said axis is journaled, a frame-work mounted upon said box, all sides of which are open, and doors D, adapted to be raised vertically in said frame above said box on either side of said wheel and close the sides, as and for the purpose set forth.

4. In a windmill, the box B, having closed sides and provided with an opening O in its bottom, the inner corners of said box being beveled for the purpose set forth, in combination with an overshot wheel journaled on a horizontal axis in bearings in the upper edge of said box, as set forth.

411,551. REGULATOR FOR SHUNT-WOUND DYNAMOS OR OTHER ELECTRICAL APPARATUS. LEMUEL S. HARRIS, Detroit, Mich. Filed Apr. 27, 1889. Serial No. 308,981. (No model.)

Claim.—1. In combination with the main-line wire of a shunt-machine, a series of wires K K', &c., of different sizes leading to the field-magnet, a switch G, to direct a portion of the current through one or more of said wires to the field-magnet, a resistance-coil D, and a series of wires E C', &c., and a switch G', to direct the residue of the current passing with more or less resistance through any of said wires to the armature, substantially as set forth.



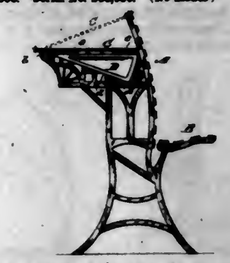
2. In combination with the line-wire A and a series of field-wires of different sizes, a switch-plate G', and successive series of insulated plates arranged in groups of different numbers but equal aggregate width, whereby the switch is connected with all or part of the field-wires, substantially as set forth.

3. In combination with the line-wire A and switch-plate G, a series of field-wires of different sizes, groups of plates I I', &c., the first group connected directly to the field-wires, the next series of one less plates connected by branch wires with all but one of the field-wires, and so on successively with diminishing numbers, but each group in turn occupying a space equal to the full width of the switch-plate, substantially as set forth.

4. In combination with the field-magnet, armature, and line-wire, switch-plates G G', carried on an adjustable switch-bar, a series of wires leading to the field, and plates I I', &c., arranged in groups connecting one or more of said field-wires with the line-wire, and a series of wires leading from the resistance-coil to a series of plates F F', &c., from which a part of the current leads through the switch-plate G' to the armature, whereby the force of the current to the field will be increased or diminished and that of the current to the armature be inversely diminished or increased, substantially as set forth.

5. In combination with the field-magnet and armature of a shunt-machine, a group of wires leading to field and a corresponding group of wires having variable resistance leading to the armature, and switch mechanism connected to said wires, substantially as set forth, so that when there is a maximum of current through the field-magnets there shall be automatically provided a minimum current to the armature, and vice versa, the current to one decreasing as the current to the other increases by a single movement of the switch mechanism, substantially as set forth.

411,552. CHEMICAL FIRE-EXTINGUISHING APPARATUS. CLARENCE B. MACOMBER, Worcester, Mass., assignor to the Worcester Fire Appliance Company, same place. Filed May 6, 1889. Serial No. 309,779. (No model.)



Claim.—1. In a fire-extinguishing apparatus, the combination, with a receptacle for holding fire-extinguishing liquid, provided with a screw-thread upon its upper exterior surface, an inwardly-projecting flange or shoulder, and an upward projection, and a tin-foil or easily-perforated cover adapted to extend over the top of said receptacle, and a screw-ring to screw onto the top of the same to secure the easily-perforated cover on the receptacle and hermetically seal the contents thereof, of a metal case for inclosing said receptacle and detachable therefrom and provided with ears, and a wire handle with bent ends to move out and in in said ears, for the purpose stated, substantially as set forth.

2. In a fire-extinguishing apparatus, the combination, with a receptacle for holding a fire-extinguishing liquid, having a screw-thread upon its upper exterior surface, and an inwardly-projecting flange or shoulder, and a tin-foil or easily-perforated cover, and a screw-ring for securing said cover to the receptacle to hermetically seal the contents thereof, of a metal case for inclosing said receptacle and detachable therefrom and provided with a handle and means for holding the receptacle in said case, and a slip-cover adapted to extend over the easily-perforated cover, and means for automatically removing said slip-cover preparatory to using the apparatus, substantially as set forth.

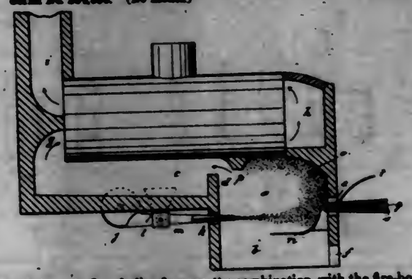
3. In a fire-extinguishing apparatus, the combination, with a receptacle, and a fire-extinguishing liquid hermetically sealed within said receptacle by a tin-foil or easily-perforated cover, and a screw-ring for securing said cover on the top of the receptacle, and a metallic slip-cover to fit over and protect the easily-perforated cover, of a metallic protecting-case for inclosing said receptacle and provided with a handle, and means for securing said receptacle within said protecting-case, substantially as set forth.

4. In a fire-extinguishing apparatus, the combination, with a receptacle, and a fire-extinguishing liquid hermetically sealed within said receptacle by a tin-foil or easily-perforated cover, and a screw-ring for securing said cover on the top of said receptacle, and a metallic slip-cover provided with a chain or cord for engagement with a hook or its equivalent to automatically remove said cover, of a metallic protecting-case for inclosing said receptacle and detachable therefrom and provided with a handle, and means for securing said receptacle within said protecting-case, substantially as set forth.

411,553. SCHOOL-DESK. THOMAS S. MANNING, Vandalia, Mo. Filed Oct. 23, 1888. Serial No. 288,969. (No model.)

Claim.—In a school or other desk, the combination of fixed end supporting-frames having horizontal upper edges, a desk-top exceeding the entire length of said frames and hinged to the outer edge of said frames, and triangularly-shaped brackets hinged on horizontal pivots to the horizontal edges of said frames upon the outside thereof, as shown, whereby the brackets may be raised to hold the desk-top in an inclined position or turned from under the desk-top and the desk-top be held in a horizontal position on the edge of the end supporting-frames when said brackets are thus turned down, substantially as described.

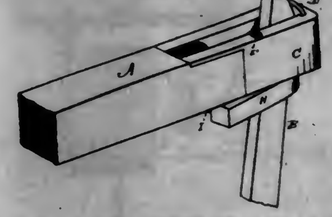
411,554. DULCITINA. GEORGE C. MARSTERS, Brooklyn, N. Y. Filed Feb. 16, 1889. Serial No. 300,122. (No model.)



Claim.—1. In a stringed musical instrument, a top or sounding-board, which is composed of wood, which has a sound-opening, and which has also an opening which is closed by a parchment-like bridge-support, substantially as and for the purposes specified.

2. A stringed musical instrument in which the body is circular, in which the sounding-board is composed of wood, and in which the bridge rests upon a support which is composed of parchment.

3. The combination, with the neck N, of the body A', embracing the imperforate circular wall or hoop *a*, flat imperforate bottom *a'*, and sounding-board *a''*, the hoop, the bottom, and the sounding-board being composed of wood, and the sounding-board being provided with a sound-opening and with a parchment-supported bridge.



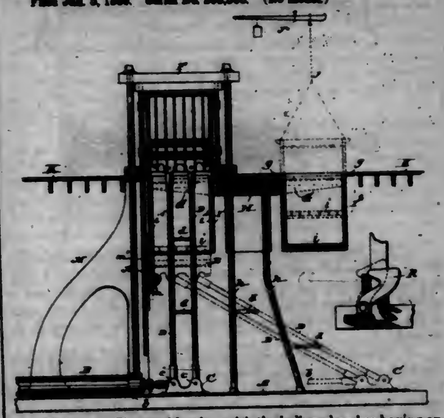
411,555. APPARATUS FOR BURNING COAL AND HYDROCARBON FUEL IN COMBINATION. ALLAN MACNS, Brooklyn, assignor to Herbert H. Sanborne, trustee, New York, N. Y. Filed Sept. 5, 1888. Serial No. 284,668. (No model.)

Claim.—1. In a boiler-furnace, the combination, with the fire-box provided with an upwardly-curved deflecting-plate located about midway of the fire-box, a pulverized-fuel injector communicating with the rear portion of the fire-box opposite the deflecting-plate, and an oil, steam, and air injector communicating with the front of the fire-box on a different plane from that of the pulverized-fuel injector, substantially as described.

2. In a boiler-furnace, the combination, with the fire-box having an arched roof terminating in a depending deflecting-plate located in front of the rear of the fire-box, and an upwardly-curved deflecting-plate located about midway of the fire-box, a pulverized-fuel injector communicating with the rear portion of the fire-box opposite the deflecting-plate, and an oil, steam, and air injector communicating with the front of the fire-box on a different plane from that of the pulverized-fuel injector, substantially as described.

411,556. PICKER-CHECK FOR LOOMS. THOMAS HORTON, Fall River, Mass. Filed June 6, 1888. Serial No. 313,618. (No model.)

Claim.—In a loom, the combination of the lay or batten A, provided with the metallic strap C and buffer D, the check-lever H, pivotally secured to the under side of said lay, spring 1, one end of which bears against said check-lever, and the picker-staff B, substantially as and for the purpose described.



411,557. DOOR-CHECK. WILLIAM D. SCARBOROUGH, Pennington, Tex. Filed June 26, 1889. Serial No. 315,607. (No model.)

Claim.—The combination, in a door-check, of the swiveling tube formed with the circumferential recess *b* and the shoulders *c c* of the sectional confining-box *a*, the pivoted notched rod A, the spring-pin *d*, and the actuating-chain, all constructed as shown and described.

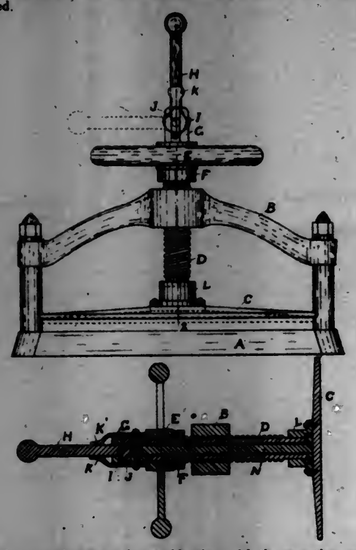
411,558. BALING-PRESS. ANDREW D. THOMAS, Little Rock, Ark. Filed Jan. 5, 1889. Serial No. 295,902. (No model.)

Claim.—1. The combination, with the baling-chamber having appliances for retaining the compressed material therein, the platen, and means for operating the platen, of a turn-table having a series of carrying-boxes said series being movable continuously in one direction past the baling-chamber, substantially as described.

2. The combination of the baling-chamber having appliances for retaining the compressed material therein, the press-platen, and a frame having a series of carrying-boxes, said frame being adjustable to bring any one of its boxes into line with the baling-chamber and platen, and said platen being movable through the carrying-box and into and out of the baling-chamber, substantially as described.

3. The combination of the baling-chamber permanently fixed in position, the platen, and means for operating said platen with the carrying-boxes and their supporting-frame, said boxes being detachable from said frame to enable them and their contents to be weighed, substantially as described.

4. The combination of the baling-chamber permanently fixed in position, the platen, the carrying-boxes, and their movable supporting-frame, said boxes being detachable from said frame to enable them and their contents to be weighed, and said frame being movable to enable the carrying-boxes to be brought into line with said baling-chamber and platen, substantially as described.



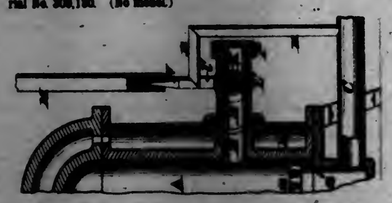
5. The combination of the baling-chamber permanently fixed in position, the platen, and means for operating said platen with the carrying-boxes and their supporting-frame, said boxes being removable laterally from said frame to enable them to be filled at a point without said frame, substantially as described.

6. The combination of the baling-chamber, the platen, the carrying-boxes and their movable supporting-frame, and the outlying platform, said frame and said platform having ways, and said boxes being movable on said ways and removable from said frame to said platform and back again, substantially as described.

411,559. COPYING-PRESS. WALTER B. TREFAIN, New Haven, Conn. Filed Aug. 12, 1889. Serial No. 320,155. (No model.)

Claim.—1. In a copying-press, the combination, with a base-plate

platen and yoke, of a screw passing through the yoke, having a press-shaft passing through its axis and resting upon the platen and operated by a cam pivoted to the upper end of said screw, whereby the pressure is applied and removed, substantially as and for the purpose described.



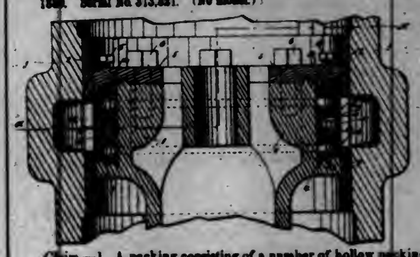
2. In a copying-press, the combination, with the operating-screw having a press-shaft passing through its axis and operated by a cam, of a sleeve forming the upper end of said screw to which said cam is pivoted, said sleeve being threaded to said screw, whereby the wear of the parts may be taken up, substantially as and for the purpose described.

3. In a copying-press, the combination, with an operating-screw having a press-shaft passing through its axis, actuated by a cam pivoted to the upper end of said screw and operated by a lever, and springs fastened to said screw, which clamp and hold said lever in an upright position, substantially as and for the purpose described.

411,560. PROCESS OF ETCHING OR ENGRAVING ON GLASS, &c. FREDERICK WESTERMAYR, London, County of Middlesex, England. Filed Jan. 12, 1888. Renewed May 2, 1889. Serial No. 309,412. (No specimens.) Patented in England May 3, 1888, No. 5,978.

Claim.—The process of etching, consisting of coating the article with an acid-resisting substance, then transferring off a printed design or picture onto the coated surface from transfer-paper, and then dusting over or covering this transferred design with metal leaf or with bronze-powder or other finely-ground powder which will obstruct the passage of light, and subsequently exposing the surface to light and dissolving out such parts of the coating as are not thereby rendered insoluble, then etching out the exposed portions of the surface by means of acids, substantially as described.

411,561. BARREL-BRANDER. MAX WOLF, Cincinnati, Ohio, assignor of one-half to Joseph Huber, same place. Filed May 1, 1889. Serial No. 309,180. (No model.)



Claim.—1. A hot-blast apparatus of the class specified having a brand heated by the furnace, said brand being surrounded by a bonnet having a smoke-pipe, and a branch pipe leading from the latter to the main air-pipe of the apparatus, whereby a forced draft is produced through said bonnet and smoke-pipe, as herein described.

2. The combination, in a hot-blast apparatus of the class specified, of the pipe E, branches K K', brands *k k'*, bonnets L L', pipes *l l'*, leading from said bonnets to a common exit M, and a nozzle N, inserted within said exit, which nozzle is applied to a pipe *n*, that communicates with the common air-pipe C, all as herein described.

3. A hot-blast apparatus of the class specified having a brand heated by the furnace, said brand being surrounded by a bonnet having a smoke-pipe, which pipe has a forced draft, for the purpose herein described.

411,562. PACKING. JOHN ALLAN, Hoboken, N. J. Filed June 11, 1889. Serial No. 313,821. (No model.)

Claim.—1. A packing consisting of a number of hollow packing-rings formed with a slit extending throughout their periphery, and having separated edges movable toward each other, said rings being arranged one above the other, and their peripheral slits opening alternately in opposite directions, substantially as shown and described.

2. A hollow packing-ring 7, having curved sides 12, and one side of its periphery formed with the cylindrical portion 8, the other side of its periphery formed with the cylindrical portion 9, having a circumferential slit 11, with adjacent separated edges 10, movable toward each other, substantially as shown and described.

3. A packing consisting of a number of hollow packing-rings formed with curved sides, and having one side of their periphery formed with a cylindrical circumferential portion, and the other side of the periphery formed with a cylindrical circumferential portion having a circumferential slit with separated edges movable toward each other, substantially as shown and described.

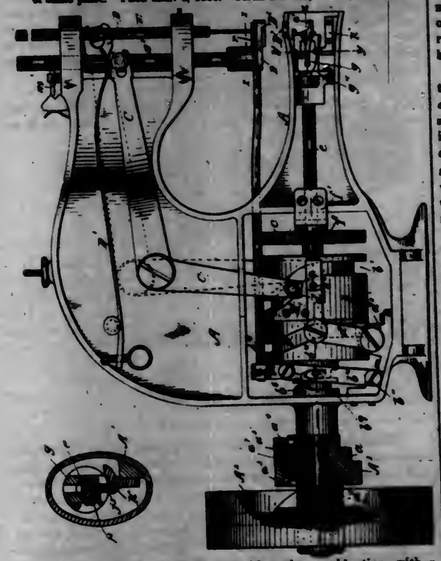
411,563. APPARATUS FOR DISSOLVING AND SUPPLYING LUPULINE TO BEER. RUDOLF ALLERT, Brooklyn, N. Y. Filed Feb. 6, 1889. Serial No. 299,003. (No model.)

Claim.—1. The combination of a steam-jacketed vessel for containing lupuline, having an outlet at its top provided with a filter, an induction-pipe for hot beer having its discharge-opening near the bottom of said vessel, and a goose-neck eduction-pipe connected with said outlet, substantially as set forth.

2. The combination of a steam-jacketed vessel for containing lupuline, provided with an outlet at its top, a filter in said outlet, a goose-neck eduction-pipe connected with said outlet, and an elevated supply-pipe for hot beer extending into said vessel and discharging near the bottom thereof.

411,564. FIFTH-WHEEL FOR VEHICLES. PETER ANDERSON, Fort Wayne, Ind., assignor to Henry G. Olds, same place. Filed July 2, 1889. Serial No. 316,410. (No model.)

Claim.—1. A fifth-wheel for vehicles, consisting of a disk or circular plate revolving within a shouldered ring bolted to the head-block, said disk being securely bolted to a ring or plate revolving within a ring attached to the axle, substantially as and for the purpose described.



2. A fifth-wheel for vehicles, consisting of a plate revolving within a circular chamber on the head-block, said chamber being open at the bottom to permit the free passage of bolts by which said plate is bolted to a similar plate rotating in a chamber on the under side of the axle, substantially as and for the purpose described.

3. A fifth-wheel consisting of a plate rotating within a shouldered ring on the head-block, said plate being bolted to a similar plate on the lower side of the axle, in combination with a bearing plate or ring on top of the axle or bolster, substantially as and for the purpose described.

4. A fifth-wheel for vehicles, consisting of the disk H, rotating within a ring or chamber on the head-block and bolted to the ring O, rotating within a chamber on the lower side of the axle, in combination with the bearing-plate J, having the circular flange extending upward within the circular opening in the plate F, substantially as and in the manner described.

5. In a fifth-wheel, the reach-bracket P, pivotally attached to the axle by the rotating plate O, in combination with the reach-bracket T, rigidly attached to the head-block, substantially as and in the manner described.

411,565. SHOE-TYING MACHINE. ALBERT E. ATER, Boston, Mass., assignor to Francis H. Rotherwas and Isaac P. T. Edmunds, both of same place. Filed Mar. 1, 1889. Serial No. 301,627. (No model.)

Claim.—1. In a shoe-tying machine, the combination, with a horn or work-support, a presser-foot co-operating therewith, cutting mechanism carried by said presser-foot, and a thread-carrying needle, of a knot-tying mechanism composed of a rotating and longitudinally-reciprocating shaft within said horn, a head rotatively engaged with said shaft, a stop whereby said head is prevented from moving endwise with the shaft, a loop-engaging hook pivoted to said shaft and having a connection with the head, whereby it is moved inwardly when the shaft is moved endwise in one direction, and a second loop-engaging hook pivoted to the head and adapted to retain the end of the loop and draw the same through the body of the loop during the endwise movement of the shaft in the opposite direction, as set forth.

2. In a shoe-tying machine, the improved knot-tying mechanism composed of the rotating and longitudinally-reciprocating shaft having an end hook, the head *g*, rotatively engaged with said shaft and prevented from reciprocating therewith, the piece i, pivoted to the shaft and provided with a hook P and with a slot P', engaged with a fulcrum attached to the head, and the spring-controlled hook *j*, pivoted to the head, as set forth.

3. In a shoe-tying machine, the combination of the rotating and reciprocating shaft *c*, the head *g*, rotatively engaged therewith, a stop, as *g'*, whereby said head is prevented from moving endwise with the shaft, the loop-engaging hooks P and *j*, pivoted, respectively, to the shaft and head, one of said hooks being engaged, as described, with a fulcrum in the head, while the other is pressed inwardly by a spring, and a fixed cam whereby the spring-pressed hook is displaced at a given point in the rotation of the head, as set forth.

4. In a shoe-tying machine, the combination, with the shaft *c*, head *g*, and hooks P and *j*, of the link *d*, jointed to said shaft, the lever *d'*, pivoted at one end to a fixed support and at the other end to the link *d*, and a driving-shaft geared to the shaft *c* and having a cam engaged with the lever *d*, whereby the latter is oscillated and the shaft *c* reciprocated, as set forth.

5. In a shoe-tying machine, the combination, with a reciprocating needle, a work-supporting horn, and knot-tying mechanism within said horn, of the presser-foot having an opening, one side of which constitutes the shear-blade b^{15}, the shear-blade Q, pivoted to the presser-foot and co-operating with the blade b^{15}, and mechanism for oscillating said blade Q, as set forth.

6. In a shoe-tying machine, the combination, with a reciprocating needle and knot-tying mechanism, of the presser-foot having the fixed shear-blade b^{15} and the spring-pressed cord-holding plate *r*, the shear-blade Q, pivoted to said foot and pressed downwardly thereon by the plate *r*, and mechanism for reciprocating the pivoted blade, the said plate *r* holding the cord against the upper surface of the blade Q, as set forth.

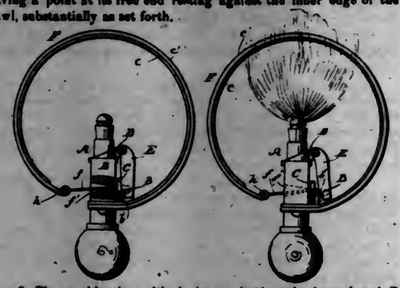
7. In a shoe-tying machine, the combination, with a reciprocating needle and knot-tying mechanism, of the presser-foot having the shear-blade b^{15}, the shear-blade Q, pivoted to the foot, the sleeve or enlargement on the driving-shaft having the cam-grooves connected by an opening b^2, the pivoted lever b^{20}, having a pivoted shoe adapted to run in said grooves, and the rod b^{19}, connecting said lever with the blade Q, as set forth.

8. In a shoe-tying machine, the combination of the driving-shaft, the knot-tying mechanism composed of the shaft *c*, having the hook *d'*, the head *g*, and hooks P *j*, the gears *e f*, connecting the driving-shaft with the shaft *c*, said gear *f* arranged to permit the reciprocating movement of the shaft *c*, means for reciprocating said shaft, the driving-pulley normally loose on the driving-shaft and provided with a projection, as a^2, a collar affixed to said driving-shaft and provided with a spring-impelled key or latch adapted to engage said projection, and a wedge-shaped lever which normally stands in position to retract the key or latch, as set forth.

9. In a shoe-tying machine, the combination of the horizontally-arranged horn or work-support, the horizontally-arranged driving-shaft, the non-reciprocating head *g* in said horn, the horizontal shaft *c*, adapted to move lengthwise through the head and in the horn, and knot-tying devices co-operating with said shaft and head within said horn, said shaft, head, and knot-tying devices being arranged so that the horn is enabled to be contracted in size, so as to be capable of entering the smallest shoes, connections between the shaft *c* and the driving-shaft, whereby the shaft *c* is horizontally reciprocated, the vertically-arranged needle and presser bars provided, respectively, with a needle and a presser-foot, and devices communicating motion from the driving-shaft to the needle and presser bars, as set forth.

10. In a shoe-tying machine, the combination of the horn or work-support, the knot-tying mechanism, the vertically-movable presser-foot D, the presser-bar D^4, having a rib D^4, the gripping-piece *m*, slotted to receive said rib and normally held by a spring in position to permit said rib to move freely, the needle-bar-actuating lever B, and intermediate devices whereby when said lever is depressed the gripping-piece is displaced and caused to lock the presser-bar, and when the lever B is raised the gripping-piece is released and allowed to resume its normal position, as set forth.

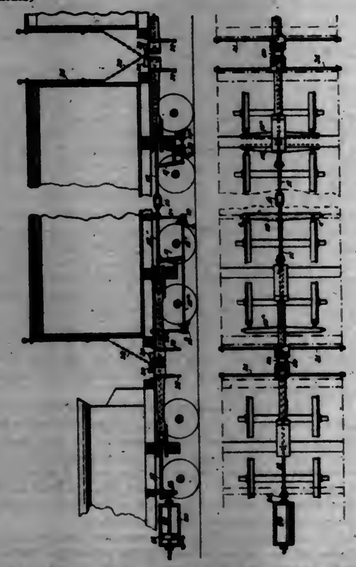
11. In a shoe-tying machine, the combination of the horn or work-support, knotting devices below the same, and the presser-foot having an orifice b^{17}, a portion of which constitutes a guide and lateral support for the needle, while another portion constitutes a guide between which and the needle the tying-cord passes, and a downwardly-projecting flange D^6 at one side of said orifice, whereby space is left for the cord under the cord-guiding portion of the orifice and between the presser-foot and the work-support, as set forth.



12. In a shoe-tying machine, the combination, with the knot-tying mechanism, of the oscillating blade Q, the presser-foot having the orifice b^{17} one side of which constitutes a blade b^{15}, and the recess or depression d^3, for the passage of the cord under the oscillating blade, as set forth.

13. In a shoe-tying machine, the combination of the presser-foot having a shear-blade formed on it, the oscillating shear-blade pivoted to said foot, the clamping-plate vertically movable in guides in the foot and bearing on the oscillating blade, and a spring whereby said plate is pressed against said blade, as set forth.

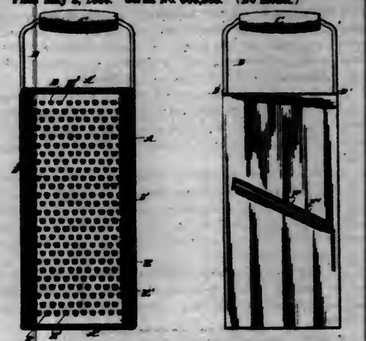
411,566. AUTOMATIC COCK OR CUT-OFF FOR GAS-BURNERS. CHARLES H. BARNEY, New York, N. Y. Filed Nov. 16, 1888. Serial No. 291,008. (No model.)



Claim.—1. The combination, with the burner having a horizontal

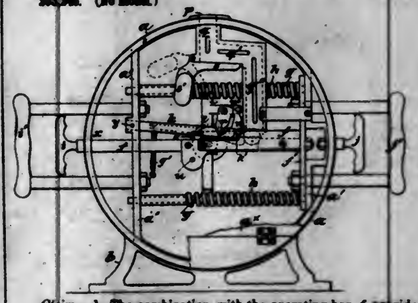
cock provided with a spring holding it closed and a vertically-extending finger-plate *b*, adapted to be turned to a horizontal position, of a vertically-extending pawl swinging inwardly over the finger-plate when the latter is turned down against the action of the spring, and the vertical circular compound plate secured at one end to the burner and having a point at its free end resting against the inner edge of the pawl, substantially as set forth.

2. The combination, with the burner having a horizontal cock B, provided with a closing-spring and a vertically-extending finger-plate *b*, of a support D, secured to the burner, and provided with a depending vertically-swinging pawl E, the lower part of which swings inwardly over the finger-plate when the latter is turned down into a horizontal position, a guide *f'* in line with the pawl and in rear thereof, and the vertical circular compound plate F, secured at one end under the guide and at its opposite end provided with a horizontally-extending separate point *f*, passing through the guide against the rear side of the pawl, substantially as set forth.



411,567. COMBINED CAR COUPLING AND BRAKE. JULIAN S. RAGSAW, Chipley, Fla. Filed May 9, 1889. Serial No. 310,168. (No model.)

Claim.—1. The combination, with draw-heads formed with recesses *a*, of rods provided with heads which normally rest within said recesses, connections between the rods of the two draw-heads, levers 17 and 17ᵇ, brake-heads to which said levers are connected, and brake-shoes carried by the brake-heads, substantially as described.



2. The combination, with draw-heads formed with recesses *a*, of rods provided with heads which normally rest within said recesses, connections between the rods of the two draw-heads, levers 17 and 17ᵇ, brake-heads to which said levers are connected, brake-shoes carried by the brake-heads, a steam-cylinder, a piston arranged therein, and connections, substantially as described, between the piston and the draw-head rods.

411,568. GRATER AND SLICER. ALBERT C. BUSKIRK, Manitowoc, Wis., assignor to the Lake Shore Manufacturing Company, same place. Filed May 2, 1889. Serial No. 309,202. (No model.)

Claim.—As a new article of manufacture, the combined grater and slicer, consisting of the curved front A, formed with the small rectangular slots E and the W-shaped projections E', the flat metal back D, formed with the inclined slot F and cutting-edge F', and the wire handle B, having the extended side pieces B', around which the side edges of the front A and back D are bent, substantially as set forth.

411,569. COIN-CONTROLLED GRIP-TESTER OR SIMILAR DEVICE. PETER BEHR, Brooklyn, N. Y. Filed Dec. 11, 1888. Serial No. 293,246. (No model.)

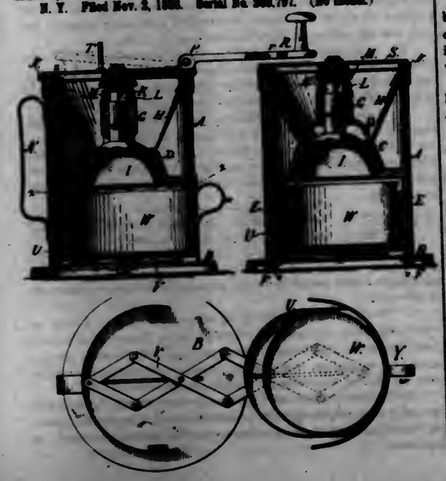
Claim.—1. The combination, with the operating-bar *f*, provided with a slot *e* and beveled shoulder f^x, of the longitudinally-sliding rack *e*, mounted on said bar and provided with a notch l^x in the upper edge of its plate, the pivoted latch *k*, arranged over the bar *f* and provided with a beveled end *k'*, and a stud *l*, which engages the notch in the rack, and the suspended detainer *n*, provided with an angular slot n^x, which is engaged by a stud *m* on said latch, all arranged and adapted to operate as set forth.

2. The combination, with the casing and dial, of the operating-bar *f*, the rack *e*, mounted thereon, the arbor e^x, the pinion *d* thereon gearing with said rack *e*, the pointer *t* on said arbor provided with a pin or stud *d'*, the tubular shaft *V* on said arbor, the brake-wheel *d'* and pointer *t'*, fixed on said tubular shaft, the volute spring *h'* about said shaft, the brake-lever *d'* and its spring, and the pendent forked lifter *v*, the fork in which is engaged by a stud *v* on the operating-bar *f*, all arranged and adapted to operate substantially as set forth.

3. The combination, with the casing *a*, provided with a coin-slit *p*, and the operating-bar *f*, provided with a slot *o* to receive the coin inserted at said slit, of the coin-chute consisting of the vertical or upright receiving branch *q*, communicating with the coin-slit, the upright delivery branch *q'*, arranged to stand normally over slot *o* in the bar *f*, the substantially horizontal branch *q'*, and the counter-weighted hinged bottom *o* of the branches *q* and *q'* of the chute, all arranged and adapted to operate as set forth.

411,570. TESTING DEVICE. HENRY F. RESELING, Philadelphia, Pa. Filed May 15, 1889. Serial No. 310,816. (No model.)

Claim.—1. A rotatable shaft, in combination with a transparent tube, and with a tube-carrier hinged or pivoted to the same and formed with a foot and a strap, said tube being removably sustained by said plate, foot, and strap, substantially as described.



2. A testing device for milk, &c., consisting of a frame or stand, a shaft mounted in said frame, means for rotating the shaft, a tube-carrier hinged or pivoted to said shaft, and a transparent tube removably fitted to said carrier, said parts being combined and operating substantially as described.

3. A testing device for milk, &c., consisting of a frame, a vertical shaft journaled therein, mechanism, substantially as described, mounted in said frame for rotating said shaft, a head at the upper end of said shaft having ears or lugs at or near its outer edge, carriers having ears at their upper ends pivotally connected to said head, and transparent tubes secured to said carriers, said parts being combined substantially as described.

4. In a testing device for milk, a rotary head with ears at or near its periphery, in combination with a carrier having a foot at its lower end and ears at its upper end, a transparent tube resting on said foot and secured to said carrier by the straps Q, the said ears of the head and carrier having a pivotal connection, substantially as described.

411,571. GRINDING-MILL. CHARLES A. BRISTOLE, New York, N. Y. Filed Nov. 2, 1888. Serial No. 289,797. (No model.)

Claim.—The combination, with the cylinder A, mounted upon a base-piece B and containing the grinding mechanism, of the receptacle-support secured to the base by hasp-hinge, substantially as shown and described.

411,572. OBSTETRICAL INSTRUMENT. CHARLES D. BOSS, Nevada City, Cal. Filed Jan. 3, 1889. Serial No. 295,726. (No model.)

Claim.—As a new article of manufacture, an obstetrical instrument consisting of the curved socket-piece A for the reception of the index-finger, having a jaw C at its closed end, and provided with a ring or loop B at its open end for the reception of the second finger, as set forth.

411,573. COMBINED CASH-INDICATOR AND COIN-COUNTER. GEORGE BOSENBAUM, Brooklyn, N. Y. Filed Dec. 17, 1888. Serial No. 293,943. (No model.)

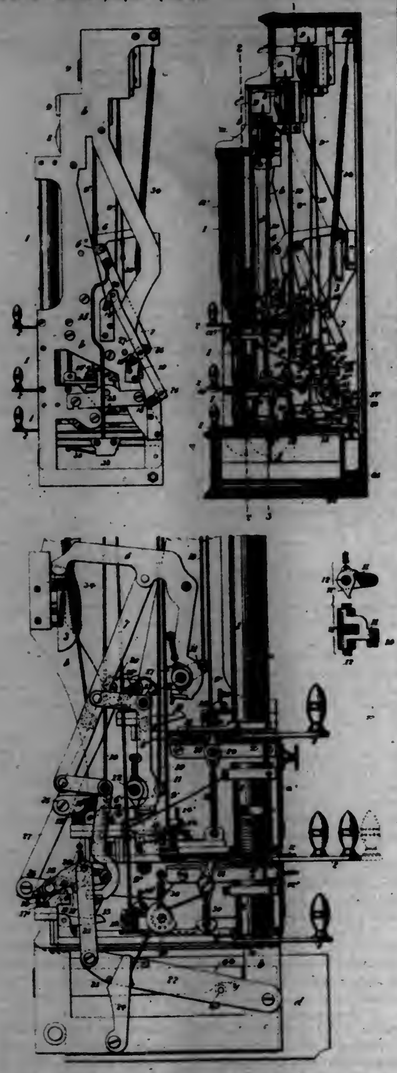
Claim.—1. In an apparatus for checking the receipt of money, the combination with a series of check-holders and a series of pulls 2 for removing the checks from same, of locking mechanism actuated by the operation of each pull, whereby when any pull is operated it locks all the other pulls of the series.

2. In an apparatus for checking the receipt of money, the combination, with a series of check-holders, a series of check-removing pulls 2, and a locking mechanism actuated by the operation of each pull, whereby when any pull is operated it locks all the other pulls of the series, of a gong or bell 3, its striking mechanism, and intermediate mechanism, substantially as described, whereby the operation of any pull in the series sounds the gong.

3. In an apparatus for checking the receipt of money, the combination, with a series of pulls 2 and a locking mechanism actuated by the operation of the several pulls, whereby the operation of each pull locks all the others, of a series of counters or registers, one for each pull, and an intermediate counter-actuating mechanism, whereby the operation of the pull actuates the counter.

4. In an apparatus for checking the receipt of money, the combination, with a series of check-holders and a series of pulls 2, one for each check-holder, of a series of numeral-bearing plates 9, one for each pull, and intermediate shifting mechanism, substantially as described, whereby the operation of a pull turns the side of the plate bearing the numeral into view and the operation of the next succeeding pull turns said numeral out of sight.

5. In an apparatus for checking the receipt of money, the combination, with a series of check-holders and a series of pulls 2, one to each check-holder, for removing the checks singly from their respective holders, of a cash-drawer and a locking device for said drawer, which is unlocked by the movement of any one of said pulls.



6. In an apparatus for checking the receipt of money, the combination, with a series of check-holders, of a series of pulls 2, one to each holder, for removing the checks singly from their respective holders, each of said pulls being provided with an automatic stop, which prevents the pull from being pushed back when only partly drawn out.

7. In an apparatus for checking the receipt of money, the combination, with a series of pulls 2, each provided with studs 18 and 19, of a rock-shaft 16, extending laterally over said pulls, said rock-shaft being provided with front pins 17 17, to engage studs 18 on the respective pulls, and with stop-pins 17' 17', to engage studs 19 on the respective pulls, substantially as and for the purposes set forth.

8. In an apparatus for checking the receipt of money, the combination, with a series of pulls 2, each provided with studs 18 and 19, of a rock-shaft 16, extending laterally over said pulls and provided with pins 17 and 17', arranged as described, the side lever 22, provided with a stud 23 and coupled to an arm on rock-shaft 16, and the spring-latch 24, provided with incline on its face, over which stud 23 plays, substantially as set forth.

9. In an apparatus for checking the receipt of money, the combination, with two tiers of pulls arranged one above the other, each pull being provided with studs 18 and 19, as described, of the rock-shafts 16 and 16^x, which extend over the upper and lower tiers of pulls, respectively, and are each provided with pins 17 and 17', arranged

as shown, the arms 23 on said rock-shafts, and the link 27, coupling said arms, whereby the rocking motion of one shaft is communicated to the other, for the purpose specified.

10. In an apparatus for checking the receipt of money, the combination, with a series of check-holders and a series of check-removing pulls 2, each provided with a shoulder 4, of the elbow-levers 6 6×, pivotally mounted on the frame, the swinging bar 5, secured at its ends to the pendent arms of said levers and extending over the pulls in the paths of the shoulders 4 thereon, the gong 3, and its hammer actuated by the arm of one of said elbow-levers, whereby the operation of either pull in the series sounds the gong.

11. In an apparatus for checking the receipt of money, the combination, with two tiers of pulls 2, arranged one above the other, each pull being provided with a shoulder 4, of the main elbow-levers 6 6×, the swinging bar 5, uniting same and extending over the upper tier of pulls, the elbow-levers 6' 6', the swinging bar 5', uniting same and extending over the other tier of pulls, the link 7, coupling together the said elbow-levers 6 and 6', the gong 3, and its hammer actuated by the arm of one of said elbow-levers, substantially as set forth.

12. In an apparatus for checking the receipt of money, the combination, with a series of pulls 2, each provided with a shoulder 13, of a series of counters or registers 8, their actuating-rods 10, a rod 12, extending across and over the pulls, the rocking arms 11 on said rod 12, one over each pull and coupled to one of said rods 10, and the spring-rockers 11×, also mounted on said rod 12 and actuated by the respective pulls, substantially as set forth.

13. In an apparatus for checking the receipt of money, the combination, with a series of pulls 2, each provided with a spring-hook pawl 15, of the numeral-bearing plates 9, their respective shafts 9×, one for each pull, and the arms 14, one on each shaft 9×, said arms extending out over the pull in the path of the hook-pawl thereon, substantially as set forth.

14. In an apparatus for checking the receipt of money, the combination, with a series of pulls 2, each provided with a hook-pawl 15 and a shoulder 4, of the numeral-bearing plates 9, their respective shafts 9×, one for each pull, the arms 14 on the respective shafts 9×, each arm standing over its pull and provided with a pin 14×, and the swinging bar 5 and its supports, said bar extending over the series of pulls and adapted to engage the pins 14× on arms 14, substantially as set forth.

15. In an apparatus for checking the receipt of money, the combination of a series of pulls 2, each provided with a shoulder, the swinging bar extending across over said pulls in the paths of said shoulders, elbow-levers in the arms of which said swinging bar is secured, a lever 32, pivoted to the main frame and coupled to one of said elbow-levers, whereby vibration of said swinging bar imparts vibration to said lever 32, the pawl 35 on said lever 32 and its spring, the pin 39 in said lever 32 and the cash-drawer provided with a rib 38, a shoulder 37, and a shoulder 40, all arranged to operate substantially as set forth.

16. In an apparatus for checking the receipt of money, the combination, with a series of pulls 2, each provided with studs 18 and 19, of the rock-shaft 16, provided with the pins 17 and 17', arranged as described with reference to the studs on the pulls, the arm 20 on the said rock-shaft, the side lever 22, provided with a stud 43, the link 21, connecting lever 22 with arm 20, and the cash-drawer *d*, provided at its end adjacent to lever 22 with a plate 44, under which stud 43 stands, said plate having a recess *y* in its lower edge, all substantially as and for the purpose set forth.

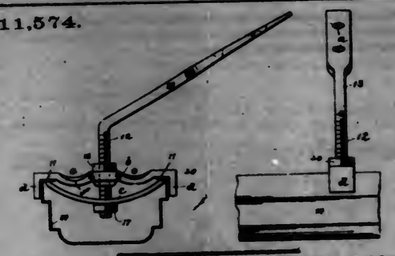
17. In an apparatus for checking the receipt of money, the combination, with the check-holders and the check-removing pull 2, provided with a series of projecting teeth 31, of a rocking spring-pawl 28, held normally with its axis at right angles to the plane in which the pull plays, said pawl being adapted to engage said teeth, as set forth.

18. In an apparatus for checking the receipt of money, the combination, with a series of pulls 2, of a cash-drawer, locking devices for said drawer, and intermediate mechanism between said locking devices and pulls, whereby the drawing out of a pull sets said devices and the pushing in of said pull unlocks the drawer, as set forth.

19. In an apparatus for checking the receipt of money, the combination, with a series of pulls 2, of the intermediate mechanism whereby the drawing out of one pull locks all the others, the gong, the intermediate mechanism whereby the pulls sound the gong, the counters or registers, and the intermediate mechanism whereby the pulls actuate said registers, substantially as set forth.

20. In an apparatus for checking the receipt of money, the combination, with a series of check-holders and a series of check-removing pulls 2, of the cash-drawer and the locking mechanism for said drawer, said locking mechanism being actuated by said pulls.

21. In an apparatus for checking the receipt of money, the combination, with a series of check-holders and a series of check-removing pulls 2, of the counters or registers, the intermediate mechanism whereby said pulls actuate said registers, the number-bearing plates, and the intermediate mechanism whereby the pulls actuate said plates, as set forth.



411,574. EAVES-TROUGH. CHARLES M. REED, Providence, R. I. Filed May 23, 1889. Serial No. 311,687. (No model.)

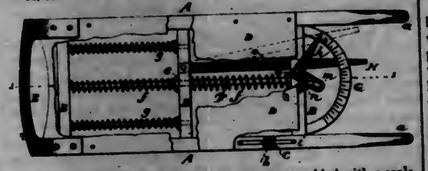
Claim.—1. The combination, with a gutter or eaves-trough having inwardly-extending flanges, of a sectional clamp adapted to receive the flanges of the gutter or trough between its sections, substantially as described.

2. The combination, with a gutter or eaves-trough having inwardly-extending flanges, of a sectional clamp formed of the apertured sections *b c*, the section *b* being provided with the downwardly-extending projections *d*, the shank 13, provided with the threaded stem 12, and the nuts 16 and 17, substantially as described.

3. The combination, with a gutter or eaves-trough formed with inwardly-extending flanges, of a sectional clamp, a means for adjusting the clamp-sections, and a clamp-supporting shank, substantially as described.

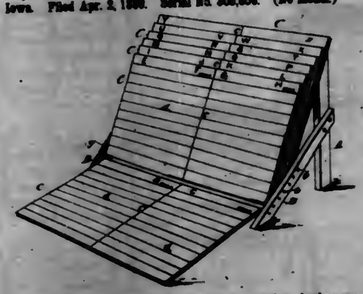
411,574.

411,575. CHAIN. WILLIAM H. REED, Brooklyn, N. Y. Filed Sept. 18, 1888. Serial No. 285,601. (No model.)



Claim.—1. A chain formed of flat links riveted together and having lateral studs projecting from the outer faces thereof intermediate the riveted ends, substantially as described.

2. As a new article of manufacture, a chain formed of flat links riveted together, the outer links being provided with laterally-projecting studs between their riveted ends, substantially as described.



3. As a new article of manufacture, a flat chain-link apertured at each end for receiving rivets, and having a rigid stud projecting from one of its flat faces intermediate said apertures, the opposite flat face being plain, substantially as described.

411,576. WEEDING HAND-TRUCK. JOSEPH H. BROWN, Farwell, Mich., assignor of one-half to Frank E. Presley, same place. Filed May 11, 1889. Serial No. 310,444. (No model.)

Claim.—The combination, with the frame provided with a scale-bar and indicator, a rod F, springs *f g*, and a series of rollers *c*, of a movable platform provided with tracks *d*, lugs *e*, and catch *p*, and a lever H in position to connect with catch *p*, substantially as set forth and described.

411,577. LEDGER-INDEX DEVICE. KENT ROLAND, Linn Grove, Iowa. Filed Apr. 2, 1889. Serial No. 305,656. (No model.)

Claim.—1. The within-described ledger-index device, consisting of a series of double-faced tablets pivoted one below the other upon the sloping front of an upright frame and alphabetically marked in the corners of their opposite spaced surfaces, said tablets being also provided with ledger-page spaces to correspond with said alphabetical marks, substantially as specified.

2. The combination, with the back portion A of the frame and inclined front portion B thereof, of the double-faced tablets C, pivoted at their lower ends, one below the other, to the inclined portion B of the frame, said tablets being intermediately divided on their opposite faces or surfaces transversely of the axial lines of their pivots into separate entry-spaces, and said spaces being differently alphabetically lettered in the upper corners of the opposite sides of the tablets, respectively, substantially as shown and described.

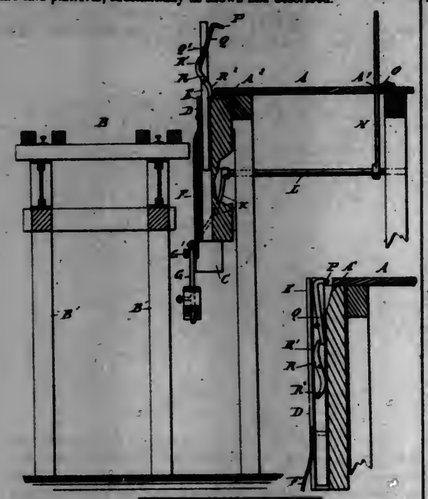
411,578. END-GATE. THOMAS J. REES, Marion, Iowa. Filed July 6, 1889. Serial No. 316,502. (No model.)

Claim.—1. In an end-gate, the combination, with a vehicle-body having a hook secured to each side thereof at the lower rear corner and extending downwardly and forwardly therefrom, of an end-gate provided with plates attached to the opposite lower corners, having a slot produced therein, and a cylindrical leg or rib crossing the said slot transversely, adapted for contact with the said hook, substantially as and for the purpose specified.

2. In an end-gate, the combination, with a vehicle-body and a hook secured to each side at the lower rear corner, projecting downwardly and rearwardly therefrom, of an end-gate provided with a plate secured to the outer face thereof at each lower corner and provided with a slot or opening near the lower end, a cylindrical rib or leg extending transversely across the said opening, adapted for contact with the hook, and a guide-arm integral with the outer face of the plate parallel with one vertical wall of the opening therein and projecting downward below the said plate, all combined for operation substantially as shown and described.

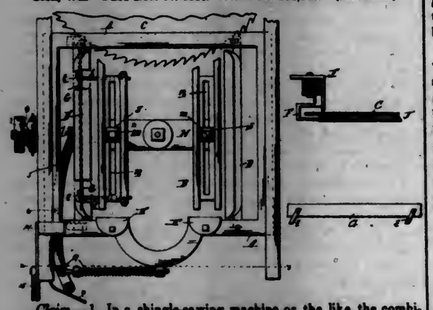
3. In an end-gate, the combination, with a casting or forging comprising the arms 15 and 16 and the hook-section 19, of a plate adapted for attachment to the end-gate, provided with an opening, a cylindrical leg or rib extending transversely across the said opening and adapted for contact with the hook, and a guide-arm secured to the said plate adjacent to the said opening, substantially as and for the purpose specified.

4. In an end-gate, the combination, with a forging or casting comprising the arms 15 and 16 and hook-section 19, of a plate adapted for attachment to the end-gate, provided with a vertical slot or opening in the lower edge, a lug or rib formed upon one face of the plate, extending transversely across the lower portion of the said opening and adapted to contact with the hook, and a vertical guide-arm secured to the plate adjacent to and parallel with the outer wall of the opening, substantially as and for the purpose specified.



411,579. RAILROAD-GATE. JOHN B. CAREY, Brooklyn, N. Y. Filed Nov. 21, 1888. Serial No. 291,462. (No model.)

Claim.—1. In a railroad-gate, the combination, with self-closing railroad-gates mounted to slide in guides arranged below the station-platform, of a lever extending above the platform and serving to open the gates flush with the platform, and a frame mounted to swing automatically on the front of each gate and serving as a danger-signal, substantially as shown and described.



2. In a railroad-gate, the combination, with a platform and guides held below the said platform, of a gate held to slide in the said guides, a weighted lever connected at one end with the said gates, a rod connecting the several levers with each other, a hand-lever extending above the platform and connected with the said rod to open the gates, and a frame mounted to swing automatically at the upper end of each gate and in front of the same and serving as a danger-signal, substantially as shown and described.

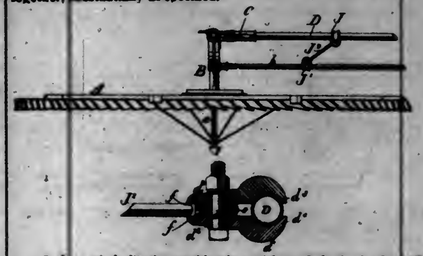
3. In a railroad-gate, the combination, with a platform and guides held below the said platform, of a self-closing gate held to slide in the said guides, a lever extending above the platform and serving to open said gate, a frame held in the front of said gate, a lever pivoted at

each end of the said gate and carrying said frame; and S-shaped levers controlling the said frame-levers and operated by an incline on the said platform, substantially as shown and described.

411,580. SHINGLE-SAWING MACHINE. JOHN CHALLONER, Oshkosh, Wis. Filed Nov. 17, 1888. Serial No. 291,178. (No model.)

Claim.—1. In a shingle-sawing machine or the like, the combination of a guard attached on the side toward which the saw runs, with the tilting table capable of being adjusted to the saw, and push-bars attached to the carriage so as to extend around and under the saw when the carriage is forward, substantially as and for the purpose set forth.

2. In a shingle-sawing machine or the like, the combination of an adjustable tilting table supporting a guard on the side toward which the saw runs, with push-bars attached to the carriage so as to pass around and under the saw when the machine is in motion, substantially as and for the purpose described.



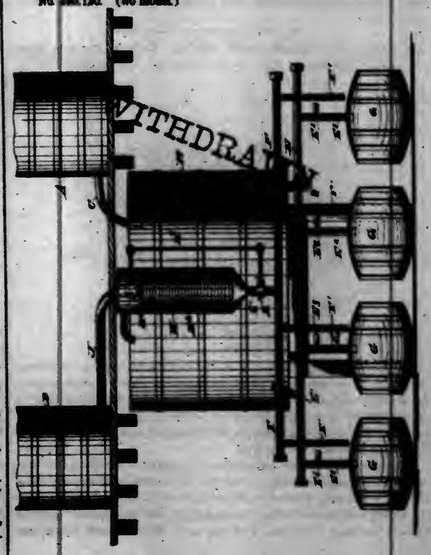
3. In a shingle-sawing machine or the like, push-bars attached to the carriage and sliding in grooves or recesses in the table, and being bent forward so as to reach around and under the saw when the carriage is forward, substantially as shown and described.

4. In a shingle-sawing machine or the like, the table provided with sides adjustable to and from the saw, said sides being attached to the cross-bar H by means of the set-screws *n n*, sliding in the grooves or recesses *o o* and bearing against washers *r r*, to engage the sides, and a guard G, secured to one of the adjustable sides, substantially as and for the purpose set forth.

5. In a shingle-sawing machine, a guard attached beneath the dog on the side of the machine toward which the saw runs, said guard being vertically adjustable, so that its upper edge may be always kept above the upper side of the saw.

411,581. WINDMILL. ANDREW J. CHRISMAN, Jersey City, N. J. Filed Nov. 15, 1888. Serial No. 290,877. (No model.)

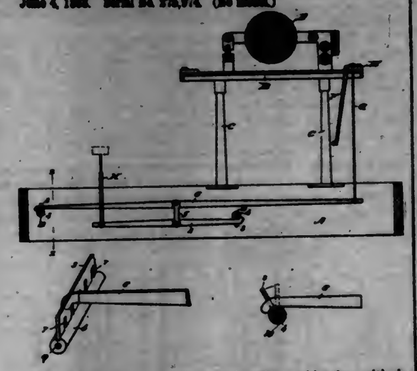
Claim.—1. In a windmill, the combination, with the wind-wheel, of a tail-vane bar so supported as to be movable into a position approximately parallel with the wind-wheel, a side-vane bar, and a rigid detachable lock for securing the tail-vane bar and the side-vane bar together, substantially as specified.



2. In a windmill, the combination, with a wind-wheel, of a tail-vane bar so supported as to be movable into a position approximately parallel with the wind-wheel, a side-vane bar also approximately parallel with the wind-wheel, and a lock for securing said bars together, consisting of two clamps and a connecting bar or rod between the clamps, substantially as specified.

3. A lock for securing together the tail-vane bar and the side-vane bar of a windmill, consisting of two clamps adapted to grip said bars, a connecting-rod extending between said clamps, and bolts by which not only are the clamps caused to grip the bars, but also by which the clamps are caused to grip the connecting-rod, substantially as specified.

4. A lock for securing together a tail-vane bar and a side-vane bar of a windmill, consisting of jaws adapted to grip said bars, and provided with shank portions, bosses, or hubs upon the inner sides of said shanks, a connecting-rod provided with loops near its ends through which said bosses or hubs extend when the shanks are brought together, and bolts extending through said bosses or hubs and adapted to secure the connecting-rod and to cause the clamps to grip the said bars, substantially as specified.



5. In a lock for securing together the tail-vane bar and the side-vane bar of a windmill, the combination of gripper-jaws provided with shanks, hubs, or bosses upon the inner sides of said shanks, a connecting-rod provided with loops near its ends receiving said hubs or bosses when the shanks are brought together, said hubs or bosses being provided with apertures eccentric to their axes and in the portions thereof nearer said jaws, and bolts passing through said apertures for securing the jaws about said bars and causing the shanks to grip the loops of the connecting-rod, substantially as specified.

411,582. APPARATUS FOR SUPPLYING ALE-CASKS WITH ULLAGE. IRA COX, New York, N. Y. Filed Jan. 2, 1889. Serial No. 295,130. (No model.)

Claim.—The combination, with the tank A, the vat B, the horizontal pipe E, and connections between the said vat and the tank A and pipe E, of the tank D, the horizontal pipe F, the gage H, and valved connections between the gage and the tank D and pipe F, substantially as shown and described.

411,583. TYPE-WRITING MACHINE. HENRY R. CURTIS, Springfield, Mass., assignor to the Yost Writing Machine Company. Filed June 4, 1888. Serial No. 276,074. (No model.)

Claim.—1. In a type-writing machine, the combination, with the key-levers, of a plate adapted to be turned to two positions, one to permit the assembling or disassembling of the key-levers and the other to lock or confine said levers in position against accidental displacement during transportation or use of the machine, substantially as set forth.

2. In a type-writing machine, the combination, with the key-levers, of a plate provided with openings for the reception of the ends of the key-levers and adapted to be turned into a position to effect the locking or securement of said levers against endwise displacement.

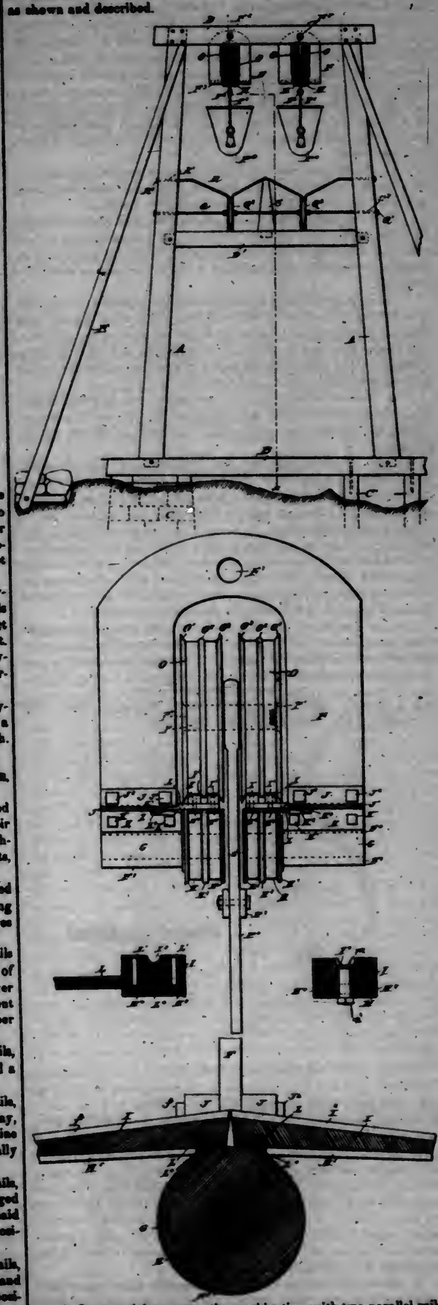
3. In a type-writing machine, the combination, with the key-levers, of a transverse fulcrum rod or support and a slotted or perforated vibratory locking-plate, substantially as set forth.

4. In a type-writing machine, the combination, with the key-levers, of a transverse fulcrum rod or support adapted to turn and a slotted or perforated vibratory locking-plate, substantially as set forth.

411,584. AERIAL TRAMWAY. ALFRED H. DE CAMP, Boonton, N. J. Filed Sept. 6, 1888. Serial No. 284,667. (No model.)

Claim.—1. In a suspended railway, the herein-described suspended track formed of continuous rails less in vertical section than in their other dimensions, the said rails being supported at intervals throughout the track, whereby they are allowed to flex between said supports, substantially as set forth.

2. The combination, in an elevated tramway, with the grooved supporting-rollers, of the track formed of continuous parallel oblong bars resting at intervals between their terminals flatwise in the grooves of the said rollers to slide therein, substantially as set forth.



3. In an aerial tramway, the combination, with two parallel rails supported loosely at intervals throughout the length of the track, of parallel cross-bars extending across the upper side of the track over the supports and oppositely-placed inclines supported at their adjacent larger ends on said cross-bars and extending freely along the upper sides of the tracks, substantially as set forth.

4. In an aerial tramway, the combination, with two parallel rails, of a cross-bar keeper for said rails, a keeper for said cross-bar, and a spring to elevate said cross-bar.

5. In an aerial tramway, the combination, with two parallel rails, of a flanged way for said rails, means of supporting the flanged way, substantially as described, a keeper-bar for said rails, and an incline attached to said keeper-bar and mounted above the rails, substantially as shown and described.

6. In an aerial tramway, the combination, with two parallel rails, of a flanged way for said rails, a means of support for said flanged way, a keeper-bar for said rails, and a grooved incline secured to said keeper-bar, said keeper-bar being supported and maintained in position, substantially as shown and described.

7. In an aerial tramway, the combination, with two parallel rails, of a flanged way for said rails, a means of support for said way, and a keeper-bar for said rails, means of securing said keeper-bar in position, as described, and a grooved incline attached to said keeper-bar, as described, and mounted above the rails and extending downward between the rails to hold said incline in a given relation to the rails, as shown and described.

8. In an aerial tramway, the combination, with two parallel rails, of a flanged way for said rails, means of support for said flanged way,

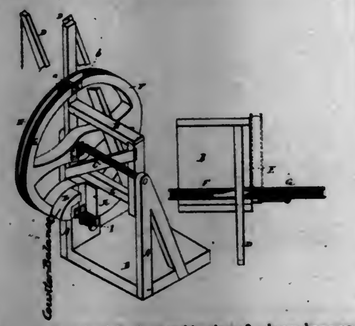
a keeper-bar for said rails, a grooved incline mounted above the rails and attached to said keeper-bar, and the plate M under the rails connected to the incline above the rails, as and for the purpose described.

9. In an aerial tramway, the combination, with two parallel rails, of an incline mounted above the rails and the bolts *m*, passing down between the rails connecting the incline and the plate M, and nearly filling the space between the rails, as and for the purpose described.

10. In an aerial tramway, the combination, with two parallel rails, of a keeper-bar for said rails, a yoke, and attachments thereto for maintaining said keeper-bar in proper relation to said rails, as shown and described.

11. In an aerial tramway, the combination, with two parallel rails, of a keeper-bar for said rails, a yoke on which said keeper is mounted, and a spring to elevate said bar, as shown and described.

12. In an aerial tramway, the combination, with two parallel rails, of a keeper-bar for said rails, a yoke, said keeper secured to said yoke and elevated, as described, and a lug upon said keeper-bar extending downwardly and interposed between the rails, as shown and described.



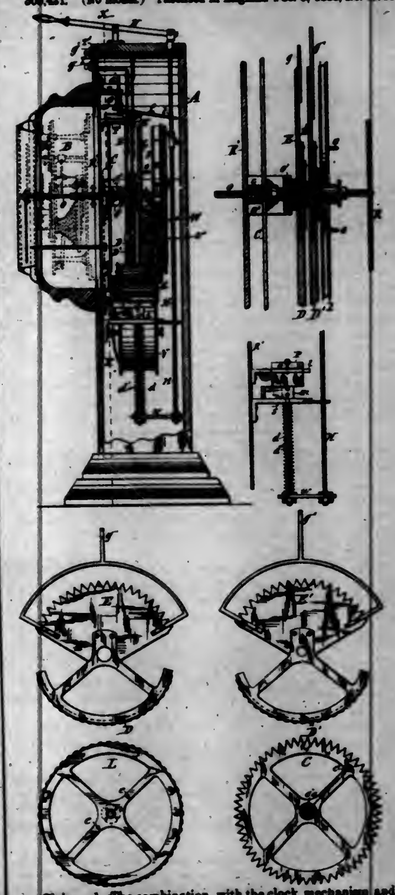
13. In an aerial tramway, the combination, with two parallel rails, of a flanged way on which said rails rest, a keeper-bar for said rails, secured substantially as described, a double grooved incline secured to two keeper-bars and mounted above the rails, a flanged traveling wheel provided with a hanger-arm, and a carrier suspended by said arm, substantially as shown and described.

14. In an aerial tramway, the combination, with two parallel rails, of a grooved double incline mounted above the rails and two flanged wheels, and two hanger-arms rigidly connected, as shown and described.

15. In an aerial tramway, the combination of two compound rails formed each of two or more parallel rails supported and kept by each arm of a yoke, each arm having attached to it, as described, an axle having a flanged way for each compound rail, and having proper keepers and springs for keeper-bars, two keeper-bars for each arm, a grooved incline attached to each keeper-bar, all members constructed substantially as shown and described, and a wheel on each side of each hanger-arm, flanged as required and turning upon the connecting-shaft, the hanger-arms also boxed to shaft, permitting shaft to turn, if required, substantially as shown and described.

16. In an aerial tramway, a carrier and means for supporting the same, in combination with a cable for moving the carrier and a pulley and guide-rod R for supporting and maintaining said cable in a particular line, substantially as shown and described.

411,585. DERRICK. Levi S. Dennis, Middletown, Conn. Filed July 15, 1889. Serial No. 317,909. (No model.)



Claim.—1. In a derrick, the combination of a beam hung upon a horizontal axis and so as to swing in a vertical plane in raising the load, a grooved wheel arranged in a plane parallel with the path of the swinging movement of the beam, the axis of the said wheel being substantially the axis of the beam, and the wheel in connection with the beam, so that rotation of the wheel will impart corresponding vertical swinging movement to the beam, a revolving drum, the axis of which is substantially parallel with the axis upon which the said grooved wheel rotates, with a cord upon said wheel and coiled upon said drum, whereby the rotation of the said drum imparts rotation to the said wheel in either direction, accordingly as the drum is turned, and the said rotation of the wheel imparts the vertical swinging movement to the lever, substantially as described.

2. The combination of a beam hung upon an axis, a wheel upon said axis and so as to rotate with the beam, the load end of the beam projecting from the wheel at one side, a counterbalancing-weight applied to the wheel upon the side opposite the load, and a cord upon said wheel by which rotation may be imparted to said wheel in either direction, substantially as described.

3. The combination of a beam hung upon an axis, a diametrically-divided wheel arranged to rotate upon the same axis as the beam, one part of the wheel made fast to the beam and the other part of the wheel hinged to the said fast part of the wheel, and so that said hinged part of the wheel may fold into a plane substantially parallel with the axis on which the beam swings, and a cord around said wheel and by which rotation may be imparted thereto, substantially as described.

4. The combination of a beam hung upon an axis, the beam oblique to the axis, a wheel attached to the beam, and so as to rotate upon the same axis, the power end of the beam projecting beyond the plane of the wheel, and so that the load carried by the beam may swing across the plane of the axis upon which the beam turns, and a cord around said wheel by which rotation may be imparted to it and the swinging movement to the beam, substantially as described.

411,586. WORKMAN'S TIME-RECORDER. Alexander Dey, Glasgow, County of Lanark, Scotland. Filed May 3, 1889. Serial No. 309,421. (No model.) Patented in England Feb. 3, 1888, No. 1,614.

Claim.—1. The combination, with the clock mechanism and minute-hand spindle, of a time-printing type-wheel arranged rotary with said spindle, recording type-wheels arranged concentric with the time-printing type-wheel and rotary independently thereof, indicators on the recording type-wheels, a plunger movable at will of the operator, a platen connected to the plunger and facing the respective type-wheels, and an impression-receiving band passing between the type-wheels and platen, as set forth.

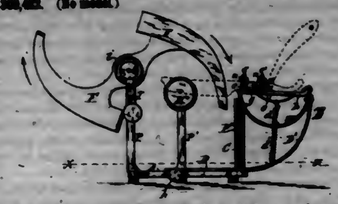
2. The combination, with the clock mechanism and minute-hand spindle, of a time-printing type-wheel arranged rotary with said spindle, recording type-wheels arranged concentric with the time-printing type-wheel and rotary independently thereof, indicators on the recording type-wheels, a detent actuated by the plunger and adapted to engage the recording type-wheel, a platen carried on the plunger and facing the respective type-wheels, and an impression-receiving band passing between the type-wheels and platen, substantially as set forth.

3. The combination, with the clock mechanism and minute-hand spindle, of a time-printing type-wheel arranged rotary with said spindle, recording type-wheels arranged concentrically with the time-printing type-wheel and rotary independently thereof, indicators on the recording type-wheels, segmental racks having V-shaped notches and rigidly attached to and concentric with the latter type-wheels, a plunger movable at will of the operator, a V-shaped detent actuated by the plunger and adapted to engage the notches of the aforesaid racks, a platen carried on the plunger and facing the respective type-wheels, and an impression-receiving band passing between the type-wheels and platen, substantially as set forth and shown.

4. In combination with the clock mechanism and minute-hand spindle, a wheel mounted loosely on said spindle and provided with V-shaped notches in its periphery, a spring connecting said wheel to the spindle, a type-wheel fixed to the hub of the aforesaid wheel, a V-shaped detent adapted to engage the notched wheel, a plunger movable at will of the operator and actuating the detent, a platen carried on the plunger and facing the type-wheel, and an impression-receiving band passing between the type-wheel and platen, substantially as described and shown.

5. In combination with the clock mechanism and minute-hand spindle, a driving-wheel independent of the clock mechanism, an hour-wheel receiving motion from said driving-wheel, and an escapement mechanism receiving motion from the minute-hand spindle and controlling the movement of the said hour-wheel, as set forth.

6. In combination with the clock mechanism and minute-hand spindle, a driving-wheel independent of the clock mechanism, an hour-wheel receiving motion from said driving-wheel, an escapement mechanism receiving motion from the minute hand spindle and controlling the movement of the hour-wheel, a type-wheel fastened to the side of the hour-wheel, a platen movable toward and from the said type-wheel, and an impression-receiving band passing between said platen and type-wheel, substantially as described and shown.



7. In combination with the clock mechanism and minute-hand spindle, a wheel mounted on and rotating with the said spindle, a driving-wheel independent of the clock mechanism, an hour-wheel receiving motion from said driving-wheel and provided with an annular row of teeth, detents normally in the path of said teeth, and projections on the aforesaid wheel of the minute-hand spindle disposed in such positions that each of said projections encounters one of the aforesaid detents and throws the same out of the path of the teeth of the hour-wheel, a type-wheel attached to the side of the hour-wheel, a platen movable toward and from the said type-wheel, and an impression-receiving band passing between the platen and type-wheel, substantially as described and shown.

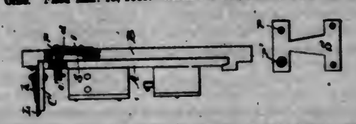
8. In combination with the case A, clock mechanism, and minute-hand spindle, the wheel C, provided with V-shaped notches in its periphery and provided also with the sleeve C', mounted loosely on said spindle, the spring *c*, secured at opposite ends, respectively, to the spindle and to the wheel C, the tabular hub O', secured to the frame, the type-wheels D D', mounted loosely on the said hub, the segmental racks E E', rigidly attached to said type-wheels and having V-shaped notches, the detent F, arranged movably toward and from the aforesaid V-shaped notches, the spring *a*, forcing the detent toward said notches, the type-wheel L, secured to and rotating with the sleeve C', the driving-wheel W, independent of the clock mechanism, the hour-wheel G, receiving motion from said driving-wheel and provided with teeth *d' d'*, the detents I I', normally in the path of said teeth, cams *b b*, affixed to the latter detents, projections *e e* on the type-wheel L, and each traversing one of the aforesaid cams, the type-wheel *i*, attached to the side of the hour-wheel G, the platen P, facing the respective type-wheels, the plunger H, connected with the platen, the spring *d*, forcing the platen from the type-wheels, the lever *f*, pivoted intermediate of its length and connected at opposite ends, respectively, with the detent F and plunger H, the lever N, pivoted on the case and connected with the aforesaid plunger, the index-plates T T', secured to the exterior of the case, and indicators *g g'*, attached, respectively, to the type-wheels D D', all combined to operate substantially as set forth.

9. In combination with the type-wheels D, D', and L, platen P, and plunger H, connected with said platen, the bridge R, lever S, pivoted to said bridge, inking-roller U, pivoted to said lever, and the arm A, attached to the plunger and coupled to the lever S, substantially as described and shown.

10. In combination with the type-wheels D, D', and L, and platen P, arranged movably toward and from said type-wheels, the spool V, feed-rolls K K', ratchet J, attached to one of said rolls, the lever *j*, connected at one end with the platen, the pawl *k*, connected to the opposite end of the lever, the dog *k'*, engaging the ratchet, and the band O, passing from the spool between feed-rolls, substantially as described and shown.

411,587. RAZOR-SHARPENING MACHINE. Alexander Dey, Glasgow, County of Lanark, Scotland. Filed May 3, 1889. Serial No. 309,422. (No model.)

Claim.—1. In combination with the main frame and rotary strop-carriers, a razor-holder-supporting bracket pivoted to the main frame axially parallel with the plane of the strop-carriers, and a stay holding said bracket and connected to the main frame adjustable laterally in relation to the razor-holder, as set forth.



2. In combination with the main frame and strop-carriers pivoted to said frame rotatably in a vertical plane, a post rising from the said frame, a bracket pivoted to said post and oscillatory in a horizontal plane, a screw working in the frame horizontally and at right angles to the plane of oscillation of the bracket and holding the said bracket in its position, and a razor-holder mounted on said bracket, as set forth.

3. In combination with the main frame and strop-carriers pivoted to said frame rotatably in a vertical plane and a razor-holder arranged on the frame in a line parallel with the plane of the strop-carrier, a crank attached to the strop-carriers at one side thereof, a post rising from the frame at the opposite side of the strop-carriers, and a handle attached to said post, substantially as described and shown.

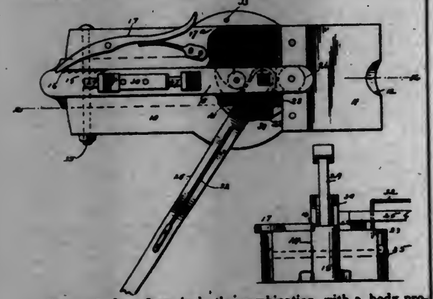
4. In combination with the main frame and rotatable strop-carriers, a bracket on said frame provided with two posts standing in line with the plane of the strop-carriers, a yoke pivoted to said posts, a razor-supporting bar pivoted to the yoke axially parallel therewith, springs sustaining said yoke and bar in their normal position, abutments on one side of said bar formed with screw-posts, clamping-nuts on the latter posts bearing on top of the razor-shank, a post rising from the opposite side of said bar, and a set-screw passing horizontally through the post and binding the razor-shank between the said screw and aforesaid abutments, substantially as described and shown.

5. The improved razor-sharpening machine, consisting of the frame A, formed with the lateral base-extension A' and posts P, P', and P'', the strop-carriers F F, pivoted to the side of the post P and provided with the crank I, the handle H, attached to the post P', the bracket B, formed with the vertical sleeve C, pivoted to the post P', the bracket B, formed with the vertical sleeve pivoted to the post P'' and with the horizontal base-extension D and upwardly-curved post or arm D', the yoke *a*, pivoted to the post D' and sleeve C, the bar *b*, pivoted at opposite ends to the ends of said yoke and provided with the downwardly-projecting brace *c*, the spring *d*, connecting the lower portion of the yoke to the base of the bracket B, the spring *d'*, connecting the brace *c* with the said portion of the yoke, abutments *e e* on one side of the bar *b*, formed with screw-threaded posts *f f'*, nuts *n n* on said posts, the post *f* on the opposite side of the bar, the set-screw *g*, passing horizontally through said post, and the set-screw *h*, working horizontally in the frame A and at right angles to the base-extension D of the bracket and provided with a circumferential groove in its head and engaging thereby the extremity of the aforesaid base-extension, substantially as described and shown, for the purpose set forth.

411,588. TELEPHONE-HOLDER. Charles T. Dickens, Cincinnati Ohio. Filed Mar. 15, 1889. Serial No. 303,427. (No model.)

Claim.—1. In a telephone-holder composed of two separable parts, the combination of a stationary frame B, to which the circuit-wires are attached, a removable frame A, carrying the telephone-instruments, and a switch connecting the ends of the circuit-wires and

normally completing the circuit on the stationary frame, arranged to be displaced, so that connection may be broken through the switch and made through the telephone by the action of a co-operating part on the removable frame when the two parts of the holder are joined, substantially in the manner and for the purpose described.



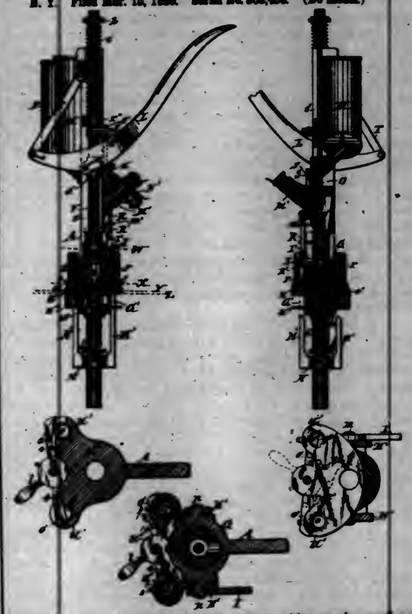
2. In a telephone-holder of two parts, the combination of the stationary frame B, holding the line-wires, a removable frame A, carrying the telephone-instruments, and a spring-switch on said stationary frame normally pressing against and connecting the ends of the circuit-wires, arranged to be pressed aside and automatically to break the circuit by contact with a co-operating member of said switch on the removable frame when the two parts of the frame are connected and automatically to close the circuit when the parts are separated, substantially as and for the purpose described.

3. In a telephone-holder of two parts, the stationary frame provided with a series of connection-pins, to which the line-wires are attached, said pins having enlarged heads, in combination with metallic spring-switches pressing against the under surface of the pin-heads and arranged to be displaced by the portable frame on the joining of the two parts, substantially as shown and described.

4. In a telephone-holder of two parts, the stationary frame B, in combination with the pins *p p'*, having enlarged heads, the double-armed spring S, portable frame A, and pin *k*, arranged in the manner and for the purpose described.

5. In a telephone-holder of two parts, the combination of the pins *p p'* with the heads *r r'*, spring S, screws *d d'*, and pin *k*, arranged substantially as and for the purpose described.

411,589. FLOOR-JACK. JOSEPH DIX, Abbotsford, Wis. Filed Aug. 9, 1888. Serial No. 282,249. (No model.)



Claim.—1. In a floor-jack, the combination, with a body provided with a nose at its forward end having a transverse groove, a central longitudinal essentially T-shaped slot, and a cam-rabbet produced in its upper face contiguous to the nose and intersecting the said slot, of an essentially T-shaped jack-bar having notches in one side and provided with a recess at its forward end, an essentially hook-shaped dog pivoted in the jack-bar engaging the walls of the cam-rabbet, a transversely-slotted shoe secured to the said dog, and a handle also pivoted to the jack-bar vibrating in the recess of the shoe, detachable spikes passing through the said jack-bar, and a spring-actuated pawl engaging the notches of the bar, substantially as shown and described.

2. In a floor-jack, the combination, with a body having a nose integral with its forward end grooved transversely and provided with a recess in its upper face contiguous to the groove, a cam-recess formed in the upper face of the said body contiguous to the nose, an essentially T-shaped jack-bar reciprocating longitudinally in said body, provided with notches in one face near its rear end and a recess in its forward end, and a spring-actuated pawl engaging the notches of the jack-bar, of an essentially hook-shaped dog pivoted in the forward end of the jack-bar engaging the forward walls of the cam-rabbet, a transversely-recessed shoe secured to the said dog, a handle vibrating in the recess of the said shoe, a friction-roller engaging the hub of the dog and shoe, and a second friction-roller engaging the outer cylindrical surface of the said dog, spikes loosely projected through the jack-bar, and a spring engaging the contiguous surfaces of the spikes, substantially as shown and described.

3. In a floor-jack, the combination, with a body provided with a cam-rabbet in its upper face and a nose contiguous to the said cam-rabbet, provided with a transverse groove and an inclined central recess in its upper face contiguous to the groove, of an essentially T-shaped jack-bar sliding longitudinally in the body, having a recess in its forward end, an essentially hook-shaped dog pivoted to the jack-bar engaging the forward walls of the said rabbet, a shoe having a transverse recess fixed to the upper face of the dog, a handle also pivoted to the jack-bar vibrating in the recess of the shoe, friction-rollers engaging the front and rear of the said dog, spikes passing through the jack-bar at an inclination toward the rear, a spring engaging the contiguous faces of the spikes, and a pawl pivoted to the upper face of the body engaging one face of the jack-bar at or near its rear end, all combined to operate substantially in the manner and for the purpose specified.

411,590. CARTRIDGE-LOADER. EDWARD G. DOSCHEMITZ, Geneva, N. Y. Filed Mar. 15, 1889. Serial No. 303,426. (No model.)

Claim.—1. In combination with the cartridge-receiver and powder-channel over the same, ball-reservoirs at opposite sides of said channel and a ball-transferrer arranged movably laterally between the cartridge-receiver and the aforesaid channel and reservoirs and provided with passages adapted to communicate alternately with the said parts, as set forth.

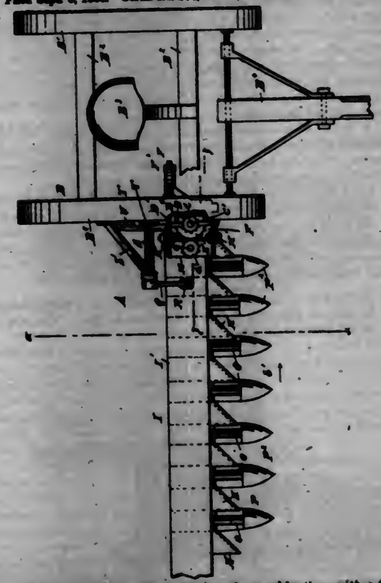
2. In combination with the cartridge-receiver, a powder-channel above and in range with said receiver, ball-reservoirs disposed at opposite sides of and equidistant from the powder-channel, and a ball-transferrer arranged movably laterally between said receiver and reservoirs and provided with vertical passages arranged apart at a distance equal to that between the axis of the cartridge-receiver and one of the aforesaid reservoirs, substantially as set forth and shown.

3. In combination with the cartridge-receiver, a powder-channel above and in range with said receiver, ball-reservoirs disposed at opposite sides of and equidistant from the powder-channel, a ball-transferrer arranged movably laterally between said receiver and reservoirs and provided with vertical passages arranged apart a distance equal to that between the axis of the cartridge-receiver and one of the ball-reservoirs, and a gate arranged movably across the bases of the ball-reservoirs, as set forth and shown.

4. In combination with the cartridge-receiver, ball-reservoirs above said receiver and disposed at opposite sides of and equidistant from the axial line thereof, a ball-transferrer arranged movably laterally between said receiver and reservoirs, a gate arranged movably across the bases of the reservoirs, and lugs on the transferrer engaging the gate to move the same automatically, as set forth.

5. In combination with the cartridge-receiver, ball-reservoirs above said receiver and disposed at opposite sides of and equidistant from the axial line of the receiver, a ball-transferrer arranged movably laterally between said receiver and reservoirs, a gate arranged movably across the bases of the reservoirs, gages arranged movably across the said reservoirs above the gate, and arms on the gate actuating the gages.

6. In combination with the cartridge-receiver, ball-reservoirs above said receiver and disposed at opposite sides of and equidistant from the axial line of the receiver, a ball-transferrer arranged movably laterally between said receiver and reservoirs, a gate arranged movably across the bases of the reservoirs, gages arranged movably across the said reservoirs above the gate, arms on the gate actuating the gages, a spring engaging the gate, and lugs on the ball-transferrer engaging the gate, substantially as described and shown.



7. The combination of the ball-reservoir provided with a longitudinal slot, a gate across the base of said reservoir, a spring attached to the exterior of the reservoir adjustably longitudinally thereon, a gage attached to said spring and projecting through the aforesaid slot, and an arm attached to the gate and engaging the spring, substantially as described and shown.

8. In combination with the cartridge-receiver, a powder-and-ball transferrer pivoted to the front of the top of the said receiver and provided with two vertical passages equidistant from its pivot, two ball-reservoirs arranged over the transferrer at opposite sides of the axial line of the cartridge-receiver and equidistant from the pivot of the transferrer, a powder-duct between the ball-reservoirs and in range with the line of travel of the transferrer, a gate arranged movably across the bases of the ball-reservoirs, gages arranged movably across the said reservoirs above the gate, lugs on the transferrer engaging the gate, and arms on the gate operating the gages, substantially as described and shown.

9. The combination of the frame A, provided with the cartridge-receiver C and formed with the duct F', and vertical web A', having transversely through it the ports *f* and *g*, the powder-gage M', pivoted to one side of the said web, and the powder-reservoir M, adapted to communicate alternately with the aforesaid ports, substantially as described and shown.

10. The frame formed with a vertical sleeve provided with a lateral ammunition-duct, a tube secured in said sleeve and provided with a lateral coinciding ammunition-duct and formed below the sleeve with a horizontal opening toward the front and with horizontal projections above and below said opening, vertical perforations in the upper projection, tubular reservoirs inserted into the upper ends of said perforations, a horizontal gate pivoted to the said projection between the perforations thereof and movable into and out of the perforations, a ball-transferrer in the horizontal opening of the aforesaid tube and pivoted to the upper projection thereof and provided with vertical channels, lugs on said transferrer engaging the gate, and the cartridge-receiver attached to the lower end of the tube, substantially as described and shown.

411,591. MOWING-MACHINE. LE ROY O. DREW, Carthage, Dak. Filed Sept. 6, 1888. Serial No. 284,710. (No model.)

Claim.—1. In a mowing-machine, the combination, with a traction-wheel, as described, of an endless chain receiving a traveling motion from the forward motion of the said traction-wheel, a finger-bar carrying the said traveling chain, knife-blades held on the said endless chain, clamping-blades held parallel with the said knife-blades and slightly in front of the same, and guards secured on the said cutter-bar and each carrying a roller, above and below which travel the said clamping-blades and the said knife-blades, respectively, substantially as shown and described.

2. In a mowing-machine, the combination, with a traction-wheel provided with an endless traveling chain, of a finger-bar held to tilt and to swing on the said traction-wheel, an endless sprocket-chain held on the said finger-bar and deriving its motion from the endless chain of the said traction-wheel, guards held on the said cutter-bar and each provided with a roller, and clamping and knife blades held on the said endless sprocket-chain and passing over and under the said rollers, respectively, substantially as shown and described.

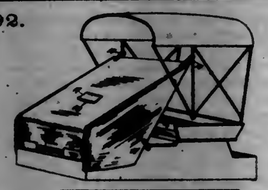
3. In a mowing-machine, the combination, with a finger-bar, of an endless sprocket-chain mounted to travel on the said finger-bar, guards projecting from the said finger-bar and each provided with a roller, and clamping and knife blades held on the said sprocket-chain and passing, respectively, over and under the said rollers, substantially as shown and described.

4. In a mowing-machine, the combination, with guards held on the finger-bar and each provided with a roller, of a clamping-blade adapted to pass over the top of the said roller to clamp the grass in position for cutting, substantially as shown and described.

5. In a mowing-machine, the combination, with guards held on the finger-bar and each provided with a roller, of a clamping-blade adapted to pass over the top of each roller to clamp the grass, and a knife-blade adapted to pass over the said guard and under the said roller to cut the grass clamped between the said roller and clamping-blade, substantially as shown and described.

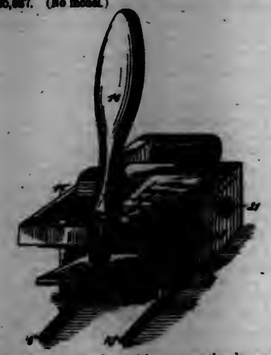
6. In a mowing-machine, the combination, with the track B^5, a plate F, pivoted to the latter, the pivots being arranged transversely of the said track, and thereby adapting the plate to swing vertically in line with it, and a shaft mounted to turn in the said plate and carrying a gear-wheel, of a finger-bar pivotally connected with the said plate, a shaft mounted to turn in the said finger-bar and carrying a pinion meshing into the said gear-wheel, the said shaft imparting motion to an endless chain carrying the knife-blades, and a lever mounted on the track and connected with the said finger-bar for successively tilting and raising the said finger-bar, substantially as shown and described.

7. In a mowing-machine, the combination, with the track B^5, and a plate F, pivoted to the latter, the pivots being arranged transversely of the said track, and thereby adapting the plate to swing vertically in line with it, provided with a stop-lug, of a cutter-bar pivotally connected with the said pivoted plate, a fixed bracket to limit the swinging movement of the said pivoted plate, and a lever mounted on the track and connected with the said finger-bar to tilt and raise the latter successively, substantially as shown and described.



8. In a mowing-machine, the combination, with the track B^5, and a plate F, pivoted to the latter, the pivots being arranged transversely of the said track, and thereby adapting the plate to swing vertically in line with it, having a lug to limit its swinging motion, of a finger-bar pivotally connected at one end to the said pivoted plate, gear-wheels held on the said plate and finger-bar and in mesh with each other at the pivotal line, a chain connected with the said finger-bar, a segmental pulley to which the said chain is fastened, a shaft carrying the said pulley, and a lever mounted on the track and secured on the said shaft for tilting and raising the said cutter-bar, substantially as shown and described.

9. In a mowing-machine, the combination, with the track B^5, and a plate F, pivoted to the latter, the pivots being arranged transversely of the said track, and thereby adapting the plate to swing vertically in line with it, having a lug to limit its swinging motion, of a cutter-bar pivotally connected at one end to the said pivoted plate, gear-wheels held on the said plate and cutter and in mesh with each other at the pivotal line, a chain connected with the said cutter-bar, a segmental pulley to which the said chain is fastened, a shaft carrying the said pulley, a lever mounted on the track and secured on the said shaft for tilting and raising the said cutter-bar, and a notched bracket for locking the said lever in any desired position, substantially as shown and described.



411,592. STORM-APRON FOR VEHICLES. PETER J. GERBER and DAVID B. SHELLY, Pittston, Pa. Filed June 26, 1889. Serial No. 315,982. (No model.)

Claim.—As an improved article of manufacture, a storm-apron consisting of the body portion 10, provided at one end with the flaps 12 and 13 formed from the material forming the apron, and the spring 14, connecting the said flaps, as specified.

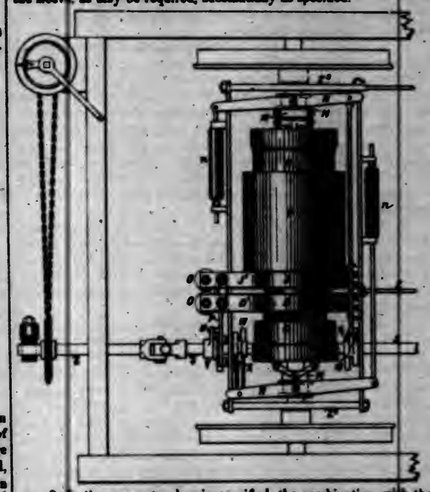
411,592.

411,598. APPARATUS FOR STAMPING ENVELOPES. HARRISON HELLAND and FRANCIS MATSON, Houston, TEX. Filed Feb. 23, 1888. Serial No. 265,667. (No model.)

Claim.—1. The combination, with an operating-lever carrying an affixing plate or pad, a stamp-carrying roller, and a fixed knife, of guide-rollers, a moistening-sponge, a pivoted frame to which the sponge is connected, a movable knife, and gearing, substantially as described, for operating said guide-rollers, sponge-frame, and movable knife in regular sequence, substantially as and for the purpose specified.

2. In a stamp-affixing machine, the combination, with a receptacle provided with an upper compartment and a lower water-compartment, a stamp-carrying roller, and engaging guide-rollers journaled in the upper compartment, the upper guide-roller provided with a pinion and a balance-rod, of a rack engaging the pinion, a notched block attached to the rack engaging the balance-rod, an angular sponge-carrying frame pivoted in the lower compartment, a connection between said sponge-frame and balance-arm, and an angular arm pivoted to the receptacle provided with an affixing-plate and reciprocating the rack, substantially as and for the purpose herein set forth.

3. In a stamp-affixing machine, the combination, with a receptacle provided with an upper compartment and a lower water-compartment, a stamp-carrying roller, and engaging guide-rollers journaled in the upper compartment, the upper guide-rollers provided with a pinion and a loosely-mounted balance-rod, of an angular arm pivoted to the receptacle provided with an affixing-plate, a rack reciprocated from said arm, a notched block attached to said rack engaging the balance-rod, a sponge-carrying frame pivoted in the water-compartment and connected with said balance-bar, and the knives or cutters in front of the guide-rollers, all arranged to operate in regular sequence, as set forth.



4. In a stamp-affixing machine, the combination, with a roller having strips of stamps wound thereon, of guide-rollers located in front of said stamp-rollers, a frame pivoted below the guide-rollers, and a sponge clamped and carried by said frame, adapted to moisten the stamps when delivered from the guide-rollers, substantially as shown and described.

5. In a stamp-affixing machine, the combination, with a sponge provided with a neck and vertical projection from said neck, of a movable frame adapted to embrace said vertical projection, substantially as shown and described.

6. In a stamp-affixing machine, the combination, with a sponge provided with a neck and a vertical projection from said neck, of a perforated pivoted frame adapted to embrace said neck projection, substantially as and for the purpose specified.

411,594. CAR STARTER AND BRAKE. JOHN J. HOSKIN, Tideswell, Stockport, County of Derby, England. Filed July 13, 1888. Serial No. 317,488. (No model.) Patented in France Apr. 7, 1888, No. 189,889; in Belgium Apr. 14, 1888, No. 81,381; in Italy June 30, 1888, XXII, 23,297, XLVI, 76; in Germany Dec. 9, 1888, No. 47,908, and in Austria-Hungary Mar. 5, 1889, No. 44,289 and No. 5,134.

Claim.—1. In a power-storing brake for facilitating the starting of tram-cars, the combination, with a drum, springs, and sleeve connected and arranged as described, and mounted loose on the wheel-axle or on a shaft geared therewith, of brakes independently controlling the rotation of the barrel and of the sleeve, respectively, and of friction-clutches adapted to connect the wheel axle or shaft with the barrel or with the sleeve, respectively, and of oppositely-acting sets of pawl-and-ratchet gear, respectively connecting the barrel and the sleeve with the corresponding brakes and clutches, the whole arranged for storing or giving out power indifferently by the drum or the sleeve, as may be required, substantially as specified.

2. In the apparatus herein specified, the combination, with the independently-acting spring-pressed brake-straps respectively controlling the rotation of the barrel and sleeve, of the lever and crank-gear, substantially as described, by which the brake-straps are separately operated, as specified.

3. In the apparatus herein specified, the combination, with the spring-pressed brake-straps, and with gear by which they are independently released, of the cam-gear, substantially as herein described, whereby the clutches are respectively operated, the connection between the clutch and brake operating gears being such that the one or other of the former must necessarily be caused to gear the barrel or sleeve with the wheel-axle or shaft before the corresponding brake can be relieved, as specified.

4. In the apparatus herein specified, the combination, with the clutches and clutch-levers and clutch operating and locking cam-gear, of spring or yielding fulcra for the clutch-levers, whereby the pressure of the clutches is limited and overstraining is prevented.

5. In the apparatus herein specified, the combination, with the one longitudinal shaft, of the two sets of clutch operating and locking cam-gear, the brake-operating crank-disk and lever-connections, and the carrier and abutments on the crank-disk, whereby independent motion of the said shaft and the clutch-operating gear is permitted within certain limits, as and for the purposes described.

411,595. UNDERGROUND CONDUIT. DAVID M. HYLAND, Chicago, Ill., assignor of one-half to John P. Barrett, same place. Filed Mar. 1, 1889. Serial No. 301,611. (No model.)

Claim.—1. The combination, with the cables of an underground-conduit extending to a building, of a chamber closed to the building, into which chamber the conduit opens, said chamber being provided with an inlet to the outside air and an outlet leading to a flue, substantially as and for the purpose specified.

2. The combination, with the conduit *a*, containing electric conductors, of the chamber *c*, with which said conduit is connected, said chamber being provided with an opening *d* to the outside air, and an outlet *e*, connected with a heated flue, substantially as and for the purpose specified.

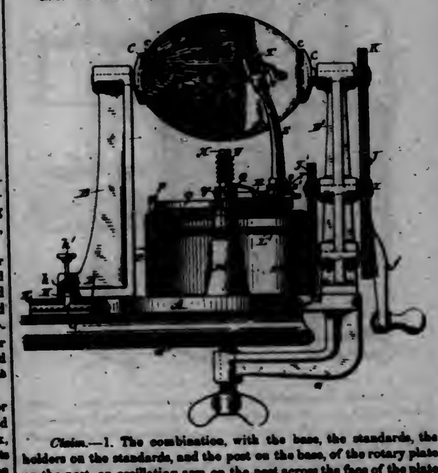
411,596. PERCOLATOR. HANS KIENTH, Milwaukee, Wis. Filed June 24, 1889. Serial No. 315,021. (No model.)

Claim.—1. In a percolator, the combination, with a vessel having interior supporting-lugs near its bottom, of a perforated disk resting on said lugs, a tube extending within said glass and passing through said perforated disk, and a siphon extending into said tube, substantially as set forth.

2. In a percolator, the combination, with a vessel having interior supporting-lugs near its bottom, of a perforated disk resting on said lugs and having a central larger perforation fitted with a perforated cork, a top or cover with similar central perforation and perforated cork, a tube passed through said perforated corks and having a perforated cork at its upper end and openings or notches at its lower end, and a siphon, one end of which is passed through the last-named perforated cork and extended down within said tube, substantially as set forth.

3. In a percolator, the combination, with a vessel having interior supporting-lugs near its bottom, of a perforated disk resting on said lugs and having a central perforation fitted with a perforated cork, a tube having a perforated cork at its upper end and openings at its lower end, passed through said first-named perforated cork, a siphon fitted in said tube, and a cup of felt or cloth having a central perforation fitting around said tube and resting on said perforated disk and against the inner walls of the said vessel, substantially as set forth.

411,597. CART-SEAT. JOHN M. LEE, Douglas, Ark. Filed July 1, 1889. Serial No. 316,351. (No model.)



Claim.—1. The combination, with a seat-supporting frame provided with a central vertical aperture, of the seat B, provided with a depending bolt held in said aperture, provided with a flanged head secured to the under side of the seat, said head provided with a convexed under surface, and a washer disposed upon the bolt between the seat and seat-frame, and provided with a convexed upper surface engaging the flanged head of the bolt, substantially as and for the purpose described.

2. The combination, with the seat-frame provided with a central vertical aperture, of the seat B, provided with a depending pivot-bolt operating in said aperture E, said bolt formed with lateral wings or flanges *c c*, adapted to be bolted to the under side of seat B, the central portion of said flanges formed convexed on their under side, and a nut or washer disposed on said bolt between the seat and supporting-frame, provided with an upper convex surface, substantially as and for the purpose described.

3. The hereinbefore-described improvement in cart-seats, consisting of a supporting-frame A, provided with a central aperture E and a spring-catch I at one side, the seat B, provided with a depending pivot-bolt operating in said aperture E, said bolt provided with a flanged head having a convex bearing-surface on its lower face, depending lugs or stops secured to said seat, adapted to engage the spring-catch I, and a washer disposed between the seat and seat-frame, provided with an upper convexed bearing-surface adapted to engage the flanged bolt-head, all arranged substantially as and for the purpose described.

4. The combination, with the supporting-frame A, provided with a central aperture E, a circular metallic track G, secured thereto, as shown, and a spring-catch I, secured to one side of said frame, of the revolving seat provided with a depending pivot-bolt operating in the aperture E, and provided with a flanged head having a convexed bearing-surface, metallic bearing-plates secured to the under side of said seat, adapted to ride upon the track G, depending stops secured to the seat, adapted to engage the spring-catch I, and a washer disposed on the bolt between the seat and supporting-frame, having a convexed bearing-surface engaging the flanged head of the bolt, all arranged substantially as and for the purpose set forth.

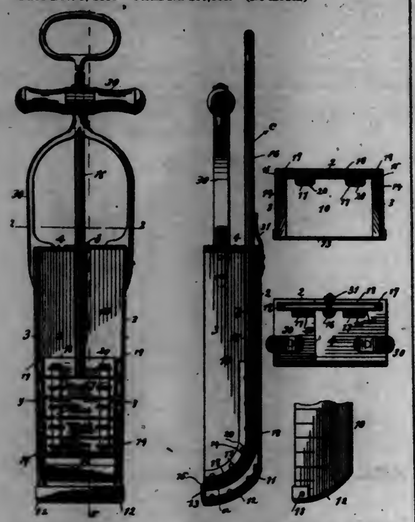
411,598. COCOANUT-PARER. ABRAM W. LEWIS, Asbury Park, N. J. Filed Nov. 23, 1888. Serial No. 291,681. (No model.)

Claim.—1. The combination, with the base, the standards, the holders on the standards, and the post on the base, of the rotary plate on the post, an oscillating arm on the post across the face of the plate and carried in one direction by said plate, a trip for releasing the arm, a spring for returning the arm to its starting-point, an upright knife-post, and a knife-holder carried by the said post, substantially as set forth.

2. The combination, with the base, the standards, the holders, and the post on the base, of the rotary plate on the post between the standards, the horizontally-oscillating and vertically-swinging arm on the post above the plate and having a depending projection engaged by the plate to carry it in one direction, a projection or cam for raising the arm to release its projection from the plate, a spring for returning the arm to its starting-point, and an upright knife-post on said arm and provided with a knife-holder, substantially as set forth.

3. The combination, with a plate having opposite marginal apertures and revolving on a central post projecting from the base, of the horizontal arm having a depending lug to pass into the apertures in the plate, the upright post provided with a paring-knife holder and carried by the horizontal arm, and means for revolving the plate, substantially as shown and described.

4. The combination, with the circular plate revolved by gearing on a central post and having opposite marginal apertures, of a horizontal arm having a depending lug to set in the apertures and fitted loosely to the central post, a spring coiled around the central post and set in the horizontal arm, an upright post carrying a paring-knife and secured to the horizontal arm, and a releasing-cam placed to release the horizontal arm from the revolving plate, substantially as shown and described.



5. A knife-holder containing a paring-knife and having a concave face, swiveled on an upright post, to carry the knife over the surface of the cocoanut in paring the same, substantially as shown and described.

6. The combination, with a revolving plate carried on the hub of a gear and revolving on a central post, of the horizontal arm secured

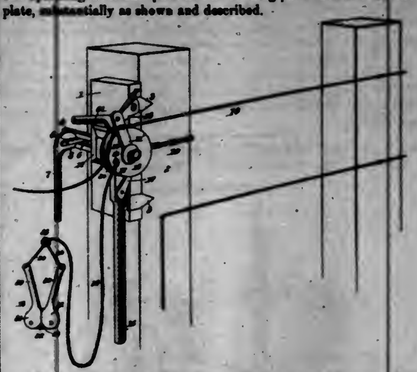
to a collar fitted loosely on the central post, an upright post carrying a paring-knife and secured to the horizontal arm by a hinge-joint, a coiled spring placed to stiffen said joint, and a spring coiled around the central post and attached to the arm and post, substantially as shown and described.

7. The combination, with a fixed and an adjustable standard, and holders revolubie in said standards, of a fixed post, a revoluble plate, a knife-post, an arm carrying the knife-post loosely mounted on the fixed post, and provided with a lug engaging the revoluble plate, a spring on the fixed post engaging said loose arm, and a cam in the path of said arm, substantially as shown and described.

411,599. BUTTER-CUTTER. JOSEPH H. LOCKER, Vall's Gate, N. Y. Filed Nov. 5, 1888. Serial No. 290,008. (No model.)

Claim.—1. The combination, with a supporting-frame or body provided with curved ways, of a blade mounted to slide in said ways, a handle, and a flexible connection between the blade and handle, substantially as described.

2. The combination, with a supporting-frame or body having an open side and end and provided with curved ways, of a blade mounted within said ways, a blade-handle, and a flexible connection between said blade and handle.



3. The combination, with a supporting-frame or body provided with tapering side walls and with curved ways, of a blade mounted to slide in said ways, a blade-handle, and a flexible connection between said blade and handle.

4. The combination, with a supporting-frame or body provided with curved ways, of a knife or blade 15, provided with lugs which ride in said ways, cross-strips 18, also provided with lugs which ride in the ways, spring-strips connected to the knife and to the cross-pieces, and a handle connected to the upper cross-piece, substantially as described.

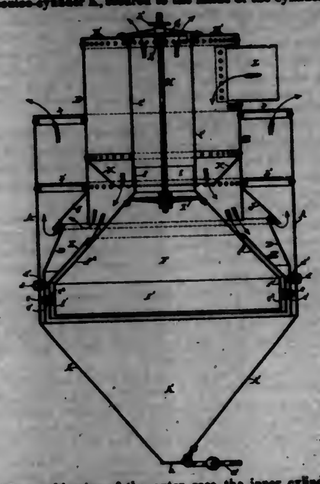
411,600. WIRE-STRETCHER. DAVID H. LOSH, Paradise, Cal. Filed May 7, 1888. Serial No. 273,202. (No model.)

Claim.—1. A wire-stretcher consisting of a plate having a lateral slotted arm, a slotted bar projecting through the slotted arm, movable therein and having a retaining projection at one end, and a lever with a cam-shaped head pivoted to the other end, a securing-chain attached at one end to the plate and adapted to engage with the slotted bar by means of the retaining-catch on the said slotted bar, a drum mounted on the plate, with a ratchet, an operating-lever, and retaining and operating pawls, a wire-clamp for holding the end of a fence-wire, and a rope or chain connecting the wire-clamp with the drum and adapted to wind on the latter, substantially as shown and described.

2. In a wire-stretcher, a plate to rest against a fence-post, having a lateral slotted arm, a slotted bar projecting through the lateral slotted arm, movable therein and having a retaining-catch on one end and a lever with a cam-shaped head pivoted to the other end, a chain for securing the plate to a fence-post, attached at one end to the plate and adapted to engage with the slotted bar by means of the retaining-catch on the end of said slotted bar, and a winding-drum with a ratchet and operating lever and pawl and a retaining pawl mounted on the plate, substantially as shown and described.

3. In a wire-stretcher, the plate 1, with projections 3 on one edge, the lateral arm 4 on the other edge, with slot 5, movable bar 6, with slot 11, projecting through a slotted arm 4, and having a projection 9 on one end and a lever 7, with cam-shaped head 8, pivoted to the other end, the chain 10, having one end connected to plate 1 and adapted to extend through slotted bar 6 and engage projection 9, the drum 13, with cut-away portion 29 in its flange 30, and clamping-lever 31, with cam-shaped head 32, wedging against drum 13, the ratchet 14, operating-lever 16, operating-pawl 17, and retaining-pawl 15, engaging ratchet 14, substantially as shown and described.

411,601. APPARATUS FOR MOISTENING AND SEALING ENVELOPES. NAPOLEON MATTE and CHARLES MONTMINY, Quebec, Quebec, Canada. Filed Feb. 20, 1889. Serial No. 300,597. (No model.)



Claim.—1. In an apparatus for moistening and sealing the gummed flaps of envelopes and other wrappers, the combination, with a bed-plate for supporting the gummed edge, of the pivoted cylindrical water-reservoir 6, the flat hollow open-ended projection 7, forming a lateral tubular extension of said reservoir, and a pad 8, held in the said projection, from which it may extend into the reservoir, as shown and described.

2. An apparatus for moistening and sealing the gummed flaps of envelopes, wrappers, and labels, consisting of the frame 1, formed of the flat boxing 2, with the rear vertical projections 4, the plate 20, with supporting spring ends 21, located in the forward part of boxing 2, the cylindrical reservoir 6, pivoted in the projections 4 and having the moistening-pad holder 7, projecting over the boxing 2, with the cut-away portion 12 and the moistening-pad 8, held in projection 7 and extending into reservoir 6, and the weighted plate 10, pivoted at its rear end to the lower part of projections 4, and having its front end resting on the outer edge of boxing 2, with the angular projection 11 on its upper surface conforming to the cut-away portion 12 in the pad-holder 7, substantially as shown and described.

411,602. DUST-COLLECTOR. BENJAMIN F. HIMMELSBERGER and CHARLES S. MCCOY, Chattanooga, Ohio. Filed June 20, 1888. Serial No. 314,973. (No model.)

Claim.—1. In a dust-collector, the combination of the outer shell A A', the cylinder B, and stay-bars connecting them and leaving a free air passage at top between the two, the inner cylinder C, open at the top, the cap B', to close the opening between cylinders B and C, the inlet L, to the top of the chamber between the cylinders B C, and the inverted funnel F, connected to the lower end of cylinder C and having its enlarged flaring lower end extending outwardly, so as to form a contracted annular passage between it and the shell A, substantially as and for the purpose set forth.

2. The combination, substantially as hereinbefore set forth, of the cylinders A B C, connected together, as shown, the inverted funnel F, connected at its upper end with the inner cylinder C, the cap B', closing the top of cylinder B, surrounding the central opening, and the inverted conical cylinder K, secured to the inside of the cylinder B.

3. The combination of the outer case, the inner cylinders B C, and inverted funnel F, connected together, as shown, with the shell K, secured to the cylinder B, the shell D, secured in the lower part of the outer case, and the bolts, nuts, and collars for securing the said shell D to the other shell and leaving an air-space between them, substantially as shown and described.

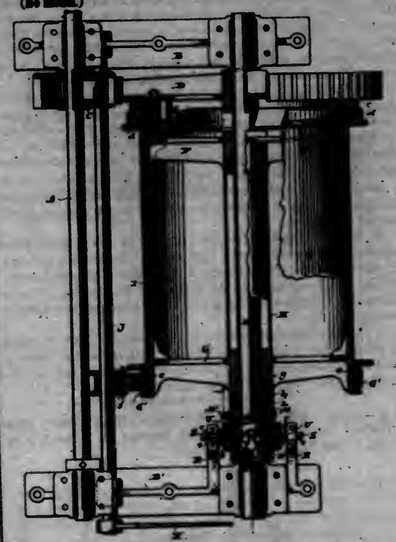
4. The combination of the outer case, the inner cylinders B C, the cap B', closing the top of the cylinder B, the shell F, connected to the cylinder B, the shell D, within the lower part A of the outer case and separated therefrom, and the shell J, secured at its smaller end around the cylinder B and having its lower flaring edge overhanging the upper edge of the cylinder D, substantially as shown and described.

5. The combination, substantially as specified, of the outer shell A A', the cylinder B, and stays *b b'*, connecting the two, the inverted-funnel-shaped shell consisting of the parts F *f f'*, and cylinder C, centrally located within said shells A B, the shell D within the lower part A of the outer case, the shell J, overhanging the upper end of shell D, and the shell K, secured inside of cylinder B to deflect the air toward the shell of said central funnel.

6. The combination of the outer shell A A', the cylinder B, cylinder C, and shell F *f f'*, the shell J, outside of cylinder B, and shell K, within it, and the shells D and E, arranged in the lower part A of the outer case and separated from each other, substantially as shown, and for the purpose specified.

7. The combination, substantially as set forth, of the outer case A A', the cylinders B C, the stays to connect the case to cylinder B, the cap inclosing the space between the two cylinders at the top, the shells D E, arranged in the lower part of the case, with the shell F, having the neck *f* to slide within the lower end of cylinder C, and the part *f'*, parallel with the inclined portion of the shell E, and means, such as shown, to vertically adjust the shell F with relation to the shell E to regulate the passage between the two, for the purpose set forth.

8. In a dust-collector such as described, consisting of cylindrical shells, one within the other, and separated, as shown, the said outer and inner cylinders being open at the top, and the intermediate cylinder closed at the top and having an induction-port near its upper end, the combination of the shell F, having neck telescoped in the lower end of the central cylinder, the spider secured to said shell, the bar G, crossing the upper end of the said central cylinder, the rod H, passing through said bar and having its lower end secured to the spider, the hand-wheel and nuts to vertically adjust the shell F, and the outer shell E, of similar shape surrounding said shell, for the purpose set forth.



411,603. STOVE OR FURNACE DAMPER. ALBERT M. HOUGHAM, Port Townsend, Wash. Filed May 5, 1889. Serial No. 310,049. (No model.)

Claim.—1. In combination, a stove-pipe having a slot therein, a plate affixed to the pipe and having a corresponding slot, the said plate carrying a bearing for the damper-axle, a revolving damper having its axle resting on said bearing, and a cover for the said slotted plate.

2. A damper attachment for stove or furnace pipes, consisting of a plate having a slot therein, and a bearing for the damper-axle, said slotted plate being provided with a cover, substantially as and for the purpose set forth.

411,604. HOISTING-MACHINE. EDWARD Y. HOUSE and HENRY B. TEVIS, Milwaukee, Wis. Filed Mar. 20, 1889. Serial No. 303,942. (No model.)

Claim.—1. In a hoisting-machine, the combination of a longitudinally-adjustable winding-drum and a friction-ring adjustable to or from the winding-drum simultaneously with the longitudinal movement of the latter, substantially as set forth.

2. In a hoisting-machine, the combination of a longitudinally-adjustable shaft, a friction-ring carried by the shaft, and a winding-drum longitudinally adjustable on the shaft simultaneously therewith and to or from the friction-ring, substantially as set forth.

3. In a hoisting-machine, the combination of a shaft, a friction-ring carried by the shaft, a winding-drum loose on said shaft in opposition to the friction-ring, opposing disks also loose on the shaft, spreaders interposed between the disks, a collar on the shaft in opposition to one of the disks, a sleeve interposed between the other disk and adjacent head of the drum, and a lever mechanism connected to the spreaders, substantially as set forth.

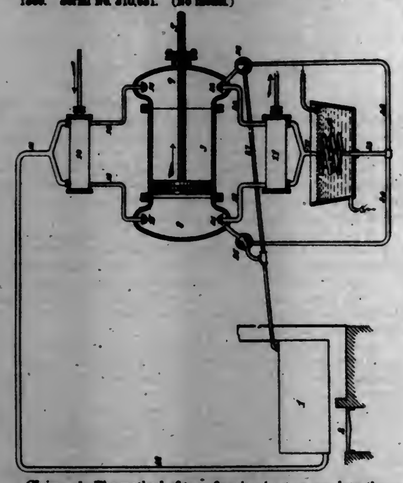
4. In a hoisting-machine, the combination of a shaft, a friction-ring carried by the shaft, a winding-drum arranged on said shaft in opposition to the friction-ring, opposing disks also loose on the shaft, spreaders interposed between the disks, a collar on the shaft in opposition to one of the disks, a sleeve interposed between the other disk and adjacent drum-head, an adjusting-nut screw-threaded to the sleeve, and a lever mechanism connected to the spreader, substantially as set forth.

5. In a hoisting-machine, the combination of a shaft, a friction-ring carried by the shaft, a winding-drum loose on said shaft in opposition to the friction-ring, opposing disks also loose on the shaft, spreaders interposed between the disks, a collar on the shaft in opposition to one of the disks, a sleeve arranged to impinge against the other disk, an anti-friction washer interposed between the sleeve and adjacent drum-head, and a lever mechanism connected to the spreaders, substantially as set forth.

6. In a hoisting-machine, the combination of a shaft, a friction-ring carried by the shaft, a winding-drum loose on said shaft, opposing disks also loose on the shaft, spreaders interposed between the disks and provided with squared shanks, a collar on the shaft in opposition to one of the disks, a sleeve interposed between the other disk and adjacent drum-head, collared trunnions screw-threaded to the spreaders, bearings for the trunnions, a ball having its ends fitted to the

shanks of said elliptical nuts, washers arranged on the trunnions between the collars thereon and bail, and a lever connected to said bail, substantially as set forth.

7. In a hoisting-machine, the combination of a shaft, a friction-ring carried by the shaft, a winding-drum loose on said shaft, opposing disks also loose on the shaft and provided with interlocking fingers, spreaders interposed between the disks, a collar on the shaft in opposition to one of the disks, a sleeve interposed between the other disk and adjacent drum-head, and a lever mechanism connected to the spreaders, substantially as set forth.



8. In a hoisting-machine, the combination of a shaft, a friction-ring carried by the shaft, a winding-drum loose on said shaft, opposing disks also loose on the shaft and provided with lugs, a slotted bracket arranged to engage said lugs, spreaders interposed between the disks, a collar on the shaft in opposition to one of the disks, a sleeve interposed between the other disk and adjacent drum-head, and a lever mechanism connected to the spreaders, substantially as set forth.

9. In a hoisting-machine, the combination of a shaft, a friction-ring carried by the shaft, a winding-drum loose on said shaft in opposition to the friction-ring, opposing disks also loose on the shaft and provided with horizontal interlocking fingers and vertical lugs, a slotted bracket arranged to engage said vertical lugs, spreaders interposed between the disks, a collar on the shaft in opposition to one of the disks, a sleeve interposed between the other disk and adjacent drum-head, and a lever mechanism connected to the spreaders, substantially as set forth.

10. In a hoisting-machine, the combination of a longitudinally-adjustable shaft provided with a rigid collar, a friction-ring having a rigid connection with the shaft, and a longitudinally-adjustable winding-drum interposed between the collar and friction-ring to move simultaneously with said shaft to or from the friction-ring, substantially as set forth.

11. In a hoisting-machine, the combination of a shaft provided with a rigid collar, a friction-ring having a rigid connection with the shaft, and a winding-drum loosely arranged on said shaft between the collar and friction-ring, substantially as set forth.

411,606. METHOD OF TRANSFORMING HEAT ENERGY INTO MOTIVE POWER. JAMES J. MCTIGUE, Pittsburg, Pa. Filed May 13, 1889. Serial No. 310,691. (No model.)

Claim.—1. The method of transforming heat energy into the energy of tension of a vapor, consisting in heating a liquid and pumping it in a divided state into a body of air or other gas or vapor of lower temperature.

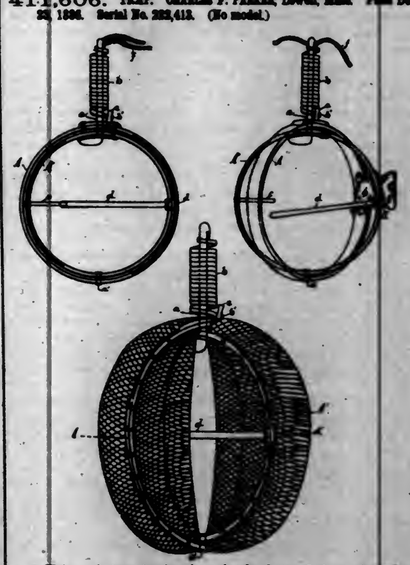
2. The method of transforming heat energy into the energy of tension of vapor, consisting in heating a liquid under pressure and pumping it in a subdivided state into a body of air or gas or vapor also under pressure, but of lower temperature.

3. The method of transforming heat energy into the energy of tension of a vapor, consisting in heating a liquid under pressure sufficient to prevent ebullition and pumping such liquid in an atomized form into a body of air, gas, or vapor.

4. The method of transforming heat energy into the energy of tension of a vapor, consisting in heating a liquid under pressure independent of that due to its own vapor and sufficient to prevent ebullition, and injecting such liquid into a body of air, gas, or vapor having a pressure above that of such boiling-point of said liquid.

5. The method of transforming heat energy into motive power in a piston-engine, consisting in maintaining a working-body of air, gas, or vapor behind the piston in said engine and injecting at once into the whole body of such air, gas, or vapor a liquid heated to a higher temperature, and thereby increasing the tension of such atmosphere and moving the piston.

6. The method of transforming heat energy into motive power in a piston-engine, consisting in maintaining a working-body of air, gas, or vapor behind the piston in said engine and injecting at once into the whole body of such air, gas, or vapor a liquid heated to a higher temperature and in a subdivided state.



7. The method of transforming heat energy into motive power in a piston-engine, consisting in maintaining a working-body of air, gas, or vapor behind the piston in said engine and injecting at once into the whole body of such air, gas, or vapor a spray of liquid heated to a higher temperature.

8. The method of transforming heat energy into motive power in a piston-engine, consisting in maintaining a working-body of air, gas, or vapor under pressure behind the piston in said engine and injecting at once into the whole body of air, gas, or vapor a spray of liquid heated to a higher temperature.

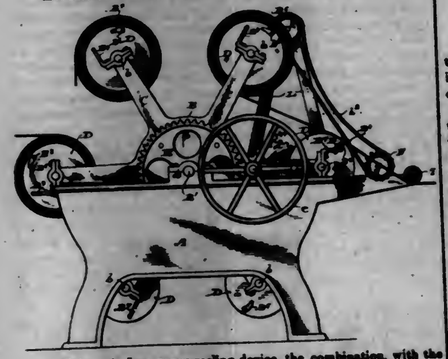
9. The method of transforming heat energy into motive power in a piston-engine, consisting in maintaining two separate working-bodies of air, gas, or vapor—one ahead of the piston, the other behind it—and injecting into the body of air, gas, or vapor behind the piston a spray or stream of heated liquid and into the body of air, gas, or vapor ahead of the piston a spray or stream of cooler liquid.

10. The method of transforming heat energy into motive power in a piston-engine, consisting in maintaining two separate working-bodies of air, gas, or vapor—one ahead of the piston, the other behind it—and injecting into the body of air, gas, or vapor behind the piston a spray or stream of heated liquid and into the body of air, gas, or vapor ahead of the piston a spray or stream of cooler liquid, and then reversing the hot and cold sprays relatively to the two bodies of air, gas, or vapor on the respective sides of the piston.

411,606. TRAP. CHARLES F. PARKER, Lowell, Mass. Filed Dec. 23, 1886. Serial No. 222,412. (No model.)

Claim.—A trap having jaws in the form of rings, pivoted one within the other at diametrically-opposite points, one of said pivots being a spindle secured to said inner ring and projecting through said outer ring, a spiral spring surrounding said spindle outside of said rings and secured at one end to said spindle and at the other end to said outer ring, a catch projecting inward from said inner ring, and a trigger or bar hinged to said inner ring opposite said catch and extending outward to engage said outer ring and inward to engage said catch, as and for the purpose specified.

411,607. HORSE HAY-RAKE. SAMUEL PETTIT and WILLIAM LOTTRIDGE, Grinnell, Iowa, assignors to Cleaver, Shuttz & Austin, same place. Filed July 5, 1888. Serial No. 316,927. (No model.)

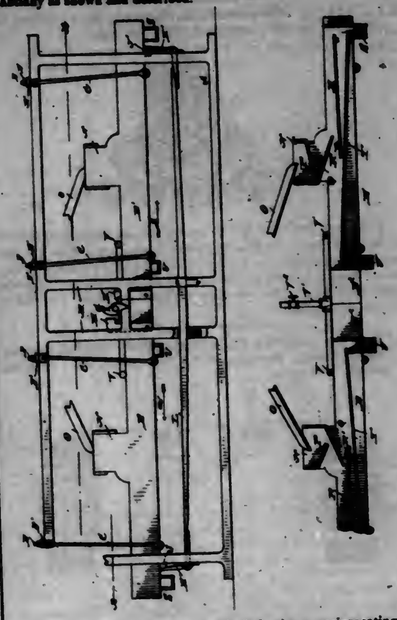


Claim.—1. In a horse hay-rake, in combination with the frame or draft-bars, oscillating tooth-carrying head and toggle-levers, one of which is pivoted to the frame or draft-bars and the other to the oscillating tooth-carrying head, and one of which is perforated with a series of holes *d*, a pivot-bolt for pivotally connecting the two members of the toggle-lever, which pivot-bolt is carried upon a thumb-lever, by means of which it may be released from and engaged with said toggle-lever bars, substantially as described.

2. In a horse hay-rake, in combination, a frame or draft-bars, oscillating tooth-carrying head and toggle, one member of which is perforated with a series of holes *d* and provided with a perforated plate K, having a guide-groove *k*, and the other member of which carries a spring-actuated thumb-lever with an attached pivot-bolt G, and a bracket *i*, with a guide-lug *i'*, substantially as described.

3. In a horse hay-rake, in combination with the rake-teeth, swinging toggle-levers, the pivot-bolt G, fixed to a spring-actuated thumb-lever H, substantially as described, and for the purpose specified.

411,608. PAPER-REEL. EDWARD J. POPE and CHARLES H. POPE, Eau Claire, Wis. Filed Sept. 3, 1888. Serial No. 284,413. (No model.)



Claim.—1. In a paper-reeling device, the combination, with the frame and reels and their pinions and a fixed power-driven pinion for successively revolving said reels, of a suitably-driven chain arranged to overhang the path of each newly-filled reel while it is rising to give place to an empty reel and to engage the pinion of said filled reel and revolve it until the paper is taken by the next lower reel, substantially as described.

2. The combination, with a paper-reel frame and reels carried thereby, of pinions fixed on the shafts of said reels, a suitably-driven stationary pinion for revolving each reel in succession when the reel-frame is at rest, and other driving-connections adapted to engage the pinion of each newly-filled reel as it is lifted by the turning of the reel-frame to give place to an empty reel, substantially as described.

3. The combination, with a paper-reel frame, of a reel, a rock-shaft, and clamping and cutting teeth carried thereby, a dog secured to one end of the rock-shaft, and a tripping-arm carried by the reel-frame arm and adapted by engagement with said dog to revolve the rock-shaft and cause the teeth to clamp and cut the paper as the reel revolves under it, substantially as described.

411,609. ORE-CONCENTRATOR. SAMUEL PORTER, Denver, Colo. Filed June 6, 1889. Serial No. 276,904. (No model.)

Claim.—1. In an ore-concentrator, two beds having a reciprocating motion in opposite directions and one abutting against the other at the inward stroke, and means for operating the beds, substantially as shown and described.

2. In an ore-concentrator, two beds having a reciprocating motion in opposite directions and one abutting against the other at the inward stroke, said beds being provided with inclined tables and an operating mechanism, substantially as shown and described.

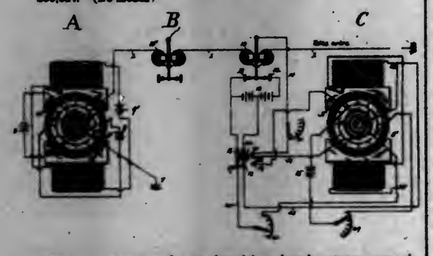
3. The combination, with the reciprocating bed having transverse troughs S U at its ends, and a table T, inclined upwardly from the front to the rear trough, of the upper table R, rigidly secured in the bed and inclined downwardly and rearwardly from a point above the front trough S, into which it discharges to a point just above the middle portion of the lower table, and the hopper fixedly secured to the bed and having oppositely-inclined bottoms P Q, the bottom Q being inclined forwardly and terminating just above the inner edge of the table R, substantially as set forth.

4. The reciprocating bed having troughs S U at its front and rear ends, the table T, inclined upwardly and rearwardly from the front to the rear trough, the hopper N, fixedly secured to the bed about midway of its length and having oppositely-inclined bottoms P Q, the bottom Q being inclined toward the front end of the bed, the upper table R, inclined rearwardly and downwardly from a point above the trough S to a point between the bottom Q and the lower table, the rib R' on the upper side of the rear end of the table R, just in rear of the delivery end of the bottom Q, in combination with the perforated water-pipe extending across the bed between the hopper and the rear trough, substantially as set forth.

5. The combination, with two beds reciprocating toward and from each other and abutting at their inner ends, troughs at opposite ends of the beds, a table T, inclined upwardly and rearwardly from the front to the rear trough, the shorter upper table inclined downwardly and rearwardly from a point above the front trough, the hopper fixedly secured to the bed and having oppositely-inclined bottoms, the lower one of which is inclined downwardly and forwardly to a point just above the lower inner end of the upper table, and the transverse water-pipe between the rear trough and the hopper, of a rotary cam acting upon both beds simultaneously to force them apart, and springs throwing the beds suddenly into contact at their inner ends when released by the cams, substantially as set forth.

6. An ore-concentrator consisting in the frame, the oppositely-reciprocating beds, their troughs, tables, and hoppers, a rotary cam acting simultaneously upon both beds to force them apart, bell-crank levers mounted on the frame with their vertical members engaging the forward ends of the beds and their horizontal members extending toward each other, and the longitudinally-extending spring L, secured

to the frame between its ends and engaging at its ends the inner ends of the horizontal members of said bell-crank levers, substantially as set forth.



411,610. JUICE-EXTRACTOR. CHARLES H. READ, Pittsburg, Pa.

Filed May 22, 1889. Serial No. 311,711. (No model.)

Claim.—A device for extracting the juice and pulp from lemons and similar fruits, a conoidal-shaped body having longitudinal grooves extending from its base to its apex, and intermediate flutings having inverted-V-shaped grooves, forming a series of upwardly-projecting cutting-edges to strip the pulp from the inner portion of the rind of the fruit, as specified.

411,611. SYSTEM FOR SYNCHRONIZING ELECTRIC MOTORS. ROBERT H. READ, Washington, D. C. Filed Feb. 12, 1889. Serial No. 299,657. (No model.)

Claim.—1. A system for synchronizing electric motors, comprising a controlling-circuit, a series of electric motors controlled thereby, a current-changer for producing periodic current changes in the controlling-circuit, and a commutator actuated by the moving part of each motor for redirecting the current changes at times corresponding to said changes, whereby the attractive effort on the moving part is removed when the current-changers do not coincide and synchronism fails.

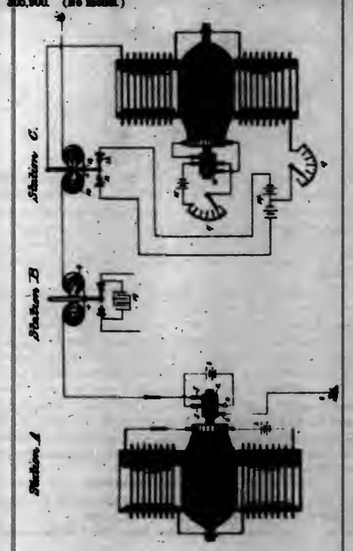
2. A system for synchronizing electric motors, comprising a series of motors adapted to operate under a continuous polarity of their field-magnets and armature, a controlling-circuit for said motors, a current-changer for producing periodic current changes in said circuit, and a commutator actuated by the moving part of each driven motor for redirecting the current changes at times corresponding to said changes, whereby the attractive effort on the moving part is removed when the current-changers do not coincide and synchronism fails.

3. A system for synchronizing electric motors, comprising a controlling-circuit, a current-changer for producing periodic current changes therein, one or more electric motors of the ring or drum armature type controlled by the current changes, a pole-changer for each motor operated by the current changes, and an auxiliary pole-changer driven by the motor for reversing the current from the first pole-changer in the exciting-coils of one magnetic element of the station-motor at times corresponding with the reversals of the first pole-changer, whereby a retarding effect will be exerted on the moving part of the station-motor when the two pole-changers fail to coincide or when synchronism varies.

4. A system for synchronizing rotating parts at two or more distant stations, comprising a controlling-motor of any kind, one or more controlled electric motors of the ring or drum armature type, pole-changers actuated by the controlling and the controlled motors, respectively, an electric circuit including a source of energy through both pole-changers and the exciting-circuit of one of the magnetic elements of the controlled motor, and a source of constant energy in the exciting-circuit of the other magnetic element of the controlled motor.

5. A system for synchronizing electric motors, comprising a line-circuit, means for producing periodic reversals of current in said circuit, relays at two or more distant stations operated by the line-current, a pole-changer for a local battery operated by each relay, a series of motors of the ring or drum armature type at the stations, a rotating pole-changer carried by the moving part of each motor, and electric connections between the two pole-changers and the exciting-coils of one magnetic element of the station-motor, whereby its polarity will be reversed when the reversing times of the two pole-changers do not coincide.

6. A system for synchronizing electric motors, comprising a controlling-motor at one station, a pole-changer operated by said motor, a line-circuit, a controlled motor of the ring or drum armature type at a distant station, and a pole-changer carried by its rotating part in circuit with the exciting-coils of one of its magnetic elements, said pole-changer redirecting the reversals caused by the controlling-motor, whereby when synchronism fails a retarding effect will be exerted upon the controlled motor until synchronism is re-established.



7. A system for synchronizing electric motors, comprising a line-circuit in which periodic current changes are produced, a pole-changer at each controlled station operated by the changes on line, a motor of the ring or drum armature type at each controlled station, said motor having independent field and armature circuits and sources of energy for said circuits, an auxiliary pole-changer carried by the moving part of the motor, and electric connections between the two pole-changers and one of the independent circuits, whereby its current will be of constant direction only so long as the movements of the two pole-changers coincide, and whereby synchronism will be preserved.

8. A system for synchronizing electric motors, comprising a line-circuit, a current-changer for producing periodic current changes in said line-circuit, an electric motor at a controlled station, through which retarding-current impulses are caused to pass by the line-current changes, and local sources of energy for driving said motor at a faster rate than the changes of line-current, whereby synchronism may be preserved by retarding impulses.

9. A system for synchronizing electric motors, comprising two or more motors at distant stations, a line-circuit connecting the stations, means controlled by line impulses for correcting slight variations from synchronism of the motors, a switch at each controlled station, and a source of energy controlled by said switch having an electro-motive force sufficient to drive the motor at a pace where the line-correction may be asserted, whereby a driven motor may be brought into synchronism with another without slowing down the latter.

10. A system for synchronizing electric motors, comprising a controlling-circuit, a current-changer for producing periodic current changes in said circuit, an electric motor at each controlled station having its rate of movement dependent upon said current changes, a source of energy exciting the controlled motors having an electro-motive force sufficient to keep them in advance of the current changes at determinate stages of their movement, and a variable resistance for adjusting the strength of current in the motor circuit or circuits for regulating the amount of such lead.

411,612. SYSTEM FOR SYNCHRONIZING ELECTRIC MOTORS. ROBERT H. READ, Washington, D. C. Filed Apr. 3, 1889. Serial No. 305,900. (No model.)

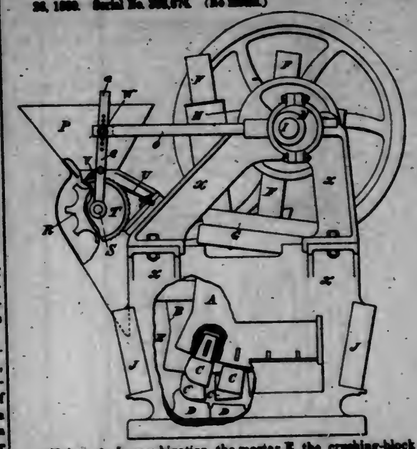
Claim.—1. A system for synchronizing electric motors, comprising a controlling-circuit, a current-changer for producing periodic current changes in said circuit, two or more motors at distant stations, having field-magnet and armature circuits, in one of which circuits current varies in accordance with the changes in the controlling-circuit, and a local-current changer actuated by the moving part of each driven motor for producing corresponding changes in the other motor-circuit, whereby a continuous driving effort will be maintained on the driven motor as long as the changes in the two motor-circuits are simultaneous.

2. A system for synchronizing electric motors, comprising a controlling line-circuit, a current-changer for producing periodic current changes in said circuit, one or more driven motors having independent field-magnet and armature circuits, one of which varies in accordance with the line changes, the other containing a local-current changer actuated by the moving part of the driven motor, whereby a continuous driving effort will be maintained on the driven motor as long as the changes in the two independent circuits are simultaneous.

3. A system for synchronizing electric motors, comprising a controlling line-circuit in which periodic current changes are produced, one or more driven motors of the ring or drum armature type governed by said circuit, the driven motor having field-magnet and armature circuits, in one of which current is reversed in accordance with the line-current changes, and a pole-changer actuated by the moving part of the driven motor for producing reversals in the other motor-circuit at times corresponding to the line changes, whereby simultaneous reversals and continuous driving effort are produced so long as the moving part is synchronous with the line changes.

4. A system for synchronizing electric motors, comprising a controlling line-circuit in which periodic current changes are produced, one or more driven motors of the ring or drum armature type governed by said circuit, a pole-changer for reversing the magnetism of one element of a driven motor in accordance with the changes of the line-current, a pole-changer actuated by the moving part of the driven motor for reversing the magnetism of the other element of the motor at times corresponding to the line changes, and a variable resistance in one or both motor-circuits for varying the strength of its exciting-current, for the purpose described.

5. A system for synchronizing electric motors, comprising a controlling line-circuit in which periodic current changes are produced, an electro-magnet having a neutral core in said line-circuit, a vibrating armature actuated by said magnet in accordance with the line changes, a driven motor having one of its circuits reversed by the vibrating armature in accordance with the line changes and a pole-changer actuated by the moving part of the driven motor for reversing current in the other motor-circuit at times corresponding to the line changes, whereby simultaneous reversals and therefore continuous driving effort are produced so long as the moving part is synchronous with the line changes.



6. A system for synchronizing electric motors, comprising a controlling line-circuit in which periodic current changes are produced, an electro-magnet having a neutral core in said line-circuit, a vibrating armature actuated by said magnet in accordance with the line changes, a driven electric motor, and a local source of energy connected to the driven motor and the vibrator, whereby the speed of the motor conforms to the current changes on line and high speeds of the vibrators and driven motors may be maintained.

411,613. TROLLEY FOR ELECTRIC-RAILWAY SYSTEMS. ANDREW L. REES, New York, N. Y. Filed Apr. 22, 1889. Serial No. 308,147. (No model.)

Claim.—The combination of the support pivoted so as to turn on a vertical axis, the swinging arm pivoted to said support and capable of turning on its pivot, so as to incline either forward or backward, and a spiral spring connected with said arm and support and tending to resist the bending of said arm in either direction, substantially as described.

411,614. CRUSHING-MILL. ALPHEUS B. ROE, San Francisco, Cal., assignor to Henry L. Tatum and J. J. Brown, same place. Filed Apr. 26, 1889. Serial No. 308,676. (No model.)

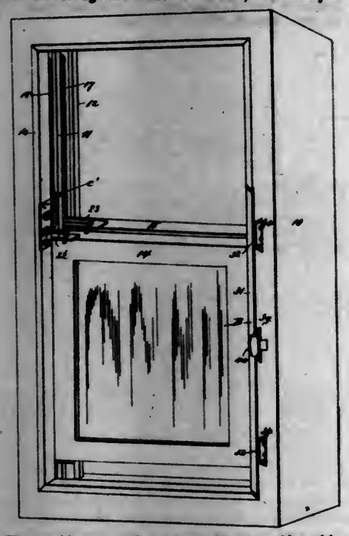
Claim.—1. In combination, the mortar E, the crushing-block A therein, the feed mechanism for supplying material to the mill, the shaft I, and driving-connections between said shaft and the block and between said shaft and the feed mechanism, substantially as described.

2. In combination, the mortar E, the block A therein, the feed mechanism consisting of the hopper P, the roller R, and ratchet T, driving-connections between the shaft I and the crusher A, and driving-connections to the ratchet, consisting of the eccentric N on the shaft I, the rod O, lever Q, adjustably connected thereto, and the pawl, substantially as described.

3. In a crushing-mill, the combination of a mortar with a crushing-block having an upwardly-extending stem, a sliding sleeve loosely embracing said stem, a driving-shaft, and a connection between said sleeve and driving-shaft for imparting power to the crushing-block, substantially as described.

4. In combination, the mortar, the crushing-block having a stem F, a shaft I, positioned to one side of the stem, and a connection between the stem and shaft, consisting of the disk K and crank-pin *g g'*, fixed in its face, sleeve H on the stem, having the extension *a*, of T shape, and blocks *b b'*, embracing the crank-pin and said extension.

5. In a crushing-mill, the mortar and a crushing-block, said block having an upwardly-extending stem and having its upper part formed into an oil-receptacle G, substantially as described.



411,615. WINDOW. JONAS R. ROSSER, Philadelphia, Pa. Filed Oct. 31, 1888. Serial No. 289,698. (No model.)

Claim.—1. The combination, with a window-frame having opposite sashways, one of which is provided with vertically-folding arms having pintles and the other with a movable bead or strip, of a vertically-sliding sash having sockets in its top and bottom at one side, the said folding arms being spaced apart a distance equal to the height of the sash, whereby the sash may be supported on the two pintles while held in its ways, substantially as set forth.

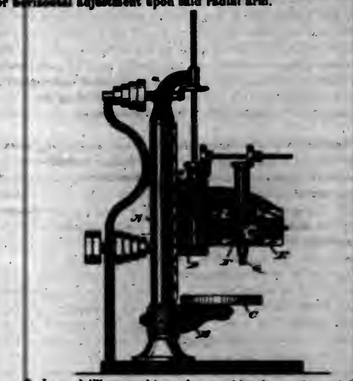
2. The combination, with the window-frame having opposite sashways, one of which has an outwardly-movable strip or bead, and upper and lower vertically-swinging arms in the sashway provided with pintles, of a sash movable vertically in said ways and provided on its top and bottom at one side with elongated sockets, the swinging arms being spaced apart a distance equal to the height of the sash, substantially as set forth.

3. The combination, with a window-frame having opposite sashways for the upper and lower sashes, each provided at one side with upper and lower vertically-swinging arms having pintles, and the opposite sashways having the parting bead or strip, and the inner strip connected and mounted to slide inwardly on the sash-frame, of vertically-movable sashes having sockets in their tops and bottoms at one side to engage said pintles, the swinging arms in both sashways being spaced apart a distance equal to the height of the sash they are to support, substantially as set forth.

4. The combination, with a window-frame, of folding plates arranged in the sash-runways at one side of the case, folding arms arranged above the plates, pintles carried by the plates and arms, a bolt arranged in connection with the folding arms, window-sash provided with sockets adapted to receive the pintles, a detachable frame B, and a means for connecting said frame to the case, substantially as described.

5. The combination, with a window-frame provided with a recessed parting-strip, as 11, and a recessed guiding-strip 13, of a shaft mounted in a recess formed in the window-frame, arms 22 and 23, carried by said shaft, pintles carried by the arms, said arms being arranged to enter the recesses in the guiding-strip and parting-strip, folding plates or arms 19 and 20, arranged beneath the arms 22 and 23, pintles carried by said plates, a window-sash provided with recesses adapted to receive the pintles, and a detachable frame arranged at the opposite side of the sash, substantially as described.

6. The combination, with a sash arranged for pivotal connection with the case, of a frame B, provided with flanged plates 32, that are adapted to enter undercut recesses formed in the window-case, substantially as described.

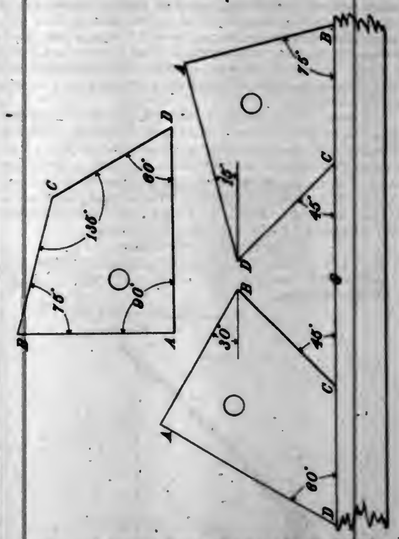


7. The combination, with a sash arranged for pivotal connection with the case, of a frame B, provided with flanged plates 32, that are adapted to enter undercut recesses formed in the window-case, and a spring-tongue connected to the frame and arranged to engage a flanged plate, substantially as described.

8. In a window, the combination, with a frame provided with a recessed parting-strip 11 and a recessed guiding-strip 13, of a shaft mounted in a recess formed in the window-frame, arms 22 and 23, carried by said shaft, pintles carried by the arms, said arms being arranged to enter the recesses in the guiding and parting strips, respectively, folding supports carrying pintles arranged below shaft and arms, and a window-sash having recesses upon its upper and lower sides adapted to receive the pintles of the upper and lower supporting-arms, substantially as shown and described.

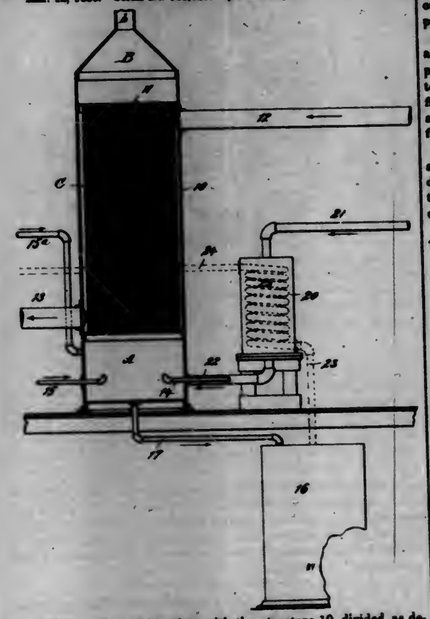
9. In a window, the combination, with a frame, of the pintles 19^a and 20^a, mounted within the runways, of the lower and upper sashes, respectively, the arms 19 and 20, hinged to the plates 19^a and 20^a and carrying the pintles 8 and 9, the spring 7, supporting-arms having pintles arranged above the arms 19 and 20, and a window-sash having recesses upon its upper and lower sides adapted to receive the pintles of the upper and lower supporting-arms, substantially as and for the purpose described.

411,616. DRILLING-MACHINE. WINFIELD S. ROGERS, Cincinnati, Ohio, assignor to the Universal Radial Drill Company, same place. Filed Mar. 22, 1889. Serial No. 304,230. (No model.)



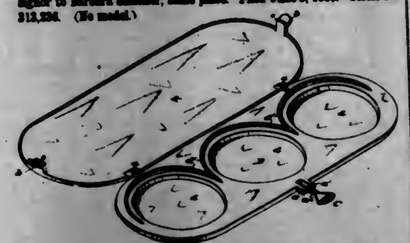
Claim.—1. In a drilling-machine, the combination, substantially as set forth, of a vertical column, a table-arm pivoted thereto near the base and capable of a swinging motion with reference to the column, a table carried by the outer end of said table-arm, an arm-saddle fitted for vertical adjustment upon said column, a radial arm carried by said saddle upon a vertical pivot, and a spindle-bearing fitted for horizontal adjustment upon said radial arm.

2. In a drilling-machine, the combination, substantially as set forth, of a column, a table-arm carrying a table and fitted for swinging motion near the base of the column, an arm-saddle fitted for vertical adjustment upon said column, a radial arm pivoted to said saddle and carrying a horizontally-adjustable spindle-bearing, clamps for fixing the saddle in adjusted position with reference to the column, and a clamp for fixing the radial arm in adjusted angular position with reference to the arm-saddle.



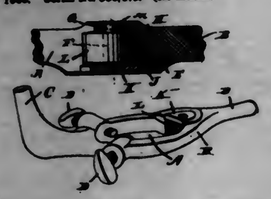
3. In a drilling-machine, the combination, substantially as set forth, of a drill-spindle G, having a central longitudinal bore and having a taper socket M in its lower end communicating with said bore, vertical shaft N, engaging the central bore of the spindle, and stud O on the lower end of said shaft, adapted to engage the shank of the drill which may be disposed in said drill-socket.

411,617. DRAWING-INSTRUMENT. LUIGI F. RONDINELLA, Philadelphia, Pa. Filed Apr. 16, 1889. Serial No. 307,492. (No model.)



Claim.—An improved drawing-instrument for plotting and measuring angles, which consists of a plane quadrilateral piece of wood or other suitable material, the sides of which form the angles of seventy-five degrees, ninety degrees, sixty degrees, and one hundred and thirty-five degrees, respectively, the angles of seventy-five degrees and sixty degrees being adjacent to the right angle, while the angle of one hundred and thirty-five degrees is opposite to the right angle.

411,618. BLAST-HEATER. JOHN SEABLOM, Ironton, Mich. Filed Mar. 12, 1889. Serial No. 303,023. (No model.)

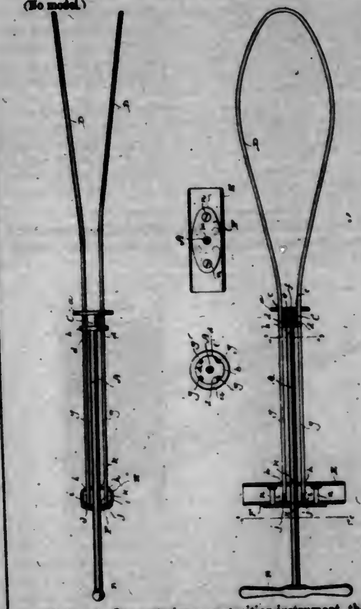


Claim.—The combination, with the structure 10, divided as described, of tubes 11, arranged within said structure, pipes 12, 13, 14, and 15, leading to the structure, a tank 16, connections between the tank and the structure, a drum 20, a coil-pipe arranged within the drum, connections between said coil-pipe and the tank, a pipe connected with the coil-pipe and arranged for connection with a pump, an exhaust-steam pipe connected to the drum, and a pipe connecting the drum and the structure, substantially as described.

411,619. CAKE-GRIDDLE. MILTON SHAWVER, Canton, Ohio, assignor to Barbara Shaeffer, same place. Filed June 5, 1889. Serial No. 312,936. (No model.)

Claim.—The combination of the hinged sections A and B, the section A provided with the handles *b* and the studs *c*, the section B provided with the cake-cups *d* and the guide-flanges *d'*, substantially as and for the purpose specified.

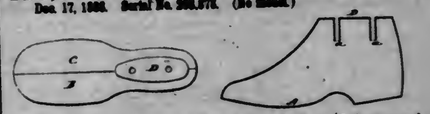
411,620. LATHE-DOG. CHARLES W. SHARTLE, Middletown, Ohio. Filed Apr. 8, 1889. Serial No. 306,475. (No model.)



Claim.—1. In a lathe-dog, the combination, substantially as set forth, of a stock having one or more driving-tails and an eye, a pair of convergent set-screws, and a jaw pivoted in the wall of the eye and presenting a serrated face into said eye opposite to the set-screws.

2. In a lathe-dog, the combination, substantially as set forth, of a stock provided with one or more driving-tails and with an eye, a pair of convergent set-screws, a recess in the wall of the eye opening toward one face of the dog, a cover-recess at the open face of said first-mentioned recess, a removable cover-plate fitting said recess, and a jaw pivoted in said first-mentioned recess and presenting a serrated face in the eye of the dog opposite to said set-screws.

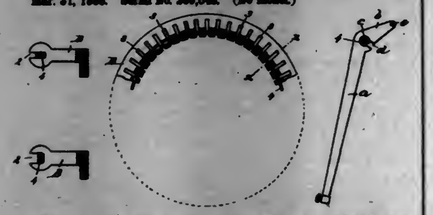
3. In a lathe-dog, the combination, substantially as set forth, of a stock provided with an eye and with two oppositely-projecting radial driving-tails, one of which tails is bent at right angles to the face of the dog, and one or more set-screws inserted through the wall of the eye of the stock and projecting into said eye.



411,621. VETERINARY PARTURITION-INSTRUMENT. ARTHUR P. SHEARDUR, Mendota, Ill. Filed June 12, 1889. Serial No. 313,972. (No model.)

Claim.—1. In a veterinary parturition-instrument, the combination of two opposing and normally divergent extricating-loops with an apertured guide-block moving on the ends of said loops, a cross-piece secured to the said loop ends, and an operating-rod passing through said cross-piece and secured to said guide-block, substantially as set forth.

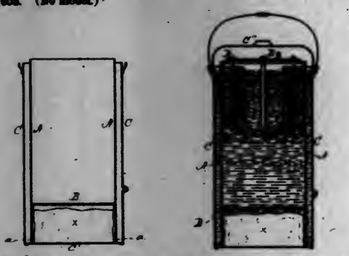
2. In a veterinary parturition-instrument, the combination of two opposing and normally divergent extricating-loops terminating in straight parallel ends apset at their extreme portions, a cross-piece transversely perforated for the passage therethrough of said ends, a removable retaining-plate secured to said cross-piece, an apertured guide-block moving on the said ends between the said loops and said cross-piece, and an operating-rod passing through said cross-piece and retaining-plate and secured to said guide-block, substantially as set forth.



411,622. LAST. EDWARD S. SMITH, Waterbury, Conn. Filed Dec. 17, 1888. Serial No. 293,672. (No model.)

Claim.—A last constructed from several pieces of sheet metal formed into the required shape and so that the edges correspond to the edges of the adjacent parts, and the said parts united by butt-

joints or seams welded or brazed together to form a complete sheet-metal last, substantially as described.

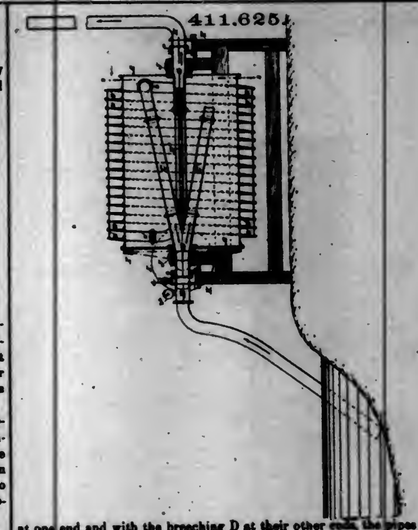


411,623. TYPE-WRITING MACHINE. ANDREW W. STREET, New York, N. Y., assignor to the Yost Writing Machine Company. Filed Mar. 31, 1888. Serial No. 269,048. (No model.)

Claim.—1. In a type-writing machine, the combination of a type-ring provided with a horizontal groove and internal vertical slots radiating from the center of said ring, a fulcrum-ring or pivotal support within said groove, and type carriers or levers having each an eye or bearing and a lateral slot or passage-way leading thereto from the exterior of the lever, substantially as set forth.

2. In a type-writing machine, the combination of a type-ring provided with a groove and internal vertical slots radiating from the center of said ring, a fulcrum-ring or pivotal support within said groove and having two flat sides, and type carriers or levers having each an eye or circular bearing and a lateral slot or passage-way leading thereto of less width than the diameter of the eye or circular bearing, substantially as set forth.

411,624. PROCESS OF REMOVING BUTTERMILK FROM BUTTER. ALBERT F. TRAYER, Maple Hill, Kans. Filed May 4, 1888. Serial No. 273,033. (No model.)

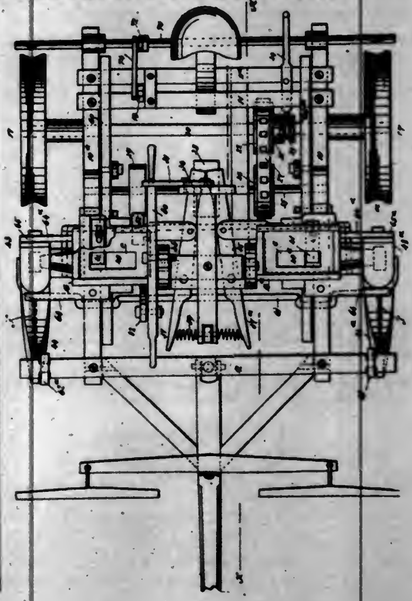


Claim.—The process of separating buttermilk from butter, which consists in first melting butter under sufficiently warm water by holding said butter in bulk below the surface thereof, next allowing the butter to rise in a melted state through the water, whereby the buttermilk is absorbed thereby, and then beating the pure butter which has risen to the surface into a frothy substance, and finally allowing the said substance to cool, whereby it becomes non-granular and solid, substantially as set forth.

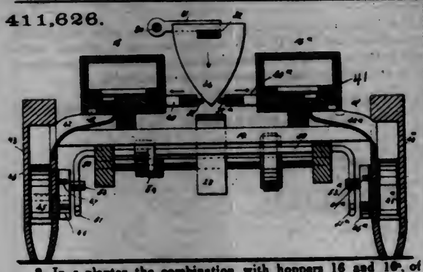
411,625. PUMP. ALBERT THIERY, Paris, France. Filed Oct. 19, 1887. Serial No. 252,853. (No model.) Patented in France Oct. 21, 1884, No. 164,908, and in Belgium Apr. 20, 1885, No. 66,562.

Claim.—1. In a lift and force pump, the combination, with the like helical channels mounted rotatively on a common axis, of pipes connecting the receiving ends of said channels with the induction pipe or inlet of the pump, the said induction-pipe provided with an air-inlet *d*, the pipes connecting the delivery ends of the said helical channels with the eduction-pipe of the pump, and the said eduction-pipe, substantially as described and set forth.

2. In a pump, the combination, with the like helical or spirally-arranged channels B B', mounted rotatively on their common axis and having tubular journals on which they rotate, of the pipes C and C', connected, respectively, with the terminals *b* and *b'* of said channels



411,625.



at one end and with the breeching D at their other ends, the pipes F and F' connected at one end with the terminals *e* and *e'* of said channels and at their other ends with the breeching G, the said breechings D and G, and the air-inlet at the induction end of the pump, the pipes C C' and F F' being arranged within the drum-like coils formed by said channels B B', as set forth.

411,626. PLANTER. ARNE S. TRAGESTOL, Brookfield, Iowa. Filed Apr. 26, 1889. Serial No. 308,708. (No model.)

Claim.—1. In a planter, the combination, with a main frame, of the combined furrow-openers and feed-delivery chutes, the double crank-shafts connecting the furrow-openers, levers for operating said crank-shaft, links connecting the crank-shaft and levers, and the slotted guides attached to the forward end of the furrow-openers and to the main frame, substantially as shown and described.

411,626.

2. In a planter, the combination, with hoppers 16 and 16', of slides 40 and 40' and blocks 41, adjustably mounted in recesses formed in the slides, the levers 37 and 37', pivotally connected with the slides 40 and 40', respectively, a double spring 39, carried between the forward ends of said levers, the double cam-faced block 36, and the lever 32, for carrying and operating said block, all arranged and adapted to operate substantially as shown and described.

3. In a planter, the combination, with an axle, of a shaft arranged in advance thereof, chain-wheels carried by the axle and shaft, a chain arranged in connection with such wheels, a cam-faced block 26, a weighted lever 30, a link 33, a lever 32, a wedging-block 36, levers 37 and 37', and slides 40 and 40', all substantially as described.

4. In a planter, the combination, with the shaft 25 and a means for driving the same, of cam-faced blocks 28 and 29, carried by the shaft, a lever 30, a wedging-block 36, connections between the lever 30 and the wedging-block, seed-boxes, slides arranged in connection therewith, levers 37 and 37', to which the slides are connected and upon which the wedging-block 36 acts, furrow-openers, seed-delivery chutes arranged to the rear thereof, tilting plates arranged in the seed-delivery chutes, a shaft 50, having forwardly-extending arms which bear upon projections carried by the tilting plates, and a projection which is borne upon by the cam-faced block 29, substantially as described.

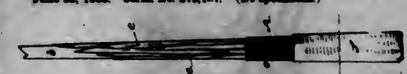
5. In a planter, the combination, with the chutes 43 and 43', of the tilting plates 45 and 45', mounted, respectively, within the same, the blocks 46 and 46', connected to the pivotal supports of said blocks and adapted to rest against the stop or limit pins 47 and 47', a shaft 50, having downwardly-extending projections 51 and 51' and carrying a block 52, which extends in the path of the cam 29, all arranged and adapted to operate substantially as shown and described.

6. In a planter, the combination, with the main frame, of the seed-hoppers 16 and 16', mounted thereon, the slides 40 and 40', reciprocating therein, the levers 37 and 37', pivotally connected to said slides and having the double spring 39 between the forward ends of said levers, the double cam-faced block 36, for operating said levers, the upright standard 35, mounted upon the main frame, the lever 30, pivoted thereto, the cross-bar 31, connecting the lever and cam-faced block, the connecting-rod 32 and link 33, extending to a crank-arm 34, and the shaft 50, connected with the delivery-chutes 43 43', substantially as described, and for the purpose set forth.

411,627. FOWL OR STOCK FEEDER. BENJAMIN WALTON, Compton, Cal. Filed Feb. 19, 1889. Serial No. 300,466. (No model.)

Claim.—1. The combination of the upright end pieces A A, the trough E, the trough C, arranged between the vertical end pieces above the trough E, and covers secured over the said troughs at a sufficient height to give access beneath them to their respective troughs, substantially as set forth.

2. The combination of the upright end pieces A A, the trough E, the trough C, arranged between the vertical end pieces above the trough E, and the longitudinally-slotted covers B and F, substantially as set forth.



3. The combination of the upright end pieces A A, the trough E, the trough C, arranged above the trough E, and the longitudinally-slotted hinged covers secured above the said troughs, substantially as set forth.

4. The combination of the upright end pieces A A, the troughs E and C, secured between said vertical pieces, and longitudinally-slotted covers arranged above said troughs and provided with the longitudinal hoppers, substantially as set forth.

5. The combination of end pieces, a trough arranged between said end pieces, the slotted cover, and the adjustable side bars, substantially as set forth.

6. The combination of end pieces, the trough, the slotted hinged cover, and the floor-boards, substantially as set forth.

411,628. WHIP. EDWARD E. WARREN, Three Oaks, Mich. Filed June 26, 1888. Serial No. 278,187. (No specimens.)

Claim.—1. As an improved article of manufacture, a whip having a tapering core and an external layer of bone formed of thin flat splints of bone bound flatwise longitudinally upon said previously-formed core with their longitudinal edges overlapped and arranged to break joint, and a binding material around the exterior of the layer of bone, substantially as set forth.

2. In a whip, the tapering resilient core provided with a covering composed of separate and independent thin flat splints and small fibers *c c'* of bone, arranged to break joint, as described, and bound upon the core throughout its length.

3. As an improved article of manufacture, a whip consisting in a resilient core of less length than the whip, a series of separate and independent flat splints *c* of bone, bound upon the core throughout its length, arranged to break joint, and extended beyond the end of the core and there bound together to form the tip B, and the outer lining inclosing the whole, substantially as set forth.

411,629. ARMATURE. CHARLES F. WINSLOW, Hoosick Falls, N. Y. Filed Jan. 26, 1889. Serial No. 297,660. (No model.)

Claim.—1. As armature for dynamo-electric machines or motors, the coils or sections being formed of flat strips of metal wound on edge, and the ends of said coils or sections being bent over toward or against the heads of the armature, substantially as described.

2. As armature for dynamo-electric machines or motors made up of a series of coils or sections which lay over or cross each other at the ends or heads of the armature, the said coils consisting of flat metal strips wound on edge and having their ends, which cross each other, bent over laterally against the heads or ends of the armature to shorten their diameter, for the purpose described.

3. A Siemens armature for dynamo-electric machines or motors, whose winding consists of flat metal strips wound on edge, that portion of the winding which passes over the heads or ends of the armature being turned over or bent flat against said ends, for the purpose described.

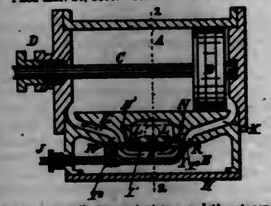
411,630. CABLE-GRIPPER. HERBERT M. WRIGHT, San Francisco, Cal. Filed June 21, 1888. Serial No. 315,127. (No model.)

Claim.—1. A cable-grip, substantially as described, comprising the main frame, the grip-frame supported and movable in said main frame, the upper jaw supported on and movable with and independently of said grip-frame, the main lever supported on the grip-frame and connected with and arranged to operate the upper jaw, and the grip-frame lever supported on the main frame and connected with the grip-frame, whereby to operate the same, all substantially as set forth.

2. In a cable-grip, the combination, with the main frame, of the grip-frame supported and movable in said main frame, the upper jaw supported on and movable with and independently of the grip-frame, and the main lever supported on the grip-frame and connected with and arranged to operate the upper jaw, whereby said jaw may be adjusted or moved independently of the grip-frame, substantially as set forth.

3. The combination, in a cable-grip, with the grip-frame movably supported, of the upper jaw, arms or links connecting said upper jaw with the grip-frame, and the main lever pivoted to the grip-frame and arranged to move or operate the said upper jaw, whereby the

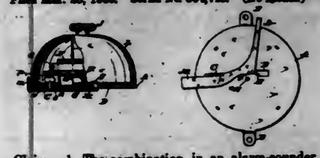
said jaw may be moved independently of the movements of the grip-frame, substantially as set forth.



4. In a cable-grip, substantially as described, the combination of the grip-frame, the upper jaw, and the links or arms pivoted at their upper ends to the grip-frame and at their lower ends to the said jaw and movable or swinging in advance and rear of a line dropped from their upper pivots, all substantially as described, whereby the said jaw may be swung to move vertically and in the direction of its length, whereby the grip will be self-tightening, substantially as set forth.

5. In a cable-grip, substantially as described, the combination of a curved rack formed of two side sections, such sections having teeth and the teeth of one section facing in opposite direction to those of the other section, the lever extended between said sections, and the pawls supported on said lever and arranged to engage the sections of the rack, such pawls having a portion fitting between the sections and a lateral portion to engage the same, substantially as set forth.

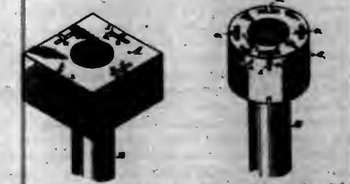
6. The improved cable-grip, substantially as described, consisting of the main frame having a curved rack and provided with the fixed jaw, the grip-frame movable within said main frame and having a curved rack, the movable or upper jaw supported by said grip-frame and carried by swinging links or arms, and the main and grip-frame levers provided with pawls, substantially as set forth.



7. In a cable-grip, the combination of the main frame, the grip-frame movable in the main frame and having a shoulder or bearing *i*, the grip-frame lever pivoted to the main frame having a cam by which to engage and depress the grip-frame, and the link I, connected with the said lever and having a portion engaging under the shoulder or bearing *i*, substantially as set forth.

411,631. STEAM-HEATING APPARATUS. JOHN AGATE, Pittsford, N. Y. Filed Mar. 27, 1889. Serial No. 304,969. (No model.)

Claim.—The steam-cylinder and piston and the steam-chest provided with passages K K' and with the supplementary exhaust-ports N N', located between said passages, and the exhaust-ports L L', the slide-valve I, having passage S and solid face parts F F', each face F' having a width greater than that of port E or E' and equal to or a little wider than that of the ports N L or N' L', and the face F being equal to the distance between the ports N N', whereby the valve is adapted to cover all said passages and ports during the admission of steam to the cylinder, and then upon suitable movement to uncover first a supplementary port, and then to cover the same and uncover an exhaust-port L or L', all in combination with a radiator and a pipe having a check-valve communicating with said supplementary ports and with the radiator, substantially as set forth.

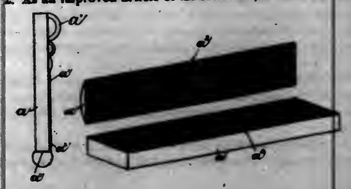


411,632. BURGLAR-ALARM. GEORGE ABEEL, Cleveland, Ohio. Filed Mar. 26, 1888. Serial No. 304,712. (No model.)

Claim.—1. The combination, in an alarm-sounder, of the plate A, a bolt M, loosely secured thereto, having its ends *m* and N projected outside of the diameter of said plate, its front end adapted to rest against an opposing object, the rear end portion N to form a handle by which said portion of the bolt may be thrown into or out of engagement with the retaining-shoulder E, and a spring to throw the bolt longitudinally and transversely and to hold it out of engagement with the movement and the shoulder, substantially as described, and for the purpose set forth.

2. The combination, in an alarm, of the plate A, having a perforation C on one side of its central portion and a perforation D on the other side, diametrically opposite, or thereabout, the latter having a retaining-shoulder E, and a bolt M, having its ends *m* and N projected outside of the diameter of the plate A, said bolt adapted at its front portion for a longitudinal movement and at its rear portion for longitudinal and transverse movement, projected portions *o* to engage the movement, and portion *g* to engage the shoulder E to hold the portion *o* in engagement with the movement, substantially as described, and for the purpose set forth.

411,633. HAMMER. LORENZO D. RALFOUR, Carthage, Mo. Filed Feb. 23, 1889. Serial No. 300,992. (No model.)

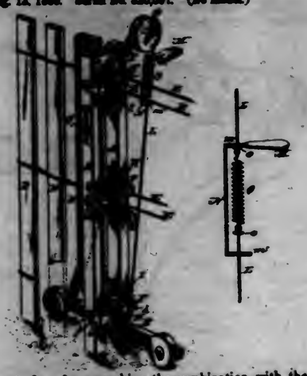


Claim.—1. The combination, substantially as hereinbefore set forth, of the handle and the hammer-head secured to the end of the handle and formed with T-shaped recesses consisting of parts 1 and 2 to hold a tack or nail, the part 1 of said recess being adapted to receive the head of the tack or nail and the part 2 to receive the shank near the head, some of said recesses being formed with the part 1 in the top of the hammer-head and one or more of said recesses being formed with the part 1 in the side of the hammer-head, whereby tacks or nails may be held for insertion both vertically and horizontally.

2. The combination, substantially as hereinbefore set forth, of the hammer-handle, and the square hammer-head secured to the end of the handle and having T-shaped recesses formed in the upper edge to hold tacks, nails, or similar attaching devices both vertically and horizontally.

411,634. VENEER. ELLIOTT H. RALSFORDE, Whitefield, Mass., assignor of one-half to Samuel Abbott, same place. Filed Dec. 27, 1887. Renewed Jan. 30, 1889. Serial No. 297,903. (No specimens.)

Claim.—1. As an improved article of manufacture, a veneered body consisting of a body or surface and a veneer *a'* of cane, substantially as described, provided with corrugations and secured to the said body by adhesive material, substantially as described.



2. As an improved article of manufacture, a veneered body consisting of a body *a* provided with corrugations a^3, and a veneer *a'* of bamboo provided with corrugations a^3 and secured to the body *a* by glue, substantially as described.

411,684.

411,685. FENCE-MACHINE. WILLIAM S. BARKER, Troy, Ohio. Filed Aug. 13, 1889. Serial No. 320,697. (No model.)

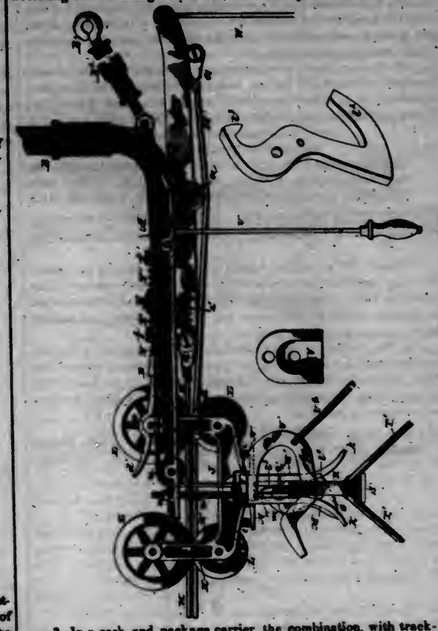
Claim.—1. In a fence-machine, the combination, with the twisters and a wire band connected therewith for operating the same, of a handle through which said band passes and a spring connecting the ends of the band and engaged by the handle, substantially as shown and described.

2. In a fence-machine, the combination, with the twisters and the wire band connected therewith for operating the same simultaneously, of the bar provided with a handle and having lateral arms through which the wire band passes, and a spring connecting the ends of the wire between said arms, as set forth.

3. The combination, with the brackets having grooves upon their adjacent faces, of the twister-wheel provided with lateral lugs working in said grooves, substantially as described.

4. The combination, with the brackets having grooves in their adjacent faces, one of said brackets being adjustable, of the twister-wheel provided with lateral lugs, substantially as shown and described.

5. The combination, with the brackets having grooves upon their adjacent faces, of the twister-wheel having lateral lugs engaging said grooves and inwardly-projecting lugs having openings for the passage of the fence-wires, substantially as described.



6. The combination, with the brackets composed of a rim and securing-arms with circular grooves in the adjacent faces of the rims, of the twister-wheel consisting of a ring having projecting therefrom laterally lugs having beveled ends working in said grooves, and lugs projecting toward the center of the ring and provided with openings for the passage of the fence-wires, substantially as shown and described.

7. The combination, with the twister-wheel provided with peripheral groove and having depression within said groove, of the wire arranged in said groove, and the thumb-screw passed through the rim of the wheel and having a hooked end engaging the wire and binding it in said depression, as shown and described.

411,636. CASH AND PACKAGE CARRIER. SAMUEL W. BARR, HENRY M. WEAVER, and JACOB H. BARR, Mansfield, Ohio. Filed Nov. 23, 1888. Serial No. 291,570. (No model.)

Claim.—1. In a cash and package carrier, the combination, with track-wires, of a carrier with wheels adapted to travel on such wires, mechanism for spreading the wires to actuate the carrier, and a longitudinally-movable spring-cushioned locking device connected with said mechanism for holding the carrier, substantially as set forth.

2. In a cash and package carrier, the combination, with track-wires, and a carrier with wheels adapted to travel on such track-wires, of mechanism for spreading the wires to actuate the carrier, a longitudinally-movable spring-cushioned locking device connected with said mechanism for holding the carrier, and means for simultaneously liberating and actuating the carrier, substantially as set forth.

3. In a cash and package carrier, the combination, with track-wires and a carrier adapted to ride thereon, of a swinging lever to which the ends of the wires are fastened, a latch-fork having sliding contact with the lever, and springs for cushioning said fork in each direction, substantially as set forth.

4. In a cash and package carrier, the combination, with track-wires and a carrier adapted to ride thereon, of a swinging lever to which the ends of the wires are pivotally secured, and a fork having sliding contact with the lever, said fork having recesses in its tines to receive and hold the carrier, a guide-block on its stem, said block having legs straddling the lever, and springs mounted on the stem on each side of the guide-block, substantially as set forth.

5. In a cash and package carrier, a frame having a double hook both members of which are located in positions to be engaged by the basket-ball, one member being adapted to support the basket, while the other member operates when engaged by the ball to move the basket-supporting member from under the basket-carrying ball.

6. In a cash and package carrier, the combination, with a frame and basket elevating and lowering devices, of a double hook attached to the carrier, both members of the hook being in positions to be engaged by the basket-ball, one member being adapted to support the basket, while the other member when engaged by the ball operates to move the basket-supporting member from under the basket-carrying ball, substantially as set forth.

7. In a cash and package carrier, the combination, with a frame-piece having wheels journaled therein, a pair of integral jaws pivoted to the said frame-piece, and springs interposed between the jaws and frame-piece, of a double hook pivoted in one of said jaws, substantially as set forth.

8. In a cash and package carrier, the combination, with a frame-piece having wheels journaled therein, of a pair of integral slotted jaws pivoted to the frame-piece, said jaws having outwardly-spreading lips and integral ribs, springs interposed between the jaws and frame-piece, and a double latch-hook pivoted to one jaw and adapted to swing in the slot, substantially as set forth.

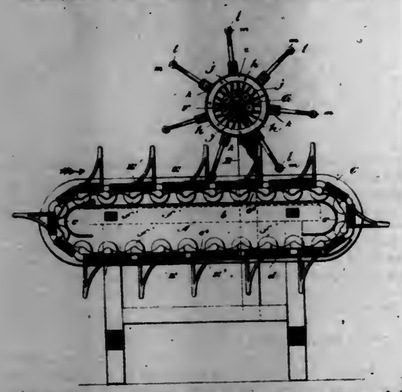
9. In a cash and package carrier, the combination, with a carrier having a pair of jaws pivoted thereto, and a double latch-hook pivoted in one of said jaws, of a basket and basket-holder, said holder having a trip or staple thereon adapted to engage the upper member of the double hook, substantially as and for the purpose set forth.

10. In a cash and package carrier, the combination, with a car-

rier having a pair of integral jaws pivoted thereto, and a double latch-hook pivoted to one of the jaws, of a basket having bails and holder, the latter having a trip or bail thereon, and a rounded face for operating the double latch-hook, substantially as set forth.

11. In a cash and package carrier, the combination, with a carrier-frame and devices for supporting a basket, of adjustable blocks, and hooks located below the adjustable blocks for elevating the basket to the basket-supporting devices.

12. In a cash and package carrier, the combination, with a frame mounted on wheels and having basket-supporting devices depending therefrom, of a split foot, a block adjustably secured thereto, and hooks located below the blocks, substantially as set forth.



411,637. METHOD OF SPLICING WIRE ROPES. TELFORD C. BATCHELOR, West Kensington, County of Middlesex, and ARTHUR LATCH, South Shields, County of Durham, England. Filed Apr. 3, 1888. Serial No. 269,508. (No model.) Patented in England Dec. 3, 1887, No. 16,675.

Claim.—1. The method herein described of splicing the ends of wire rope comprising numerous wires spirally twisted together, which consists in forming the ends of the rope with corresponding recesses and projections, fitting the projections and recesses together, and welding the wires, substantially as set forth.

2. The method herein described of splicing the ends of wire rope, which consists in cutting away or removing portions of some of the wires at the ends of the rope to form corresponding projections and recesses, fitting the projections into the recesses, and welding the wires, substantially as described.

411,638. TILE OR BRICK CUTTING TABLE. JACOB BEHRING, Malinta, Ohio. Filed July 11, 1889. Serial No. 317,165. (No model.)

Claim.—1. The combination, with the supporting-frame, of the endless carrier composed of hinged connecting-blocks having spaces, as described, separated, and a rotating device having a series of radial cutter-frames provided with cutters adapted to register with said spaces, substantially as set forth.

2. The combination, with the supporting-frame carrying the horizontal flanged portions at each side, of an endless carrier consisting of hinged blocks and having spaces, as described, rollers journaled on said blocks to engage said flanges, and a revoluble device provided with a series of cutter-frames, each having a cutter adapted to register with the spaces between the blocks, substantially as set forth.

3. The combination, with the supporting-frame and revoluble device having the radial cutter-frames, of an endless carrier composed of a series of blocks E E', the blocks E having castings secured to their under sides and provided with journals, the blocks E' provided with castings on their under sides and perforated to engage said journals to form a hinged connection, substantially as set forth.

4. The combination, with the supporting-frame having the side flanges and revoluble device carrying the radial cutter-frames, of an endless carrier composed of a series of blocks E E', the blocks E having castings secured to their under sides and provided with journals, the blocks E' having castings secured to their under sides and perforated to engage said journal, and rollers mounted on the projecting ends of the latter to engage said flanges, substantially as set forth.

5. The combination, with a supporting-frame, of the revoluble device having the radial cutter-frame, and an endless carrier consisting of hinged blocks, every alternate block being provided on its upper side, at each end, with a vertical casting, substantially as set forth.

6. The combination, with the supporting-frame and endless carrier, of a yoke-shaped cutter-frame provided with oppositely-located hooks, and a wire secured to the frame at one side engaging said hooks and connected at its other end to an adjustable thumb-screw, substantially as set forth.

7. The combination, with the supporting-frame and endless carrier, of a transverse shaft, a disk mounted thereon and provided with horizontal marginal lugs and a series of inner perforations, a series of sockets bearing between said lugs and secured by a bolt engaging one of said perforations, and cutter-frame connected to said sockets, substantially as set forth.

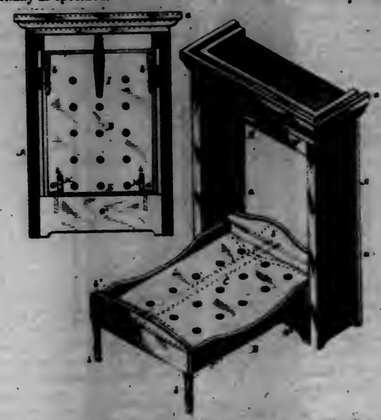
8. The combination, with a supporting-frame and endless carrier, of the disk and socket secured thereto, and cutter-frames, each comprising independent sections having inner tongues embracing and bolted to said sockets, substantially as set forth.

411,639. REIN-HOLDER. THOMAS H. BOLLA, Washington, D. C. Filed June 7, 1889. Serial No. 313,465. (No model.)

Claim.—1. A rein-buckle having a portion of one of its side bars cut away and having a pintle projecting from the inner portion of the opposite side bar, and a double tongue or clamp pivoted to said pintle and adapted to be turned at right angles to the frame to admit the reins, and returned to the same plane as the buckle-frame to hold the reins at two points, substantially as specified.

2. The combination of leather A and buckle B, attached thereto at one end and having a tongue *d'*, swiveled therein, and the ring or locking device C, attached at the other end of the leather, all substantially as and for the purposes set forth.

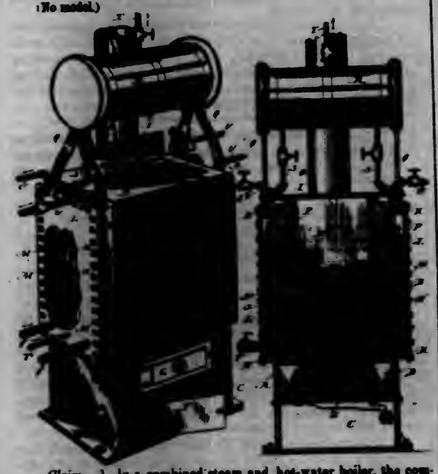
3. A rein-buckle having a portion of one of its side bars cut away and having a pintle projecting from the inner portion of the opposite side bar, and a double tongue or clamp pivoted to said pintle, and combined with means for attaching it to a vehicle, substantially as specified.



411,640. INSECT-SCREEN. JOHN W. BOUGHTON, Philadelphia, Pa. Filed Aug. 30, 1888. Serial No. 284,126. (No model.)

Claim.—An insect-screen consisting of frames with netting thereon and having longitudinal grooves extending obliquely in reverse directions in the contiguous faces of their top and lower bars, additional grooves communicating with said obliquely-extending grooves, and angular-shaped tongues having angular lips at their outer ends and provided with an ear connected to the side of one of the bars and extending at a right angle thereto, said parts being combined substantially as described.

411,641. WARDROBE-BEDSTEAD. HENRY C. BROWN, North Springfield, Mo. Filed Feb. 28, 1887. Serial No. 228,904. (No model.)



Claim.—1. In a wardrobe-bedstead, the combination, with the frame or casing A, provided with the lower front rail a^4 and the bottom supporting-rail a^7, the eye-straps D, secured to the rail a^7, the rod E, having bearings in the eyes of said straps, and the rollers G, mounted on said rod to the outer sides of said straps, of the bedstead B, moving upon the rollers G and capable of being turned up till it rests vertically upon the supporting-rail a^7 within the lower front rail a^4, substantially as specified.

2. In a wardrobe-bedstead, the combination, with the frame A, having the supporting-rail a^7 and the lower front rail a^4, the eye-straps D, secured to the inner surface of the rail a^7, the rod E, having bearings in the eyes of said straps, and the rollers G, mounted on the rod E to the outer sides of the eye-straps, of the bedstead B and the guide and limiting straps H, secured to the bottom of the bedstead at suitable points to the inner sides of the eye-straps, and provided with the hooked ends A, to limit the motion of the bedstead on the rod E, substantially as specified.

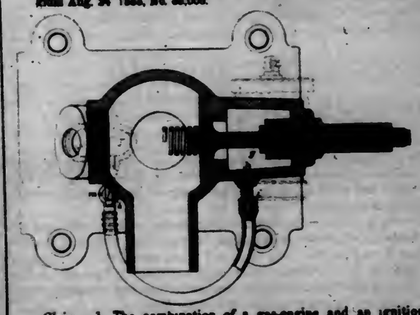
3. The combination, with the frame A, having the supporting-rail a^7 and lower front rail a^4, the eye-straps D, and the rod E, having bearings in the eyes of said straps, of the bedstead B, turning upon said rod till vertically within the frame A upon the rail a^7 and to the inner side of the rail a^4, the hinged folding head and foot boards *b' b²* respectively, and the elastic strap C, secured at its ends to the outer surface of the head-board near the lower edge thereof, and with its central part adapted to engage a button on the foot of the bedstead below the folding foot-board, substantially as specified.

411,642. COMBINED STEAM AND HOT-WATER BOILER. HORACE M. CHAPMAN, Chicago, Ill. Filed Mar. 11, 1889. Serial No. 302,861. (No model.)

Claim.—1. In a combined steam and hot-water boiler, the combination, with an internal vertical heating-chamber, a magazine located centrally therein, and external water-chambers, of a series of horizontal tubes passing through said heating-chamber at each side of the magazine and opening at their ends in said water-chambers, substantially as described.

2. In a combined steam and hot-water boiler, the combination, with a vertical internal heating-chamber, a magazine located centrally therein, and wings or plates on said magazine extending nearly to the walls of said chamber, and external water-chambers opposing said wings, of a series of horizontal tubes passing through the heating-chamber at each side of the magazine and opening into said water-chambers, substantially as described.

411,643. HOBBY-HORSE. JESSE A. CRANDALL, Brooklyn, N. Y. Filed Mar. 21, 1889. Serial No. 304,180. (No model.)



Claim.—1. The combination of the body, the straps pivoted thereto, the legs hung upon said straps, and the links connecting the straps of the front and rear legs at each side of the body, whereby the pair of legs on one side may be vibrated independently of the other pair and the springs controlling said straps, substantially as and for the purpose set forth.

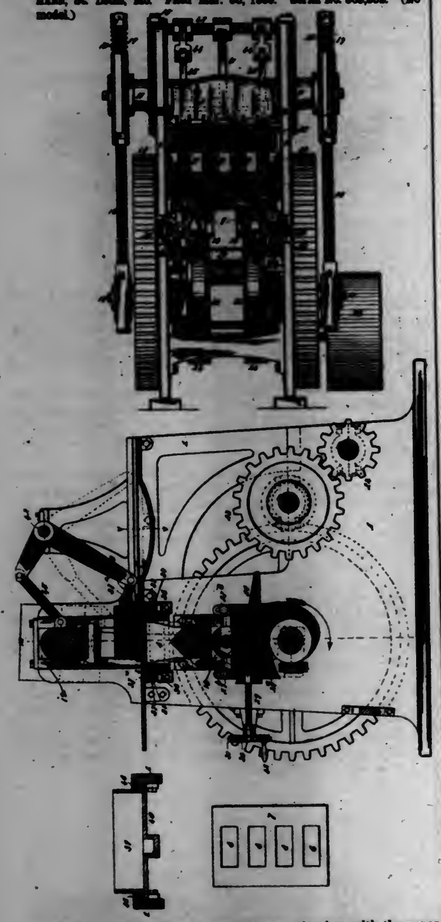
2. The combination of the body and the legs and ears secured to straps pivoted to the body, with the links connecting the straps of the legs and ears, whereby the legs and one ear at opposite sides of the body may be moved independently of the other legs and ear, substantially as specified.

3. The combination of the body, the straps connected to the opposite side pieces thereof, and the ears and legs mounted on said straps, and the tail pivoted on the body, with the connecting-links, whereby each set of straps on opposite sides of the body may be moved together and independently of the other set, substantially as and for the purpose described.

4. The combination of the base-frame, the spring-bars thereon, the seat and foot-rest mounted on said bars, with the animal figure having movable legs and mounted between said spring-bars, the shafts hung below the foot-rest and supported by said figure, the straps pivoted to the body and supporting the legs, the links connecting said straps, and the reins connected thereto for moving the limbs of the figure, all substantially as and for the purpose set forth.

411,644. STARTING-GEAR FOR GAS-ENGINES. BERNARD D. DESOUTTEVILLE and LÉON P. C. MALANDIN, Puteaux-le-Bourg, France. Filed Feb. 4, 1888. Serial No. 263,661. (No model.) Patented in France Jan. 16, 1888, No. 185,161; in Italy Feb. 18, 1888, No. 20,081; in England Feb. 24, 1888, No. 2,605; in Spain May 18, 1888, No. 7,946, and in Belgium Aug. 24 1888, No. 80,008.

Claim.—1. The combination of a gas-engine and an ignition-chamber with a connecting-pipe leading from the gas-supply to the ignition-chamber, the said pipe having a three-way cock, one way opening to an air-supply passage, as and for the purpose set forth.



2. The combination of a gas-engine and an ignition-chamber with a connecting-pipe having a three-way cock opening also to an air-supply passage, and an electric igniting device, substantially as described, and for the purpose specified.

3. The combination of a starting-gear for gas-engines, consisting of an ignition-chamber and a connecting-pipe having a three-way cock

with an electric igniting device, and a circuit-opener or switch in the circuit of the induction-coil, as and for the purposes specified.

4. A starting-gear for gas-engines, consisting of a three-way cock, air and gas supplies communicating therewith, an igniter, and a stop-cock between the ignitor and the cylinder, substantially as set forth.

411,645. RECIPROCATING BRICK-MACHINE. Otto I. Dieckmann, St. Louis, Mo. Filed Mar. 30, 1889. Serial No. 305,253. (No model.)

Claim.—1. In a brick-machine, the combination, with the upper and lower plungers, of a vertically-movable mold-box and springs upon which said mold-box is permanently and entirely supported, substantially as described.

2. In a brick-machine, the combination, with the plungers and means, substantially as described, for operating them, of the mold-box having the flanges 37ª arranged one at each of the four corners of said box, the perforated brackets, pins projecting from said flanges through said brackets, and springs surrounding said pins between said flanges and brackets, substantially as set forth.

3. In a brick-machine, the combination, with the upper and lower plungers, and the frame 1, having slots 12, carrying the upper cross-head bearing the plungers, and having extensions 11, working in said slots, of the journals 12ª, divided boxes in which said journals work, the rods 15, passing through said boxes and having nuts at their upper ends, springs bearing between said nuts and the upper divisions of said boxes, the pitmen 16, and the main shaft having cranks for operating said pitmen and cams for operating said lower plunger, substantially as set forth.

411,646. APPARATUS FOR PURIFYING AND REFINING OIL. Christian Doll and Emil Novtel, Philadelphia, Pa. Filed May 2, 1889. Serial No. 309,234. (No model.)

Claim.—1. An apparatus for refining and purifying oil, consisting of a tank, a receiving-reservoir in the upper part of said tank and provided with a discharge-pipe extending to near the bottom of the tank, a horizontal plate surrounding said discharge-pipe in said tank, depending cylinders secured to said plate, forming chambers communicating at alternate ends, a heating pipe within said chambers, said parts being combined substantially as described.

2. A tank with a reservoir therein, the latter having a discharge-pipe within the tank extending to near the bottom thereof, a horizontal plate with nozzles on its upper face and near its outer rim, depending concentric cylinders secured to said plate, forming communicating chambers, and heating-pipes within the inner one of said chambers, said parts being combined substantially as described.

3. An apparatus for refining and purifying oil, consisting of a tank having cocks at different heights thereon, a reservoir in the upper part of said tank having a discharge-pipe within the tank and extending to near the bottom thereof, a horizontal plate having nozzles near its rim, depending cylinders secured to said plate and forming chambers, said chambers having communication at alternate ends, a heating coil-pipe in the lower part of the tank and in the inner chamber, and a deflector on said horizontal plate, said parts being combined substantially as described.

4. In an apparatus for refining and purifying oil, a tank with suitable outlets, a reservoir with discharge-pipe in said tank, a horizontal plate with depending cylinders, forming communicating chambers, the outer one of said chambers having an upward outlet through openings in the horizontal plate, and a heating-pipe in said inner chamber, said parts being combined substantially as described.

411,647. GAS-HEATING BURNER. Albert J. Doty, Philadelphia, Pa., assignor, by mesne assignments, to the Goodwin Gas Stove and Motor Company, same place. Filed June 6, 1887. Serial No. 240,621. (No model.)

Claim.—1. In a gas-heating burner, the combination of the following parts, viz: the plate *f*, plate *j*, and arms *i*, cast in a single piece, the gas-chamber B, having orifices *e* in the vertical sides thereof, and mixing-tube C, having an air-opening *a*, also cast in a single piece, a fastening rivet or screw *g*, passing from the plate *f* to the chamber B and holding both castings together, and a gas-supply pipe D, having a gas-orifice *r* opening into said mixing-tube C, said parts being constructed and combined substantially as set forth.

2. In a gas-heating burner, the combination of a gas-supply pipe D, having a gas-orifice *r*, the mixing-tube C, having an air-opening *a*, the gas-chamber B, provided with orifices *e* in the vertical sides thereof, and the plate *f*, forming a top cover of the gas-chamber B and having radial arms *i*, supporting a surrounding annular plate *j*, so arranged with relation to said gas-chamber B as to form an air-passage between them, which shall supply air upwardly to the flame, said parts being constructed and combined substantially as described.

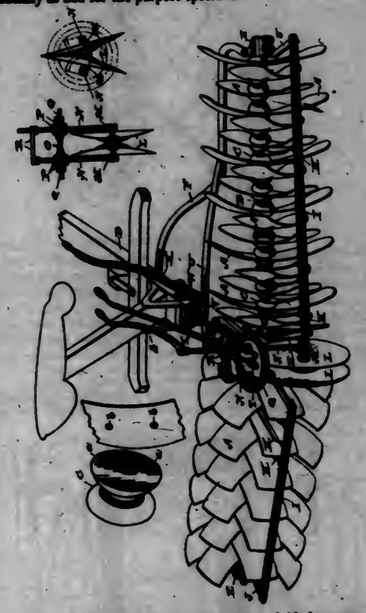
3. In a gas-heating burner, the combination of, the pipe D, having a gas-orifice *r*, mixing-tube C, provided with air-opening *a*, gas-chamber B, having orifices *e* in the vertical sides thereof, a plate *f*, having radial arms *i*, and an annular plate *j*, having perforations *p* and *g*, supplying air to the flame above the point of ignition, said parts being constructed, combined, and arranged substantially as set forth.

411,648. MULTIPLE HEATING GAS-BURNER. Albert J. Doty, Philadelphia, Pa., assignor, by mesne assignments, to the Goodwin Gas Stove and Motor Company, same place. Filed June 6, 1887. Serial No. 240,622. (No model.)

Claim.—1. A multiple gas-burner consisting of a central chamber B, having a series of hollow arms A radiating therefrom, provided at their ends with gas-jets, a gas-nozzle D, secured within said central chamber B, provided with separate gas jets or orifices *a*, delivering gas into each of said radial arms, said chamber B being perforated at its base with an annular or central aperture *c*, surrounding the gas-nozzle D, said parts being constructed, combined, and arranged substantially as set forth.

2. In a multiple gas-burner, the combination of the following parts, viz: a series of hollow arms A, cast in approximately semicircular form and integrally with the central chamber B, a base-plate for both of the same, consisting of the cross-shaped plate E, having an annular central air-aperture *c*, a central gas-nozzle D, provided with gas-orifices *a* and secured within said chamber B, and projecting downward through the center of the aperture *c* and communicating with the gas-supply pipe F, said parts being constructed, combined, and arranged substantially as set forth.

411,649. GAS-STOVE. Albert J. Doty, Philadelphia, Pa., assignor, by mesne assignments, to the Goodwin Gas Stove and Motor Company, same place. Filed June 6, 1887. Serial No. 240,623. (No model.)



Claim.—1. The combination and arrangement, with the burner F, of the following parts, viz: the concave deflecting-plate B, having a central opening arranged above said burner, a conical heat-distributing plate E, supported above the deflecting-plate B and provided on its upper surface with radial ribs *c*, a griddle D, secured to said plate E in such manner that the said radial ribs of the latter will contact with the under surface of the former, and a body or stand A, provided with an annular notched edge or rim extending vertically above the periphery of the plate B, supported within said body A, said parts being constructed, combined, and arranged as aforesaid in order that the flame may be directed outward through the draft-passage between the plates B and E and find its exit through the notched edges of the rim of the body A of the device, substantially as and for the purpose set forth.

2. The combination, with the griddle D and a burner F, of a concave plate E, located centrally above said burner F and provided with ribs *c*, contacting with the under surface of the griddle, and heat-insulating material *d*, applied to the central portion of the plate E, substantially as set forth.

3. The combination, with the griddle D, burner F, and supporting-frame A, of a deflecting-plate B, having a central opening C, located immediately over the burner F, a concave plate E, provided with radially-arranged ribs *c* on its upper surface contacting with the under surface of the griddle, and heat-insulating material *d*, applied to the central portion of the plate E, said parts being constructed, combined, and arranged substantially as set forth.

411,650. ROTARY FLOW. Joseph Draper, London, Ontario, Canada. Filed Dec. 24, 1888. Serial No. 294,455. (No model.)

Claim.—1. The combination, with a series of blades supported on a spindle, of ferrules fitted onto the spindle, one between each pair of blades, each ferrule having tents projecting from both of its ends designed to fit into holes or recesses formed in the surface of the blades, the tents on one end of each ferrule being set in such relation to the tents on its opposite end that the adjacent blades separated by the said ferrule shall be held at the proper angle to each other, so that their ends shall be substantially upon the line of an Archimedean screw, substantially as and for the purpose specified.

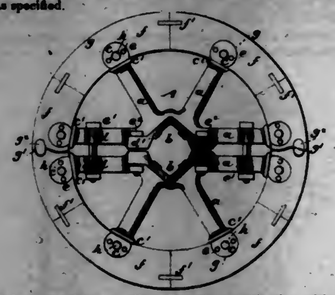
2. The combination, with a series of curved blades arranged as described, of a series of scrapers forked and supported at one end by the ferrule separating the blades and at their other ends adjustably connected to a horizontal bar suitably supported, as described, substantially as and for the purpose specified.

3. A frame and the spindles B and their blades, combined with the pair of concave-disk plows independently supported in proximity to each other between said spindles in such a manner that their outer edges may be angled, substantially as and for the purpose specified.

4. The disks L, independently journaled in proximity to each other and supported by the posts N, carried by the disk O, in combination with the toothed quadrants R and handle S, arranged substantially as and for the purpose specified.

5. The disk O, journaled in the bracket Q, and the posts N, connected to the disk O and arranged to support the disks L, substantially as and for the purpose specified.

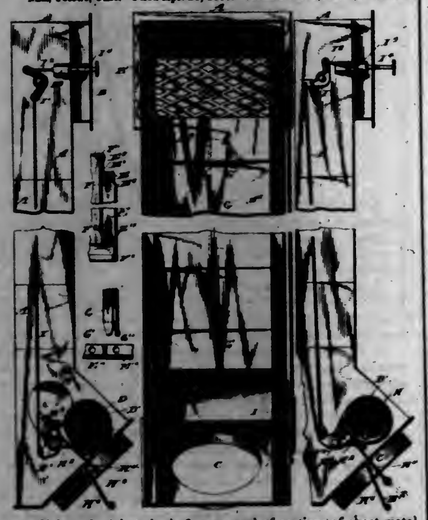
6. The plate U, arranged to extend over and rest upon the brace F and fixed to the bracket V, in combination with the lever X, pivoted to the tongue D and having a toothed quadrant formed on it to engage with the rack formed on the bracket V, substantially as and for the purpose specified.



7. The spindle B, having a cylindrical block Y formed upon or connected to it, in combination with a pivoted frame Z, having a hole in it around which an annular rib *e* is formed to fit into an annular recess *d* made in the block Y, substantially as and for the purpose specified.

8. The blocks Y, formed upon or connected to the inner ends of the spindles B and having their ends shaped so that they will butt against and engage with each other with the least possible friction, in combination with the frames Z, forming journal-boxes for the blocks Y and provided with pins *f* to fit into oblong holes *g* made in the bracket G, substantially as and for the purpose specified.

411,651. WOODEN-RIM SPLIT PULLEY. Gardner P. Rand, Racine, Wis. Filed Oct. 11, 1888. Serial No. 287,702. (No model.) Patented in Canada July 6, 1889, No. 29,455.



Claim.—1. In a wooden-rim split pulley, the rim having a central

drop flange or web and a spider the arms of which have shouldered plate portions embedded in the central flange or web, said plate portions being provided with integral pins or projections, combined with bolts passing entirely through the web and plate portions, substantially as specified.

2. In a wooden-rim split pulley, the combination, with the rim built up of successive ring portions, the central rims being deeper than the outer ones, whereby a central drop flange or web is formed in said rim, of a spider the arms of which have shouldered plate portions on their ends of a thickness equal to that of the central ring of the drop flange or web and into which they are embedded, said plate portions being also provided with integral pins or projections embedded in the rings on each side of the said central ring, and bolts passing through the plate portions and the web, substantially as specified.

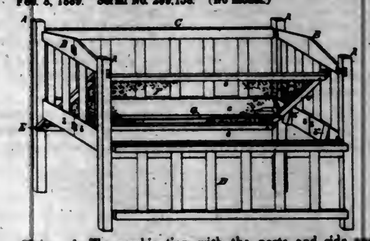
411,652. FURNACE-PIPE. ERNST A. EVERSMAN and DANIEL WAGNER, Toledo, Ohio. Filed Apr. 23, 1889. Serial No. 309,061. (No model.)

Claim.—1. A hot-air shaft composed of sections of sheet metal, said sections having inner and outer walls, having at their ends laterally-extending portions and extensions, the lateral portions being perforated to permit of communication between their respective outer passages between said walls, substantially as specified.

2. A hot-air shaft composed of sections of sheet-metal walls spaced to form an outer passage, said sections fitting into one another and at their ends bent to form oppositely-extending lateral portions and extensions, said lateral portions being perforated for communication of their respective outer passages, substantially as specified.

3. A sheet-metal section of a hot-air shaft, composed of inner walls having the right-angled bends, as described, one of said bent portions being perforated, in combination with outer walls having corresponding bends extending in the opposite direction, one of which bent portions is also perforated, the edges of said walls being turned over each other at the ends, substantially as specified.

4. A sheet-metal section for a hot-air shaft, composed of an outer wall bent and perforated, as specified, in combination with an inner wall formed in two parts, the vertical edges of said parts bent to form wings or ribs, as described, said walls separated to receive the tips of said wings or ribs, said inner wall being bent and perforated, as specified, and having its edges turned over those of said outer wall, substantially as specified.



5. A hot-air shaft having an inner and an outer wall constituting an inner and an outer passage, respectively, said outer passage communicating at the bottom thereof with the outer air by an aperture, and both passages having a common register, in combination with a valve for said aperture, a spring tending to open said valve, a bell-crank pivoted near said register, and means for connecting said bell-crank with said valve, substantially as specified.

6. In a hot-air shaft having an inner and an outer passage, the outer passage communicating with the outer air by an aperture, a pivoted valve playing in front of said aperture, a spring attached to the same tending to open it, a stop thereon to limit this tendency of the spring, and an abutment for the stop, in combination with a bell-crank, a slide connected therewith by a link, and means for connecting said valve with said bell-crank, substantially as specified.

7. In a hot-air shaft having an inner and an outer passage, said outer passage communicating with the outer air by an aperture, a pivoted valve playing in front of said aperture, a spring tending to open said valve, and a stop for limiting this tendency of the spring, in combination with means for operating the valve, a link attached to said valve and having a loop, and a locking-pin pivoted near said link and having a projection over which said loop is adapted to fit, substantially as specified.

8. A section of a double-walled air-shaft, having perforated lateral bent portions at each end and provided at one end with slots for the reception of the ribs of an adjacent section and a strengthening-rib at the other, substantially as specified.

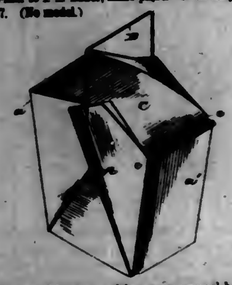
411,653. FOLDING CRIB. FRANK FAY, Chester, Mass. Filed Feb. 8, 1889. Serial No. 299,153. (No model.)

Claim.—1. The combination, with the posts and side and end pieces of a crib-frame, of a crib-bottom and a plurality of links, each of which is pivotally connected at one end to said bottom and at the opposite end to one of the posts of said frame, substantially as and for the purpose described.

2. The combination, with the posts, side pieces, and inwardly-folding end pieces of a crib-frame, of a crib-bottom having an unbroken rectangular frame and two links, each of which is pivotally connected at one end to one of the posts of said crib-frame and similarly connected at its opposite end to one of the end pieces of said bottom-frame, substantially as described.

3. The combination, with the posts, side pieces, and inwardly-folding end pieces of a crib-frame, of a rectangular bottom-frame and a rod or similar device extending from end to end of said bottom-frame and having pivotal connection therewith, said rod having its ends bent at substantially a right angle to the body portion thereof, and having each of said ends pivotally connected, respectively, with one of the posts of said crib-frame, substantially as described.

4. In a crib, posts A, side piece C, having grooves or recesses c' within its inner side, side piece D, and inwardly-folding end pieces B B, combined with bottom E, having a portion of its rear side adapted to enter said groove or recess c' when said bottom is in its operative position, and links connecting said bottom to the two rear posts A, substantially as and for the purpose described.



5. In a folding crib, posts A, side piece C, having the grooves or recesses c' therein, side piece D, having cleat d upon its inner side, and inwardly-folding end pieces B B, combined with woven-wire bottom E, having the projecting end pieces e', and rod G, pivotally connected with said end pieces e', said rod being bent at its ends to form arms g and fingers g', and having said fingers journaled in two of said posts A, arranged and operating substantially as set forth.

6. In a folding crib, posts A, the two rearmost of which are provided with holes a, side pieces C D, and inwardly-folding end pieces B B, combined with bottom E and rod G, pivotally connected to said bottom and having its ends bent to form arms g and fingers g', said fingers being inserted in the holes a in said posts and being of greater length than the depth of said holes, whereby space is left between the arms g and the posts, substantially as and for the purpose described.

7. In the folding crib herein described, the combination, with the two rear posts thereof, bottom E, and rod G, pivotally connecting said bottom with said posts, of stops secured to the end pieces of the crib to limit the swinging movement of said rod, substantially as and for the purpose set forth.

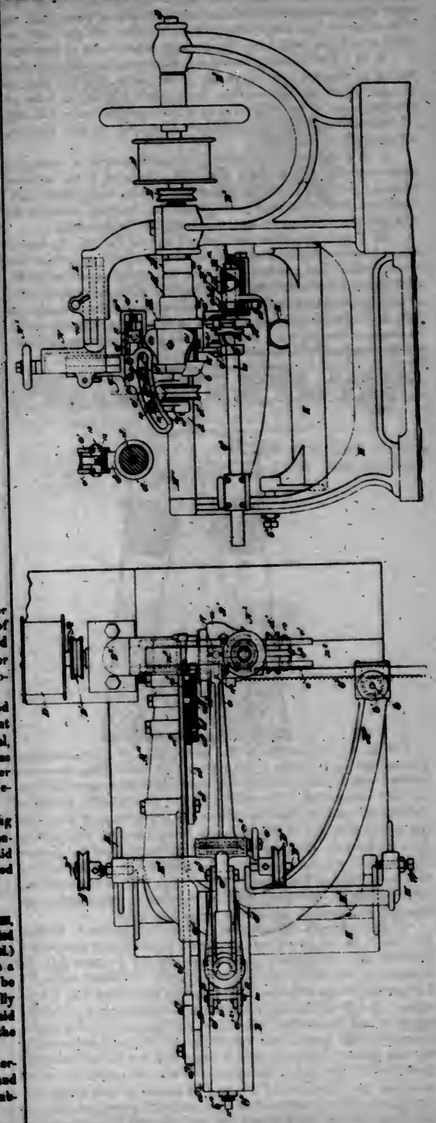
8. In a folding crib, side pieces C D, the former being provided with the recesses c' and the latter with cleat d, and inwardly-folding end pieces B B, combined with bottom E, composed of side pieces e e, end pieces e' e', and woven wire F, said end pieces having their rear ends projecting beyond the rear side piece e, rod G, connected to said end pieces e' e' near their rear ends by means of staples a, said rod having its ends bent to form arms g and fingers g' and having said fingers journaled in side piece C, and wedge-shaped blocks b' b', secured to said end pieces B B upon their inner sides, said blocks b' being so located as to serve as stops to limit the forward movement of rod G at a point where the rear ends of end pieces e' e' of the bottom will clear side piece C, arranged and operating substantially as and for the purpose set forth.

411,654. PAPER VESSEL. WASHINGTON POULTNEY, Dayton, Ohio, assignor of one-half to I. L. Baker, same place. Filed May 9, 1889. Serial No. 310,167. (No model.)

Claim.—1. The combination, with a paper vessel having a cover secured thereto at one end, of a retaining-strip secured to an edge of said vessel, adapted to be engaged by the free end of said cover, and provided with pliant projections extending on each side of said cover adapted to be bent over upon said cover to secure it in position, substantially as described.

2. The combination, with a paper vessel having a cover secured thereto at one end and having its sides provided with notches adjacent to its free end, of a retaining-strip secured to an edge of said vessel, adapted to be engaged by said cover, and having pliant projections extending beyond the edges of said cover adapted to be bent over upon said cover and made to engage said notches, substantially as described.

3. The combination, with a paper vessel, a retaining-strip having pliant projections, and a stiffening-plate secured to said vessel and engaging said retaining-strip, of a cover having one end secured to said vessel, the free end of said cover being provided with notches adapted to be engaged by said projections, substantially as described.



411,655. HEEL-TRIMMING MACHINE. CHARLES W. GLIDDEN, Lynn, assignor to James W. Brooks, trustee, Cambridge, Mass. Filed May 20, 1889. Renewed May 18, 1889. Serial No. 311,203. (No model.)

Claim.—1. In a heel-trimming machine, the combination, with a rotary cutter and a jack to hold the shoe the heel of which is to be trimmed, of a pattern-plate and operative mechanism to automatically impart to the said jack a longitudinally-sliding motion while the said cutter acts to trim the sides of the heel, substantially as and for the purposes described.

2. In a heel-trimming machine, a rocking lever and a rocker-frame pivoted thereon, having a track, combined with a jack and with a cam to slide the jack longitudinally upon the said track, substantially as described.

3. In a heel-trimming machine, a rocking lever and a rocker-frame pivoted transversely thereon, having a track, combined with a jack having an extension B fitted to and adapted to slide longitudinally upon the said track, and with a cam intermediate the said rocker-frame and jack to automatically move the jack longitudinally upon the rocker-frame, substantially as described.

4. The combination, in a heel-trimming machine, of the following instrumentalities, namely: a rotary cutter, a sliding jack to hold the shoe the heel of which is to be trimmed, a rocking support for the said jack, a pattern-plate, and a cam moved by it to change the relative positions of the jack and cutter, substantially as described, whereby the heel is presented to the action of the cutter by a substantially right line movement when the side of the heel is being trimmed, substantially as described.

5. The rocking lever, the rocker mounted thereon and provided with a track, the jack mounted to slide upon the rocker, and a cam to move the jack longitudinally with relation to the cutter while the sides of the heel are being trimmed, combined with the pattern-plate, the gears, guard c^6, and rack bars or plates to actuate the said cam as the pattern-plate is rotated, substantially as described.

6. In a heel-trimming machine, a rotating molded cutter and a carriage having an attached rand or counter guard, combined with a track, as 10, upon which the counter-guard-supporting carriage trav-

ch when uncovering more or less of the knives or blades of the molded cutter, substantially as described.

7. In a heel-trimming machine, a rotating cutter and a carriage having an attached rand or counter guard, combined with a track upon which the said counter-guard-supporting carriage travels when uncovering more or less of the knives or blades of the cutter, and with a tipping jack and connections between the said jack and carriage to automatically move the carriage, substantially as described.

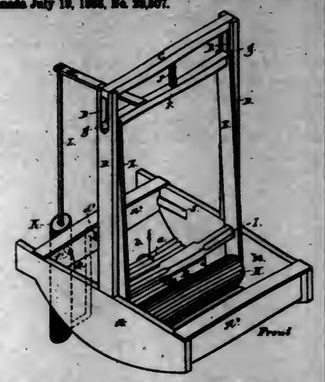
8. In a heel-trimming machine, a rotating cutter and a carriage having an attached rand or counter guard, combined with a track, as 10, upon which the said carriage is supported and travels when uncovering more or less of the knives or blades of the cutter, and with an independently-rotating rand-cutter carried by the said carriage, substantially as described.

9. In a heel-trimming machine, a rotating cutter, a carriage, a rand or counter guard, and a rand-cutter mounted in the said carriage, a track upon which the said carriage moves, and a tipping jack, combined with connections, substantially as described, between the said jack and carriage, to operate substantially as described.

10. The rotary cutter and the jack to hold the shoe the heel of which is to be trimmed, combined with a track, as 10, an independent carriage upon said track, a rand or counter guard attached to the said carriage, the shaft *d*, having its bearings in the said carriage, the rand-cutter attached to the said shaft *d*, and connections between the jack and carriage, whereby the jack as it is tipped also moves the carriage on the said track and with it the said rand-cutter and rand-guard, substantially as described.

411,656. AUTOMATIC FOUNTAIN COFFEE-POT. HENRY C. GREEN, St. Louis, Mo. Filed Feb. 1, 1889. Serial No. 298,249. (No model.)

Claim.—1. In a coffee-pot, the combination of the base-section, the strainer-cup 2, having a reduced beveled lower end that fits within the base-section, and a surmounting fountain-chamber above the irremovable base-section of the coffee-pot, the fountain-tube having an undulating expanded base that allows the free passage of the liquid, the surmounting cap 11, the said tube being provided with perforations 12, through which the fountain-jet discharges, and the strainer-cloth 14, secured to the bottom of the strainer-cup, and also secured at a higher level to the conical tubular collar 9, so as to stretch said strainer-cloth at a sharp inclination to re-enforce it from sagging, substantially as described, and for the purpose set forth.



2. In a coffee-pot, the combination of the base-section 1, the fountain-tube 3, having an expanded base with an undulating bottom and provided with perforations near the top for the fountain-jets, the strainer-cup, the bevel base strainer-section of which fits within the base-section of the coffee-pot, the projecting bead-flange 4 on the periphery of said strainer-cup, that rests on the surmounting projecting ring 5 of said base-section, the strainer-cloth provided with a central opening 15, the elastic seam around the periphery of said opening, the said opening fitting around and embracing the fountain-tube, the stay-ring 17, that secures the strainer-cloth to the cup 2 at a lower level than the attachment of said strainer where it embraces the conical fountain-tube to hold said strainer-cloth at a sharp inclination to re-enforce it from sagging, and the stay-ring 18, that secures the center of the strainer to the fountain-tube, substantially as described, and for the purpose set forth.

3. In a coffee-pot, the combination of the base-section, the fountain-tube having an expanded base with a corrugated or undulating bottom and provided with perforations near the top for the fountain-jets, the flaring strainer center bearer-collar 19 around the fountain-tube, the strainer-cup 2, the strainer-cloth 14, provided with the center opening 15, the elastic seam around said opening, the stay-ring 17, that secures the strainer-cloth to the cup, and the stay-ring 18, that secures the center of the strainer to the fountain-tube at a higher level than at its peripheral attachment to the cup to hold said strainer-cloth at a sharp incline to re-enforce the same from sagging, substantially as described, and for the purpose set forth.

411,657. LOTION. PIERRE GRESSETT, Hoopa, Ill. Filed July 6, 1889. Serial No. 316,899. (No specimens.)

Claim.—The herein-described lotion or composition of matter to be used in the treatment of diseases such as described, the same consisting of spirits of camphor, water of ammonia, sulphate of zinc, water, and salt, in about the proportions specified.

411,658. WASHING-MACHINE. FRED. D. HARMON, Baldwin, Mo. Filed Feb. 16, 1888. Serial No. 264,267. (No model.) Patented in Canada July 19, 1888, No. 29,807.

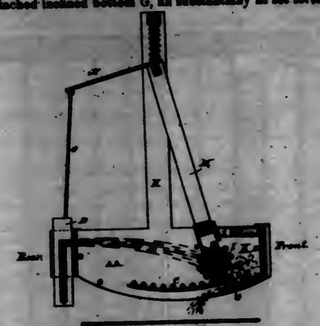
Claim.—1. In a washing-machine, as described, a floor cut away at the rear, a pumping device placed centrally at the rear, and a swinging rubber-roll and its carrying-frame and an arm connecting said frame and pump, all constructed and combined in the manner described, whereby the pump is adapted to deliver a jet of water upon the roll when the roll has been moved to the front rail.

2. In a washing-machine, the combination of the following elements, viz: a swinging frame carrying the washing-roll, a pump centrally located and operated by the movements of said frame to deliver a jet of water at the forward movements of the roll, and a guard over the roll to prevent the upward spattering of the water.

3. In a washing-machine, as described, the combination of the roll and its swinging frame with the floor cut away at the rear and the side wedges or inclines near the top of the side walls and at the rear, whereby the roll-frame may be held at the rear and away from the floor, in the manner and for the purposes set forth.

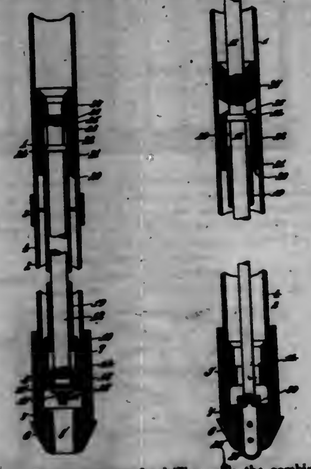
4. In a washing-machine, as described, the casing provided with perpendicular standards B, the swinging frame E, journaled at its upper end in slotted bearings in said standards, the spring J, the washing-roll H, the corrugated bottom, and the centrally-located pump K, automatically operated by said frame and delivering water in jets upon the roll in the manner set forth.

5. The combination of the roll H, mounted and operated as set forth, the floor *a*, cut away at the rear and having an opening *b* between it and the rear part A^2 of the casing, and the pump K, centrally located and operated by the swinging frame, and the guard C over the roll, substantially as described.



6. The combination of the roll H, swinging frame E, spring J, the arm F, attached to the frame and carrying the piston-rod L, the centrally-located pump K, and floor *a*, cut away, as described, in the manner and for the purpose set forth.

411,659. WASHING-MACHINE. FRED. D. HARMON, Baldwin, Mo. Filed June 20, 1888. Serial No. 278,078. (No model.)



Claim.—1. In a washing-machine, a pumping mechanism operated by the bars on which the washing-roll is carried, a corrugated bottom centrally located and having an opening at the front and rear, and steps near the front end to limit the forward movement of the roll, whereby an open space or chamber is formed at the front of the machine, all combined substantially as and for the purposes set forth.

2. A washing-machine in which are combined the following elements: the frame forming the support for the operative parts, a bottom centrally located and having an opening at the front and rear, a rubbing-roll movable over said bottom and connected with and operating a pumping mechanism to throw a jet of water, as described,

and an open top chamber or recess at the front of the machine having the detached inclined bottom G, all substantially as set forth.

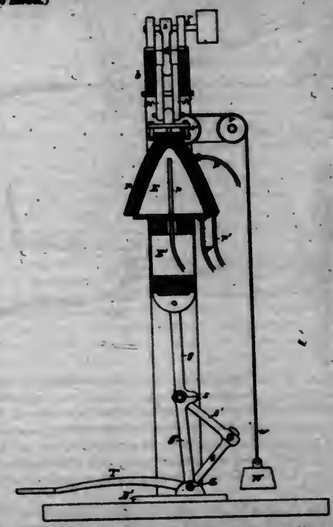
411,660. IMPLEMENT FOR BORING WELLS. LEWIS B. HART, Plaquemine, La. Filed May 13, 1889. Serial No. 310,827. (No model.)

Claim.—1. In an apparatus for drilling wells, the combination, with a well-tube and strainer, of an auger having a cutting-point approximating in form an inverted frustum of a cone and provided with a central opening having its upper end expanded, a hollow plug having openings above its closed rounded extremity, a hydraulic tube carrying said plug, and a packing in the pipe through which said tube passes, substantially as described.

2. In an apparatus for drilling wells, the combination, with a well-tube and strainer, of an auger having a point provided with a central opening, and a hollow plug mounted on the end of the hydraulic tube and provided with openings, part whereof lie above the opening when the plug is seated and discharge within the body of the auger, substantially as described.

3. In an apparatus for drilling wells, the combination, with the well-tube and strainer, of an auger having a body portion with a contracted central opening, a cylindrical nut screwed into a threaded seat in said opening and having a check-valve upon its lower end, a hydraulic tube screwed into said nut, and a boring-point screwed into the body below the valve and having substantially the shape of a frustum of a cone, provided with a central opening, substantially as described.

4. In an apparatus for drilling wells, the combination, with the well-tube and strainer, of an auger having a central opening extending entirely through the same, a hydraulic tube tapped into a nut carrying a spring-raised valve, said nut connected with the auger by a left-hand thread, a washer resting on a shoulder in the auger, a sleeve resting on the washer, a sleeve surrounding the hydraulic tube above the strainer and having concave or countersunk ends and provided with a recess in its upper end receiving a collar on said tube, flexible packings lying in the concave ends of the sleeve, a collar having a conical face and lying between the lower packing and the supporting-sleeve, and a coupling connected to the hydraulic tube and having a conical face resting on the upper packing, substantially as described.



411,661. THILL-COUPLING. LEWIS B. HASKELL, Jr., Salem, Mass., assignor of one-half to Joseph Webster Dean, same place. Filed July 13, 1889. Serial No. 317,988. (No model.)

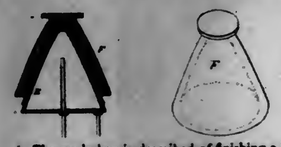
Claim.—1. The herein-described thill-coupling, consisting of the clasp *b* and its ears B B, the shaft-iron *c*, having eye *d* pivoted to said ears, and the yoke *f f'*, combined with the friction-block *h h'*, the packing *i*, the serrated or corrugated washer *k*, and regulating-screw *g*, having its upper end *g'* serrated or corrugated, substantially as and for the purpose set forth.

2. The clasp *b* and its ears B B, and the shaft-iron eye *d*, pivoted to said ears, combined with the yoke *f f'*, friction-block *h h'*, elastic spring *i*, and its expansive band *l*, the corrugated or serrated washer *k*, and regulating-screw *g*, having upper serrated or corrugated surface *g'*, as and for the purpose set forth.

411,662. MACHINE FOR FINISHING HAT-BODIES. CHARLES H. KELTON, Brooklyn, N. Y. Filed Apr. 6, 1889. Serial No. 306,307. (No model.)

Claim.—1. A machine for finishing felt hat-bodies to prepare them for shaping, said machine comprising a pair of heated conical male and female dies separable from each other and of a size and shape to receive and press the hat-bodies as they come from the battery, all substantially as described.

2. A machine for finishing felt hat-bodies to prepare them for shaping, comprising a pair of steam-heated conical male and female dies separable from each other and of a size and shape to receive and press the hat-bodies as they come from the battery, all substantially as described.

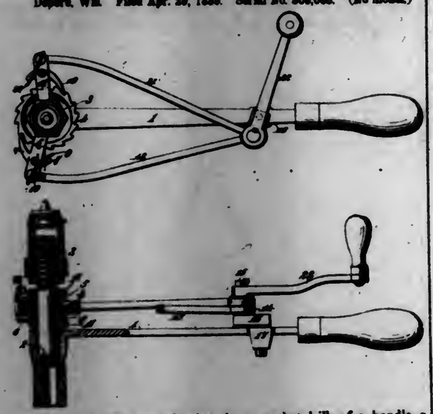


3. The combination of a frame and a pair of conical dies adapted to receive and press a hat-body as it comes from the battery, with means for imparting a short reciprocating motion to one of the dies, all substantially as described.

4. The combination of a frame and a pair of conical dies adapted to receive and press a hat-body, with means for imparting a recipro-

cating motion to one of the dies, and devices for moving the other die toward and from the reciprocating die for the introduction and removal of the hat-body.

5. The combination of the frame and pair of conical dies adapted to receive and press a hat-body, with toggle-levers to raise and depress the lower die and a lever or treadle to operate the toggles, all substantially as described.

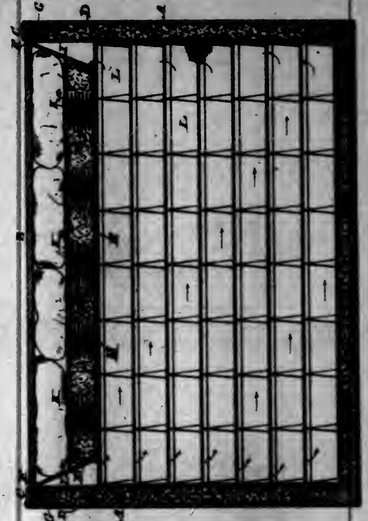


411,663. METHOD OF FINISHING HAT-BODIES. CHARLES H. KEATOR, Brooklyn, N. Y. Filed Apr. 8, 1889. Serial No. 306,808. (No model.)

Claim.—1. The mode herein described of finishing a hat-body to make it ready for the shaping operation, said mode consisting in subjecting the said body to heat and a uniform pressure all over while held in its conical form and free from folds or creases, substantially as set forth.

2. The mode herein described of finishing hat-bodies to make them ready for the shaping operation, said mode consisting in subjecting the hat-bodies to heat and a pounding action uniformly over their whole surfaces while held in their conical form free from folds or creases, substantially as set forth.

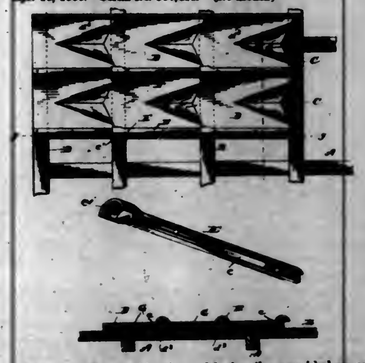
411,664. RATCHET-DRILL. DAN KIDNEY and ALBERT VERBOORT, Depere, Wis. Filed Apr. 20, 1889. Serial No. 308,063. (No model.)



Claim.—1. The combination, in a ratchet-drill, of a handle, a drill-stock having a ratchet-wheel, a pair of pawl-carrying yoke-levers journaled on the drill-stock, a revolving crank journaled on the handle and having an eccentric wrist-pin, two rigid pitmen secured to the wrist-pin and respectively connected with the yoke-levers, and a crank-handle revolving above the pitmen at one side of the drill-stock to continuously revolve the crank in one direction, substantially as described.

2. The combination, in a ratchet-drill, of a handle, a drill-stock having a ratchet-wheel, a pair of pawl-carrying yoke-levers journaled on the drill-stock, a revolving crank journaled on the handle and having an eccentric wrist-pin projecting upward therefrom, two pitmen secured to the wrist-pin and respectively connected with the yoke-levers, and a crank-handle rigidly attached to the wrist-pin and revolving above the pitmen at one side of the drill-stock to continuously revolve the crank and wrist-pin in one direction, substantially as described.

411,665. REFRIGERATOR. MILLER KNICKERBOCKER, Lawtey, Fla. Filed Jan. 16, 1889. Serial No. 296,626. (No model.)



Claim.—1. In a refrigerator-chest, the combination of an air-tight ice-chamber, an elastic absorbent substance in the bottom of said chamber, and a perforated partition between said elastic absorbent substance and the ice within the chamber, substantially as set forth.

2. In a refrigerator-chest, the combination of an air-tight ice-chamber, elastic absorbent substance, and auxiliary spiral springs in the bottom of said chamber and a perforated partition between said absorbent and springs and the ice within the chamber, substantially as set forth.

3. In a refrigerator-chest, the combination of an air-tight ice-chamber, elastic absorbent substance in the bottom of said chamber, a perforated partition between said elastic absorbent substance and the ice within said chamber, and an air-tight packing-chamber below the ice-chamber, substantially as set forth.

411,666. ROOFING-TILE. ROBERT LINDELL, Blakeman, Kans. Filed Apr. 16, 1888. Serial No. 307,411. (No model.)

Claim.—1. The combination, with the tiles provided on one end with a depression or recess and on their opposite end with an undercut portion to form the herein-described lap-joint between the contiguous edges of any two tiles, and being further provided on their upper side with a longitudinal groove, of the retaining-strips provided on their under side with a longitudinal strip or tenon, substantially as set forth.

2. The combination, with the tiles provided on one end with a depression or recess and on their opposite end with an undercut portion to form the herein-described lap-joint between the contiguous edges of any two tiles, and being further provided on their upper side with a longitudinal groove, of the retaining-strips provided on their under side with a longitudinal strip or tenon having one end provided with a semi-cylindrical recess, substantially as set forth.

3. The combination, with the tiles provided on one end with a depression or recess and on their opposite end with an undercut portion to form the herein-described lap-joint between the contiguous edges of any two tiles, and being further provided on their side with a longitudinal groove, of the retaining-strips provided on their under side with a longitudinal strip or tenon located to one side of the center thereof, substantially as set forth.

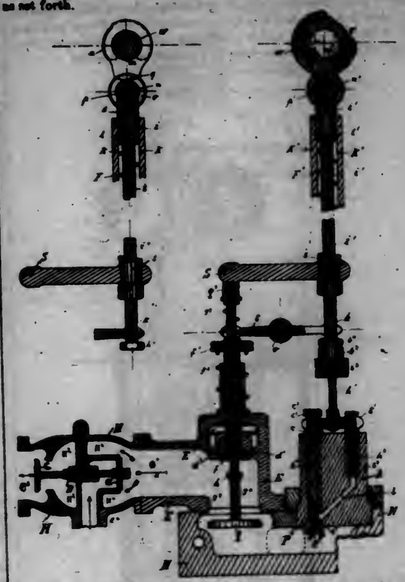
4. The combination, with the rafters and stringers, of tiles resting on said stringers, said tiles being provided on one end with a depression or recess and on their opposite end with an under-cut to form the herein-described lap-joint between the contiguous edges of any two tiles, and being further provided on their upper side with a longitudinal groove and also a channel, of the retaining-strips provided on their under side with longitudinal strips or tenons, and having one end provided with a semi-cylindrical recess, substantially as set forth.

5. The combination, with the tiles provided on their upper side with a longitudinal groove, said groove being contracted in depth at one end, of the retaining-strip provided with a longitudinal tenon fitting in said groove, the end thereof which registers with the diminished or contracted portion of the groove being correspondingly decreased in width to perfect a neat joint, substantially as set forth.

6. The combination, with the tiles provided on one end with a depression or recess, and on their opposite end with an undercut portion to form the herein-described lap-joint between the contiguous edges of any two tiles, and being further provided on their upper side with a longitudinal groove, said groove diminishing in depth at that end of the tile which is provided with the undercut portion, of the retaining-strips provided with a longitudinal tenon fitting in said groove, the portion of the tenon which registers with the reduced portion of the groove being decreased, so as to afford a perfect joint therewith, substantially as set forth.

411,667. CHURN. WILLIAM F. LITTLE, Jonesborough, Ark. Filed June 12, 1889. Serial No. 314,782. (No model.)

Claim.—The combination, with the frame and the cross-bar *d*, provided with an opening for the passage of the dasher-shaft and open at one side, of the dasher-shaft, the standard A, supported in a socket in the cross-bar parallel with the dasher-shaft, the mechanism for reciprocating the dasher-shaft, and the locking-lever K, pivoted at one end on said cross-bar and provided with the notches *l* and *m* to engage said shaft and standard, said notches being of different sizes, the notch *l* being larger to allow free reciprocation of the dasher-shaft, and the notch *m* smaller to bind the standard A, substantially as shown and described, and for the purpose specified.



411,668. GAS-ENGINE. JULIUS MATTHIES, Berlin, Germany. Filed Nov. 14, 1888. Serial No. 290,801. (No model.) Patented in Germany Mar. 20, 1888, No. 45,449.

Claim.—1. In a gas-engine, the combination of the casing A, having the bores for the pistons A^2 and A^3, the channel *b*, connecting said bores, and the channel b^3, leading to the burner, and the pistons A^2 and A^3, the piston A^2 being provided with an annular groove *b'*, substantially as set forth.

2. The combination, with the casing E, of a valve *g*, having a stem g^2, the gas-valve *f*, the arm S, acting on the stem of the valve *g*, a lever *t*, acting on the gas-valve *f*, the rod *i*, connecting with said arm S, a lever *t*, and a cam and a roller for operating the rod *i*, substantially as set forth.

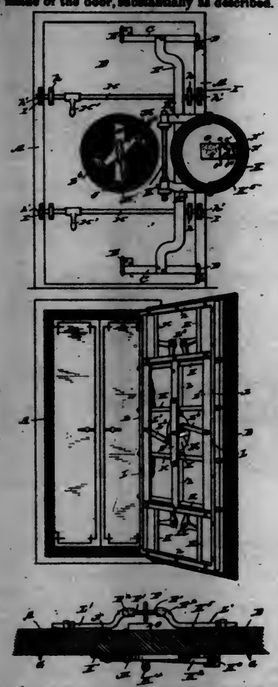
3. The combination, with the casing H, having the channels H^1 H^2, of the sliding stem D and the valves G' G' on the opposite ends of the same, substantially as set forth.

4. In a gas-engine, the combination, with a casing, of a valve in the same governing the admission of the mixture of gas and air to the cylinder, a stem on said valve, an arm acting on said stem, a rod to which said arm is secured, two rollers on the opposite end of said arm, one of the rollers being adjustable, a cam acting on the non-adjustable roller, and a cam acting on the adjustable roller, substantially as set forth.

5. In a gas-engine, the combination, with a casing, of a valve controlling the passage of the mixture of gas and air to the cylinder, a stem to which said valve is secured, a gas-valve having a tubular stem surrounding the stem of the valve that controls the admission of the mixture of gas and air to the cylinder, a pivoted lever acting on the upper end of the gas-valve, an arm acting on the upper end of the stem of the valve governing the admission of the mixture of gas and air to the cylinder, a rod to which said arm is secured, a projection or cut in said rod acting on the lever that rests on the gas-valve, a roller on the upper end of said rod, and a cam acting on said roller, substantially as set forth.

6. The combination, with a casing, of the valve G, governing the passage of the mixture of gas and air to the cylinder, the stem g^2, a gas-valve *f*, having a tubular stem surrounding the stem g^2, a spring f^2, pressing the gas-valve upward, the spring g^3, surrounding the stem g^2 and pressing said stem upward, a pivoted lever acting on the upper end of the gas-valve, the arm S, acting on the upper end of the stem g^2, the rod *i*, from which the arm S projects, the cut *k'* on said rod acting on the lever *t*, and a cam for actuating the rod *i*, substantially as set forth.

411,669. VAULT OR SAFE. JAMES H. MYERS, Rochester, N. Y. Filed Jan. 28, 1889. Serial No. 297,510. (No model.)

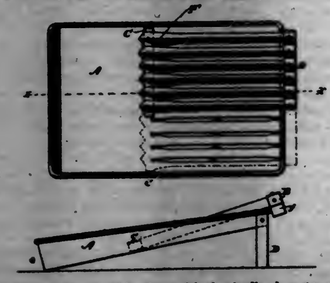


Claim.—1. The combination, with a vault or safe, a door for affording access thereto having suitable bolts and a manually-operated device for operating them located inside the vault, of an aperture through which the bolts of the main door may be operated, an auxiliary door for closing said aperture, and a locking device for said door located entirely within the vault, substantially as described.

2. The combination, with a vault or safe, a door for affording access thereto having suitable bolts, and a manually-operated device located inside the vault for retracting them, of an aperture through which the bolts of the main door may be operated, an auxiliary door for closing said aperture, and a time-lock for guarding said auxiliary door located within the vault, substantially as described.

3. The combination, with a vault or safe, a door for affording access thereto, suitable bolts for securing it, and a manually-operated device located inside the vault for operating them, of an aperture in the main door through which the bolts of the main door may be operated, an auxiliary door for closing said aperture, and a lock for guarding said auxiliary door located within the vault.

4. The combination, with a vault or safe, a door for affording access thereto having suitable bolts, and a manually-operating device for retracting them located on the inside of the safe-door, of an aperture in the main door through which access may be had to the bolt-



operating device, an auxiliary door for closing said aperture, having suitable projections thereon for co-operating with the sides of the aperture when rotated, a hinged supporting-yoke on which the auxiliary door is supported, a dog for preventing the rotation of said door when in closed position, and an automatic lock for retracting said dog located on the inside of the door, substantially as described.

5. The combination, with a vault or safe, a door for affording access thereto having the packing at the edges, and a pivoted supporting link or links upon which it is hinged, of the locking-bolts adapted to be projected from both sides of said door, having their outer sides chamfered or beveled, substantially as described, whereby the projection of the bolts will tightly compress the packing and hold the door closely to its seat, as set forth.

6. The combination, in a vault or safe, of a main door having suitable locking-bolts inaccessible from the exterior, an aperture through which access may be had to the interior of the safe, an imperforate auxiliary door for closing said aperture, and a locking device for said door located within the safe-walls, substantially as described.

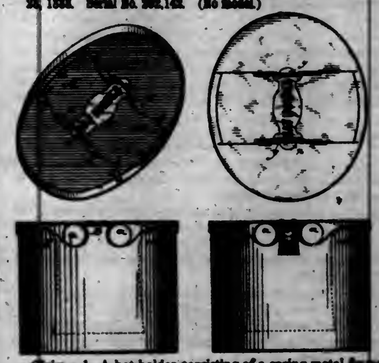
411,670. DRIP-PAN. BERNARD MCGARRITY, Pawtucket, R. I. Filed Feb. 4, 1889. Serial No. 298,992. (Model.)

Claim.—1. The combination, with the inclined rectangular pan having the flat bottom with the slits in the upper portion and the grooves between the slits, of the removable broiler formed with the slits alternating with those in the pan and the retaining devices for holding the broiler at the upper end of the pan, substantially as described.

2. The combination, with the pan having the rectangular body, with the inclined flat bottom having the slits in the upper portion, with the grooves between such slits and the side walls of relatively greater height at the lower end forming a receptacle for the juices, of the broiler at the upper end having the slits alternating with those in the pan, and the depending portions engaging the upper edge of the pan to retain the broiler at the top, substantially as described.

3. The combination, with the pan having the rectangular body, with the inclined flat bottom having the slits at the upper end, with the edges of the slits turned up to form grooves, of the broiler having the corrugated body, with the slits having the downturned edges alternating with those in the pan, and the strengthening-strip at the end, with the depending portion engaging the edge of the pan to retain the broiler at the upper end, substantially as described.

411,671. FLOUR BIN AND SIFTER. JOHN A. MCCLELLAN, Rice, Tex. Filed May 25, 1889. Serial No. 312,094. (No model.)



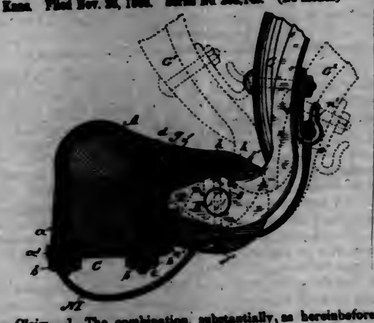
Claim.—1. A bin provided with a door or lid and having sleeves secured to said bin at opposite sides, and screening and sifting mechanism provided with similar sleeves, and two-pronged pins for connecting the screening and sifting mechanism to the bin, substantially as specified.

2. A bin having sleeves secured thereto at opposite sides and removable screening and sifting mechanism provided with similar sleeves, and two-prong pins engaging said sleeves for connecting the sifting and screening mechanism to the bin, the said pins being arranged with their heads in opposite directions, substantially as and for the purpose specified.

3. A screen-frame having recessed and curved end walls and quarto-cylindrical doors hinged thereto upon opposite sides thereof, with their adjacent edges overlapping, substantially as specified.

4. A screen-frame provided with recessed end walls connected by side walls having sleeves thereon, quarto-cylindrical doors hinged to said frame, and sifting and screening mechanism arranged within the screen, combined with a bin having like sleeves and removable prongs engaging said sleeves to detachably hold the screen-frame to the bin, substantially as specified.

411,672. HAT-HOLDER. EDWIN A. NEWMAN, Washington, D. C., assignor of one-half to David L. Swadley, Emporia, Kans. Filed Nov. 26, 1888. Serial No. 292,142. (No model.)



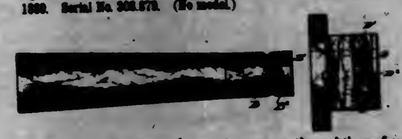
Claim.—1. A hat-holder consisting of a spring-metal frame composed of two similar wings A', each having two parallel sides formed with abrupt bends *c* at their outer ends, and a cross-piece *d*, connecting the two sides and adapted to rest under the brim of the hat.

2. A hat-holder consisting of a spring-wire frame formed of two similar wings A', each of said wings consisting of two sides formed with spring-coils near their inner ends and at their outer ends with abrupt bends *c*, connected by a cross-piece *d*.

3. The combined hat-holder and hat-brush holder herein described, consisting of a spring-wire frame formed with two similar wings A', said wings each having abrupt bends *c* at their outer ends, adapted to rest under the brim of a hat and connected by a cross-piece *d*, and near the middle with spring bends or coils, between which the hat-brush may be held.

4. The combination, substantially as hereinbefore set forth, of the central metallic plate, the spring-metal frame or hat-holder consisting of two similar wings A', extending from each side of the central plate, said wings being each formed with spring-coils near the central plate, and scrolls extending outwardly from said spring-coils and having abrupt bends *c* at their outer ends connected by a cross-piece *d*.

411,673. VEHICLE-SHAFT COUPLING. EDWIN A. NEWMAN, Washington, D. C., assignor of one-half to David L. Swadley, Emporia, Kans. Filed Nov. 26, 1888. Serial No. 292,143. (No model.)



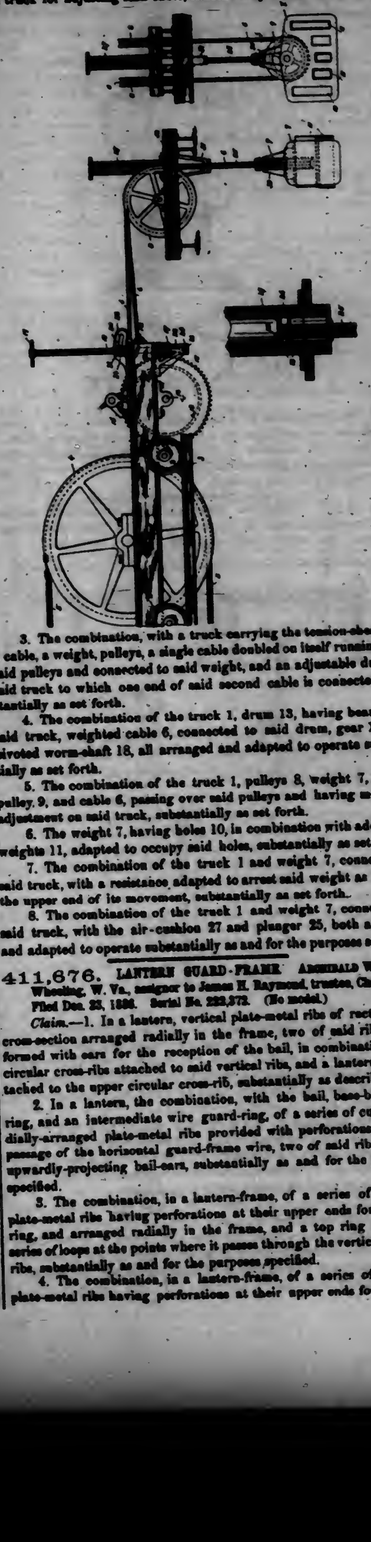
Claim.—1. The combination, substantially, as hereinbefore set forth, of the clip, the forwardly-projecting side pieces, the shafts, the cylindrical pivots resting in open bearings in the side pieces, the removable bottom plate of the clip, the overhanging top flange *d*, projecting beyond the rearwardly-projecting end of the shafts, the cushion D, seated in a socket in the front wall of the clip, said cushion being formed with a concave recess *e*, into which the end of the shafts extend.

2. The combination, substantially as hereinbefore set forth, of the shafts, the open bearings therefor, the strap at one end covering the bearings and secured at its opposite end to the shafts, so that when the shafts are elevated the strip is removed from the bearings.

3. The combination, substantially as hereinbefore set forth, of the shafts, the clips, the forwardly-projecting side pieces, the open bearings therein, the strap enlarged and weighted at one end and secured at its opposite end to the shafts, and the guides for the strip.

411,674. NUT-LOCK. WILLIAM H. OFFUTT, Keyser, W. Va., assignor of one-half to J. Robert Fortune, same place. Filed Mar. 13, 1889. Serial No. 303,079. (No model.)

Claim.—1. A bolt having a spiral groove at the end thereof and a rack between the convolutes of said spiral groove, substantially as shown and described.



2. A bolt having a spiral groove near the end and a spiral rack, combined with a nut having a boss to engage said groove and a dog to engage the rack, substantially as shown and described.

3. The combination, with a bolt formed at one end with a spiral groove, and between the spirals of the groove with a rack, the teeth of which extend parallel with the axis of the bolt, of a nut having a boss engaging said groove, and a dog to engage said rack, substantially as shown and described.

411,675. TENSION DEVICE FOR THE CABLES OF CABLE RAILWAYS. WILLIAM H. FAHIE, New York, N. Y. Filed Feb. 6, 1889. Serial No. 298,954. (No model.)

Claim.—1. The combination, with the truck carrying the tension sheave or pulley, of a cable, a weight, two sheaves or pulleys, and a single cable doubled on itself, as shown, said cable connecting the weight to the truck and having one member passing over each of said sheaves or pulleys, substantially as set forth.

2. The combination, with the truck-carrying tension-sheave, of a cable, a weight, two sheaves or pulleys, and a single cable doubled on itself, as shown, and connected to said weight and having its two members passing over its two sheaves or pulleys, and mechanism on said truck for adjusting said cable, substantially as set forth.

3. The combination, with a truck carrying the tension-sheave, of a cable, a weight, pulleys, a single cable doubled on itself running over said pulleys and connected to said weight, and an adjustable drum on said truck to which one end of said second cable is connected, substantially as set forth.

4. The combination of the truck 1, drum 13, having bearing on said truck, weighted cable 6, connected to said drum, gear 15, and pivoted worm-shaft 18, all arranged and adapted to operate substantially as set forth.

5. The combination of the truck 1, pulleys 8, weight 7, having pulley 9, and cable 6, passing over said pulleys and having means of adjustment on said truck, substantially as set forth.

6. The weight 7, having holes 10, in combination with additional weights 11, adapted to occupy said holes, substantially as set forth.

7. The combination of the truck 1 and weight 7, connected to said truck, with a resistance adapted to arrest said weight as it nears the upper end of its movement, substantially as set forth.

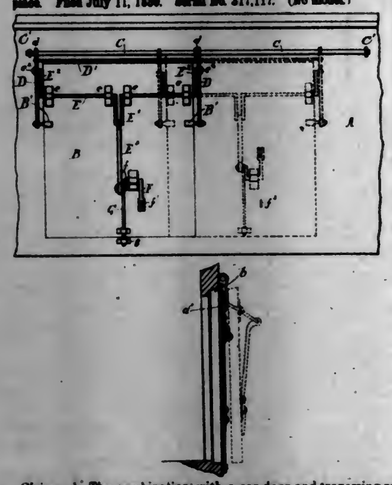
8. The combination of the truck 1 and weight 7, connected to said truck, with the air-cushion 27 and plunger 25, both arranged and adapted to operate substantially as and for the purposes set forth.

411,676. LANTERN GUARD-FRAME. ARCHIBALD W. PAULL, Wheeling, W. Va., assignor to James H. Raymond, trustee, Chicago, Ill. Filed Dec. 23, 1888. Serial No. 293,372. (No model.)

Claim.—1. In a lantern, vertical plate-metal ribs of rectangular cross-section arranged radially in the frame, two of said ribs being formed with ears for the reception of the bail, in combination with circular cross-ribs attached to said vertical ribs, and a lantern-top attached to the upper circular cross-rib, substantially as described.

2. In a lantern, the combination, with the bail, base-band, top ring, and an intermediate wire guard-ring, of a series of curved radially-arranged plate-metal ribs provided with perforations for the passage of the horizontal guard-frame wire, two of said ribs having upwardly-projecting bail-ears, substantially as and for the purposes specified.

3. The combination, in a lantern-frame, of a series of vertical plate-metal ribs having perforations at their upper ends for the top ring, and arranged radially in the frame, and a top ring having a series of loops at the points where it passes through the vertical guard-ribs, substantially as and for the purposes specified.

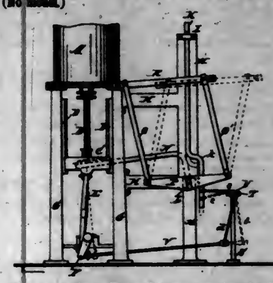


4. The combination, in a lantern-frame, of a series of vertical plate-metal ribs having perforations at their upper ends for the top

ring, two of said ribs having upwardly-projecting bail-ears, said ribs arranged radially in the frame, a top ring having a series of loops at the points where it passes through the vertical guard-ribs, and a bail pivoted in the projecting bail-ears, substantially as and for the purposes specified.

5. The combination of a base-basket comprising ribs of oblong cross-section inserted edgewise to the burner, two ribs being formed with ears for the reception of the bail, the basket having horizontal or cross-ribs, and a top attached to the upper cross-rib, substantially as and for the purposes specified.

411,677. CAR-DOOR. EDWARD L. PRIPPS, Milford, Mich., assignor of two-thirds to Solon H. Wilhelm and Almon D. Webb, both of same place. Filed July 11, 1888. Serial No. 317,117. (No model.)

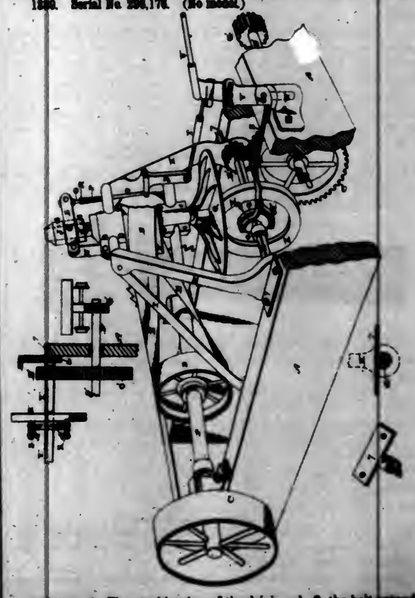


Claim.—1. The combination, with a car-door and traversing rail or rod, of suspenders depending from said rod and engaged with hangers upon the door, a shaft provided with cranks E' E², turned in opposite directions, the latter engaging through slots in the suspenders, a pitman E², and crank-lever F, substantially as and for the purposes described.

2. The combination, with a car-door and its traversing rod, of hangers upon the door engaged with suspenders depending from said rod, a shaft provided with cranks E' E², located between the hangers and the rail, and in connection therewith a pitman and crank-lever for actuating said shaft, substantially as described.

3. The combination, with a car-door and its rail, of hangers upon the door and suspenders depending from the rail, with which the hangers are engaged, a shaft provided with cranks E' E², the latter engaged with the suspenders by a slotted engagement, a pitman E², crank-lever F, and locking-bolt G, substantially as and for the purposes described.

411,678. DEVICE FOR OVERCOMING DEAD-CENTERS. ROBERT L. RAMSAY, Van Cleve, Miss. Filed June 15, 1889. Serial No. 314,348. (No model.)



Claim.—1. In a device for overcoming dead-centers, the combination of the main crank with the spring, the rod connecting the spring to the crank, and means for giving tension to the spring in opposite directions, substantially as and for the purpose specified.

2. In a device for overcoming dead-centers, the combination of the main crank, the rod connecting the spring to the crank, the spring, the bar, the lever, and their connections, and means for oscillating the lever, substantially as and for the purpose described.

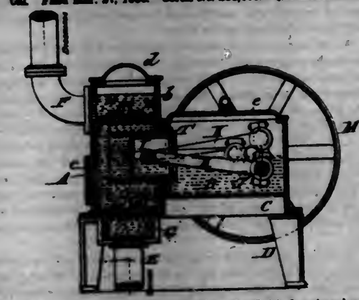
3. In a device for overcoming dead-centers, the combination of the main crank with the spring, the rod connecting the spring to the crank, the spring-bar, the lever, and their connections, the lever-shaft provided with an arm, and the cross-head, substantially as and for the purpose set forth.

4. In a device for overcoming dead-centers, the combination of the main crank with the spring, the rod connecting the spring to the crank, the spring-bar, the link, the double lever, the rods connecting the lever to the links, the lever-shaft provided with an arm, and the cross-head, substantially as and for the purpose described.

411,679. SAW-MILL FEED. SAMUEL T. REAMY, Tappahannock, Va., assignor to T. J. & F. A. Reamy, Nashville, Tenn. Filed Jan. 12, 1889. Serial No. 296,176. (No model.)

Claim.—1. The combination of the driving-shaft, the belt extending therefrom, the upright frame H, the endwise-moving shaft provided with a disk upon its lower end, and the friction-wheel placed upon the counter-shaft, substantially as shown.

2. The combination of the frame, the driving-shaft mounted



thereon, the driving-belt extending from this shaft, the upright frame H, the endwise-moving shaft provided with a disk upon its lower end, a spring-actuated mechanism for moving the shaft endwise, and the friction-wheel placed upon the shaft Y, substantially as described.

3. The combination of the frame, the saw-shaft, the belt extending from the shaft, the endwise-moving shaft, the frame H, in which the shaft is journaled, the yoke which is applied to the shaft, the spring-actuated rod connected to the yoke, the crank, the connecting-rod, the operating-lever, the disk Q, and friction-wheel which engages with the disk on the lower end of the shaft G, and counter-shaft, substantially as set forth.

4. The combination of the lever U, the partially-revolving post V, to which the lever is connected, the lever Z, secured to the post V, the counter-shaft Y, friction-wheel X, the driving-disk Q, placed upon the endwise-moving shaft G, and an operating mechanism for the shaft G, substantially as specified.

5. The combination of the endwise-moving shaft provided with a driving-disk, a belt for driving the shaft, the frame H, in which the shaft is journaled, the collars applied to the shaft, the pivoted yoke which supports the shaft, the rod O, connected to the free end of the yoke, the spring P, placed upon the rod, the bell-crank S, pivoted upon the frame H, the connecting-rod T, and the lever U, mounted upon the partially-rotary post V, with the arm or lever Z, connected to the post, the laterally-movable friction-wheel X, and the counter-shaft, substantially as described.

411,680. PUMPING-MACHINE. JOHN RICHARDS, San Francisco, Cal. Filed Mar. 27, 1888. Serial No. 268,606. (No model.)

Claim.—1. In a pumping-machine, the fluid-chamber having ingress and egress valves arranged in line vertically with each other, in combination with a lubricant-chamber, single or multiple pistons located between the chambers, and actuating mechanism therefor arranged in contact with the lubricating-liquid, substantially as described.

2. In a pumping-machine, the combination of the supporting box-frame, the fluid-chamber having ingress and egress valves located in vertical line with each other, the lubricant-chamber contiguous to the fluid-chamber, the horizontally-reciprocating pistons operating in guide-sleeves between the chambers, and the actuating mechanism for the pistons, consisting of a crank-shaft and connecting-links arranged in the lubricant-chamber, in the manner and for the purpose substantially as described.

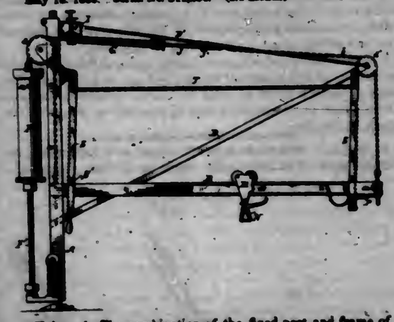
3. In a pumping-machine, the chamber containing lubricating-liquid, in combination with the horizontally-moving pistons of the pumping mechanism, the crank-shaft, and the connecting-links, said parts operating within the lubricant, substantially in the manner and for the purpose specified.

4. In a pumping-machine, the combination of the fluid-chamber, the lubricant-chamber contiguous thereto, and multiple single acting pistons, operating in sleeves supported between the two chambers, as shown, said pistons being exposed on one side to contact with the lubricant and on the other side to contact with the fluid which is being pumped, substantially as described.

5. In a pumping-machine, the two chambers, one containing the fluid to be pumped, the other a lubricant, in combination with pump-barrels between these chambers and pistons operating therein, said pistons being exposed on one side to pumping-fluid and on the other to the lubricant, substantially as described.

6. In a pumping-machine, the combination of the fluid-chamber, the upper and lower compartments therein, as specified, the discharge and suction pipes entering said compartments, respectively, the ingress and egress valves between said compartments and the main interior of the fluid-chamber, the lubricant-chamber, the multiple pump-pistons, the sleeves or barrels within which they operate, and actuating mechanism for said pistons, substantially as described.

7. In a single or multiple pumping-machine, the combination of the supporting frame-work of the machine with two contiguous chambers, one serving as a fluid-chamber and containing the ingress and egress valves, and the other being used as a lubricant-chamber and containing the actuating mechanism of the pump, all substantially as described.



8. The combination of the supporting-frame, the fluid-chamber containing ingress and egress valves vertically in line with each other and provided with a removable plate for access to the ingress-valve and another removable plate for access to the egress-valve and having also an air-chamber above the egress-valve, the lubricant-chamber having a removable plate for access to its interior, and the pumping-pistons, arranged substantially as described.

9. The combination of the rectangular box-frame C, the contiguous chambers A and B, said chamber A having compartments G and H and valves *a* and *b*, the pistons I, crank-shaft J, and link-connections K, all substantially as described.

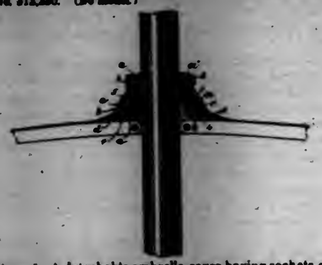
10. The combination of the fluid-chamber A, lubricant-chamber B, pump barrels or sleeves I', pistons I, crank-shaft J, link-connections K, and a driving-power for the crank-shaft, all substantially as described.

11. The combination of the frame C, having supports D, the chamber A, with discharge F and suction E, the valves *a* and *b*, and compartments G and H in said chamber A, the chamber B, containing lubricant, pump-barrels I', pistons I, shaft J, and links K, substantially as described.

411,681. CRANE. WILLIAM H. RIDGWAY, Centerville, Pa. Filed May 18, 1889. Serial No. 311,260. (No model.)

Claim.—1. The combination of the fixed post and frame of the crane, the movable jib, the suspension-chains, and hoisting mechanism therefor, with means for retarding or restricting the movement of the jib, comprising a liquid-reservoir, a cylinder communicating therewith through a contracted passage, and a plunger adapted to said cylinder, one of the parts being carried by the fixed portion of the crane and the other by a movable portion of the same, substantially as specified.

2. The combination of the fixed post and frame of the crane, the movable jib, the suspension-chains, and hoisting mechanism therefor, with means for restricting and regulating the movement of the jib, comprising a liquid-reservoir, a cylinder communicating therewith, a valve for regulating the area of the passage between the cylinder and reservoir, and a plunger adapted to the cylinder, one of the parts being carried by the fixed portion of the crane and the other by a movable portion of the same, substantially as specified.



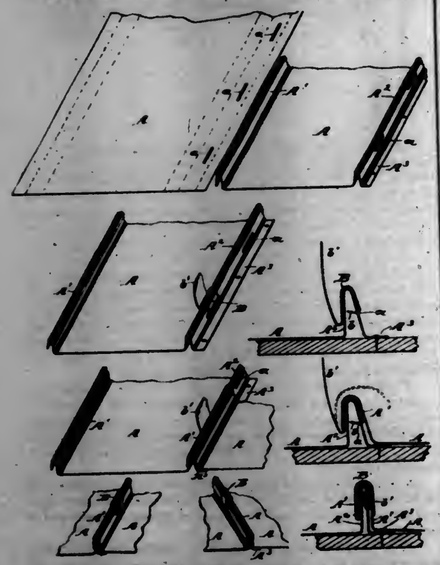
3. The combination of the inclined jib of the crane, the gravity-propelled trolley, and the tripping device for the tongs of the same, with an elastic stop actuated by the trolley as it approaches the limit of its outward movement and serving by its recoil to return the trolley to the higher inner end of the jib after it has delivered its load, substantially as specified.

4. The combination of the jib and its trolley, hoisting devices for the jib, and notched bars and catches for locking the inner and outer ends of the jib, so as to prevent vertical movement, substantially as specified.

5. The combination of the jib and its movable trolley, hoisting devices for the jib, the notched bars and catches for locking the jib in position, said bars being connected and constructed so that when one is in the locking position the other is unlocked, substantially as specified.

6. The combination of the frame and movable jib of the crane, the suspending-chains for the jib, the fixed piston-rod and its piston, and the cylinder connected to the suspension-chains and adapted to the piston, said cylinder being closed at the top but having an escape-opening some distance below the upper end, substantially as specified.

411,682. DETACHABLE COVER FOR UMBRELLAS OR PARASOLS. ANDREW J. ROSEMAN, Boston, Mass. Filed May 27, 1889. Serial No. 312,280. (No model.)



Claim.—1. A detachable umbrella-cover having sockets or other suitable means at the edge to hold it on the bows or ribs, combined with a yielding connection for the stick and two independent collars between which the cover is held, substantially as described.

2. A detachable umbrella-cover having means at the edge for holding it on the bows or ribs, combined with a yielding connection for the stick, and two metallic collars, the upper edge of one of which is turned over the other and formed to bind the cover firmly between them, substantially as described.

3. A detachable umbrella-cover having means at the edge to hold it on the bows or ribs, combined with a yielding connection encircling the stick, two metallic binding-collars for the cover, and an interposed washer of yielding material, substantially as described.

4. A detachable umbrella-cover having means at the edge to hold it on the bows or ribs, combined with a yielding connection encircling the stick, a metallic shield or collar for binding or holding the cover frictionally, and an interposed washer *d*, attached to the cover, substantially as described.

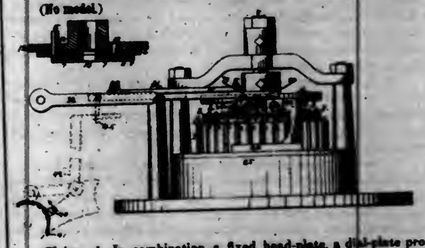
411,683. METALLIC ROOFING. LOVELEY L. SAGENDORPH, Cincinnati, Ohio. Filed July 5, 1889. Serial No. 316,568. (No model.)

Claim.—1. The means herein shown and described for connecting roofing-sheets, the same consisting of a cleat hooked at one end into an opening in the side of one flange-cap, the other end of said cleat being bent back and over the overlapping cap of the adjacent sheet, as set forth.

2. In combination with a roofing-sheet nailed at one side direct to the sheeting, the means herein shown for retaining the cap of the adjacent sheet in place, and consisting of a cleat hooked at one end into an opening in the outer face of one of the flange-caps above the plane of the sheet, the free end of said cleat being bent back and over the overlapping cap of the adjacent sheet, substantially as set forth.

3. In a metallic roof, the sheets A, each sheet having at one side the flange-cap A′ and at the other side the flange-cap A^2, the latter terminating in the nailing-flange A^3, said cap A^2 having in its outer surface suitable openings *a* and a cleat B, one end of said cleat being hooked into the openings *a* between the two flanges of the cap A^2, the free end of the cleat being bent over the cap of the adjacent sheet, substantially as set forth.

411,684. FLOORING-STRIP. ADOLPH M. SCHILLING, Chicago, Ill. Filed Mar. 9, 1889. Serial No. 302,704. (No model.)



Claim.—1. As an article of manufacture, an improved flooring-strip provided with one or more nail-holes square in cross-section, each having its outer end countersunk to receive the nail-head, substantially as and for the purpose shown.

2. As an article of manufacture, an improved flooring-strip provided with one or more nail-receiving holes inclined downward and inward, made in a plane at right angles to the grain of the strip, of a diameter equal to or greater than the thickness of a flooring-strip nail, and in the direction of the grain made narrower than the broadest portion of the nail, substantially as and for the purpose described.

3. As an article of manufacture, an improved flooring-strip having the nail-holes made rectangular in cross-section, with their diameters at right angles to the grain of the strip greater than the thickness of the ordinary form of flooring-strip nails to be used, and their diameters in the direction of the grain less than the width of the broadest portions of such nails, substantially as and for the purpose specified.

4. As an improved article of manufacture, a flooring-strip having one or more rectangular nail-holes for the reception of flooring-nails of the ordinary form, each starting at the angle between the upper side of the tongue and the strip side and running inward and downward within the strip, and made of a diameter equal to or greater than the thickness of the nail in a direction at right angles to the grain of the strip and narrower than the widest part of the nail in the direction of the grain, and having its mouth made flaring or countersunk to receive the nail-head, substantially as and for the purpose shown and described.

411,685. CIRCULAR-RIB-KNITTING MACHINE. RICHARD SCHOFIELD, Paris, Ontario, Canada. Filed Mar. 12, 1887. Serial No. 230,663. (No model.)

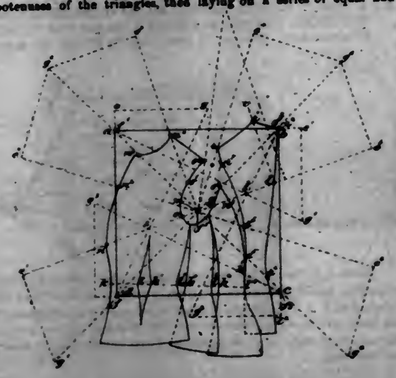
Claim.—1. In combination, a fixed head-plate, a dial-plate provided with suitable needles, a disk-formed base centrally mounted on the dial-plate shaft and eccentrically pivoted to the fixed head-plate, means for oscillating the disk-formed base, a needle-projecting cam fixed centrally to the disk-formed base, a needle-retracting cam pivoted to the said base, and means for locking the pivoted cam to the base, the needle-projecting cam and the disk-formed base being provided with an elongated opening at the point where the dial-plate shaft passes through, whereby the said cam and disk-formed base are permitted an oscillating movement on their eccentric connection with the fixed head-plate, substantially as set forth.

2. In combination, the fixed head-plate, the dial-plate provided with needles, the disk-formed base, the needle-projecting cam fixed to the disk-base, the disk-formed base being pivoted eccentrically to the fixed head-plate and permitted an oscillating movement, the needle-retracting cam pivoted to the disk-formed base, means for oscillating the disk-formed base, and means for locking the heel end of the retracting-cam to the base in different positions to determine the inward movement of the needles, substantially as set forth.

3. In combination, the fixed head-plate provided with an opening, the dial-plate provided with needles, the disk-formed base pivoted to the fixed head-plate, means for oscillating the disk-formed base, the needle-projecting cam fixed to the disk-formed base, the needle-retracting cam pivoted to the disk-formed base, and means for adjusting one end of the needle-retracting cam relatively to the disk-formed base, the said adjusting mechanism being located opposite the opening in the fixed head, whereby the adjustments may be made without separating the parts, substantially as set forth.

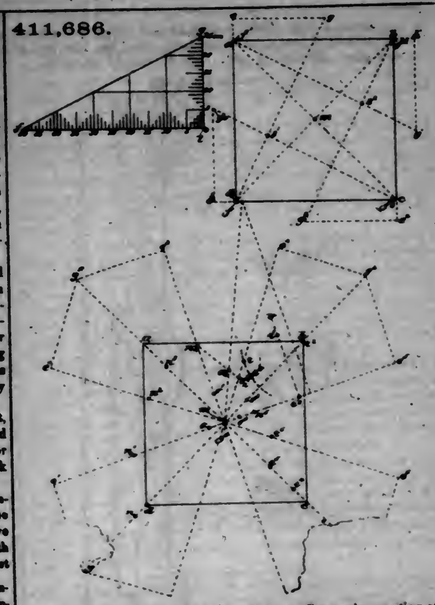
4. In combination, the fixed head-plate, the oscillating disk-formed base pivoted to the head, the projecting and retracting cams thereon to operate the dial-needles, a lever to operate the oscillating disk-formed base, means for vibrating the lever, the said lever being connected at one end to the oscillating disk-formed base and at the other end to its actuating mechanism, and the said operating-lever being formed in two sections having the same pivotal support, and means for locking one of the sections in different adjustments transversely to the other section, substantially as set forth.

5. In combination, the knitting-needles and their rotary support, a pair of fixed jaws between which the yarns pass to the needles, and a reciprocating slide provided with yarn-guides and with an arm or jaw adapted to alternately engage the faces of the fixed jaws to break the yarn, substantially as set forth.



6. The herein-described yarn-changing device, consisting, essentially, of the fixed jaws between which the yarns are directed and the reciprocating slide provided with a clamping-jaw adapted to move back and forth between the fixed jaws, and further provided with yarn-guides to direct the yarns between the jaws, substantially as set forth.

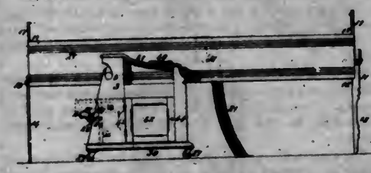
7. The herein-described yarn-changing device, consisting, essentially, of fixed jaws between which the yarn is directed and the reciprocating slide having a movement transverse to the line in which the yarn is fed to the needles, and provided with a depending clamping-jaw adapted to move back and forth between the fixed jaws, and further provided with yarn-guides secured thereto to move simultaneously therewith, substantially as and for the purpose set forth.



8. The herein-described yarn-changing device, consisting, essentially, of fixed jaws having concave faces and the reciprocating slide provided with a clamping-jaw convex on its sides toward the concave-faced jaws, the said reciprocating slide being provided with yarn-guides, substantially as set forth.

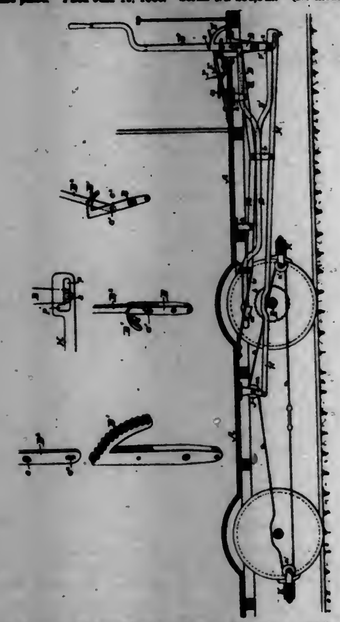
411,686. SYSTEM OF LAYING OUT PATTERNS FOR GARMENTS. CARL SCHNEIDER, Dresden, Saxony, Germany, assignor to himself and Richard Kraemmler, same place. Filed Apr. 19, 1889. Serial No. 307,797. (No model.)

Claim.—The method set forth of cutting wearing-apparel, the same consisting in developing the design from a diagram of a square the sides of which correspond in length with one-half the measurement of the body, such as the waist measurement, laying off upon the square on its interior surface a series of right-angled triangles, each having a base of twenty-five centimeters and a perpendicular of fifty centimeters, the smaller angles being placed at the angles of the square and the perpendiculars coinciding in part with its sides, establishing the central point of the square and the points of intersection of the hypotenuses of the triangles, then laying off a series of equal and



411,686.

similar right-angled triangles having their smaller angles meeting at the center of the square and the hypotenuses of each passing through the angles of the square and the perpendiculars intersecting both the adjacent sides of the square, laying off upon the lines thus formed the decimal parts of one side of the square, as set forth, laying off a right-angled triangle with one of its acute angles at the center of the square, and the base thereof coinciding with one of the perpendiculars intersecting the side of the square, laying off the decimal measurement set forth upon the hypotenuse of said triangle, erecting a line upon the perpendicular which intersects the side of the square, striking from one angle of the square as a center an arc with a radius of four-tenths of the side of the square, and from the point r an arc having a radius of one-tenth of said side, thus establishing the point r^1 and connecting the cutting-points in the manner set forth, substantially as described.



411,687. COMBINED FOLDING BEDSTEAD, SETTEE, &c. EDWARD H. SHEDDY and ANDREW M. BOOTHE, St. Louis, Mo. Filed Apr. 26, 1888. Serial No. 271,944. (No model.)

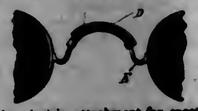
Claim.—1. The combination of the pivoted bedstead, the stationary settee and its frame that provides the curvilinear slotted bearings for the pivot-pins of said bedstead, the depository-box and wash-cupboard within said settee-frame, the door to the wash-cupboard, the elevator wash-stand secured to said door, the standard-bearer of the wash-stand, sectional brackets in which the standard-bearer slides when elevating the wash-stand for usage and when lowering it for folding (when the door closes) within the cupboard, and the means for the sliding attachment of said wash-stand to said door and locking it in its elevated position, substantially as and for the purpose set forth.

2. In combination with a combined settee and bedstead, a door to the settee, having an upper bracket and a lower sectional bracket, a frame carrying a bowl, and an elevating-standard bifurcated at its lower end and adapted to engage one of the parts of the sectional bracket when the bowl is elevated, substantially as shown and described.

411,688. CAR STARTER AND BRAKE. CHARLES A. SHANK, Philadelphia, Pa., assignor to Walter Smith and J. Rex Allen, both of same place. Filed Jan. 19, 1889. Serial No. 296,842. (No model.)

Claim.—1. The combination of the axle having a ratchet-wheel, the platform-lever having rods carrying pawls for engaging with said ratchet-wheel, and a brake-operating rod also connected to said lever, but independent of the pawl-rods, substantially as specified.

2. The combination of the axle having a ratchet-wheel, the platform-lever, the rods connected thereto and having pawls engaging with said ratchet-wheel, a brake-rod movable into or out of operative connection with the platform-lever, a treadle on the platform, and means for connecting said treadle to the pawl-rods and brake-rod, whereby one may be thrown into action when the other is thrown out of action, substantially as specified.



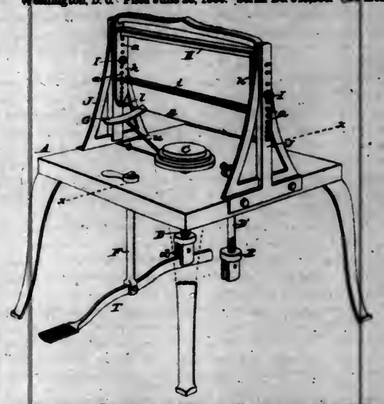
3. The combination of the platform-lever with the brake-rod having a horizontal slot with vertical offset for the reception of a pin on the lever, substantially as specified.

4. The combination of the platform-lever having an operating-arm loosely pivoted thereto, a notched quadrant on one of said parts, and an engaging stud or projection on the other part, substantially as specified.

5. The combination of the platform-lever having an operating-arm loosely pivoted thereto, a notched quadrant on one of said parts, a stud on the other part for engaging with said quadrant, and a retainer for holding the lever after it has been moved, all substantially as specified.

6. The combination of the platform-lever having a forked arm terminating in a notched quadrant, and an operating-arm for said lever having a slot-and-pin pivot-connection therewith, and a stud for engaging said notched quadrant, all substantially as specified.

411,689. ELECTRIC ATTACHMENT FOR EYEGLASSES. CHARLES C. SMITH, Mohawk, and BERNAH W. MARTIN, Ilion, assignors to the Electrical Spectacle and Eye-Glass Manufacturing Company, (Limited,) Mohawk, N. Y. Filed Feb. 8, 1889. Serial No. 299,167. (No model.)



Claim.—1. An electric attachment for spectacles, consisting of two T-strips of different metals having their T's adapted to be bent around the bridge of said spectacles, substantially as described.

2. An electric attachment for spectacles, consisting of two T-strips of different metals held together by means of clasps bent as described, and having their T's adapted to be bent around the bridge of said spectacles, substantially as described.

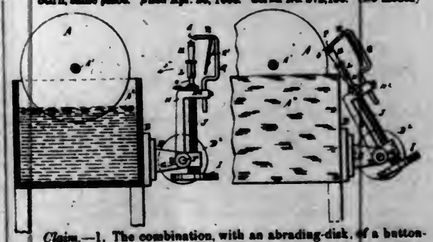
3. An electric attachment for spectacles, consisting of a plain strip in T form of one metal and a branched T-strip of another metal, the branches of the latter being bent around the body of the former and the T's of both being adapted to be bent around the bridge of said spectacles, substantially as described.

411,690. TILE-CUTTING MACHINE. THOMAS BRIDENTHAL, Jr., Washington, D. C. Filed June 26, 1889. Serial No. 315,598. (No model.)

Claim.—1. The combination, in a tile or pipe cutting machine, of a swinging cutter-frame having a cutter permanently secured thereto and a frame for supporting the same, the two being connected by adjustable pivots, whereby the cutter can be made to move in the arcs of different circles without changing the height of the cutter in relation to the pipe-support, substantially as described.

2. The chuck C, in combination with the movable support or rod D and a foot lever or treadle for operating the same.

3. In combination with the pivoted or swinging cutter-frame, the chuck C, adapted to fit within the end of the pipe and hold the same while being cut.



4. In a tile-cutting machine, the chuck C, adapted to fit within the end of the pipe and arranged to hold the pipe at the required angle in relation to the swinging cutter *e*, substantially as shown and described.

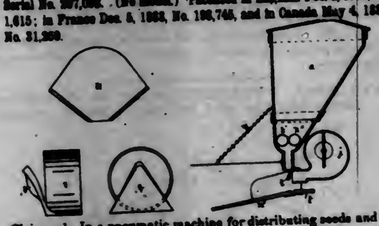
5. In combination with the chuck C, arranged to hold the pipe at an angle to the cutter *e*, the separately-adjustable hinged brace G, constructed and arranged to operate substantially as and for the purpose set forth.

6. In combination with the supports or rods D and D', the internally-adjustable foot lever or treadle, substantially as and for the purpose set forth.

7. In combination with the movable support D or D' and a foot lever or treadle for operating the same, a stop for limiting the movement of the support.

411,691. MACHINE FOR GRINDING AND FINISHING THE EDGES OF BUTTONS. MAX STERN, New York, N. Y., assignor of one-half to Leo Stern, same place. Filed Apr. 20, 1888. Serial No. 272,159. (No model.)

Claim.—1. The combination, with an abrading-disk, of a button-supporting frame mounted to swing toward and from the rim of the abrading-disk, a lever, a plate on said lever mounted to swing toward and from the top of the button-support and provided with an aperture through which the eye of the button can pass, substantially as shown and described.

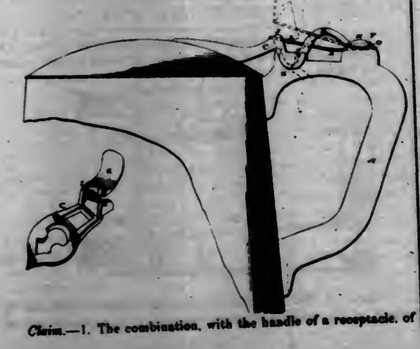


2. The combination, with an abrading-disk, of a frame mounted to swing toward and from the rim of said abrading-disk, a rotative shaft in said frame, a button-support on the shaft, an arm on said frame, a lever pivoted on said arm, and an apertured disk on one end of said lever, substantially as shown and described.

3. The combination, with an abrading-disk, of a frame mounted to swing toward and from the rim of the same, a rotative shaft in said frame, a chuck on said shaft, a button-support in said chuck, an arm on the frame, an angle-lever on said arm, an apertured plate on one end of said angle-lever, and a spring acting on the angle-lever and pressing that end carrying the apertured plate from the end of the button-support, substantially as shown and described.

4. The combination of the shaft D, having a friction driving-disk, the shaft F in line with the shaft D, which shaft F is mounted to slide in the direction of its length and to rock, a spring for pressing the shaft F in the direction from the shaft D, a frame on said shaft, a rotative shaft in said frame, a friction driving-disk on the rotative shaft in the frame, a beveled collar on the shaft F, and a fixed sleeve having a beveled end adjacent to the bevel of the collar on the shaft F, substantially as shown and described.

5. The combination, with a shaft and an abrading-disk on the same, of a board mounted longitudinally adjustable in the direction of the shaft carrying the abrading-disk, a driving-shaft on said board, a swinging frame on said shaft, and a rotative shaft in said swinging frame and driven by said driving-shaft, and a button-holder on said rotative shaft, substantially as shown and described.



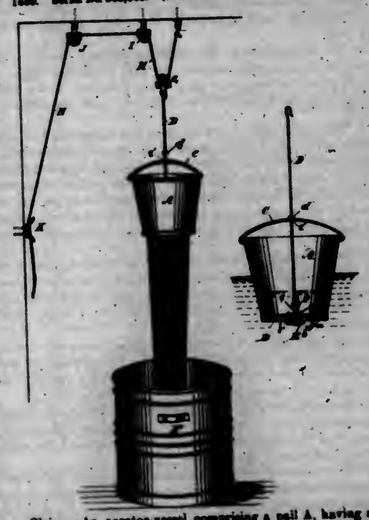
411,692. SEEDER AND FERTILIZER-DISTRIBUTER. GEORGE F. STRAWSON, Newbury, County of Berks, England. Filed Jan. 21, 1889. Serial No. 297,092. (No model.) Patented in England Feb. 3, 1888, No. 1,615; in France Dec. 5, 1888, No. 190,748, and in Canada May 4, 1889, No. 31,269.

Claim.—1. In a pneumatic machine for distributing seeds and insecticide-powder or other dry composts, the combination of feeding device *k' F'*, delivery-nozzle *r*, and spreading or scattering board *n*.

2. In a pneumatic machine for distributing seed and dry insecticides and composts, the combination of feeding device *k' F'*, delivery spout or nozzle *r*, scattering-board *n*, and wind-guard *p*.

411,693. HANDLE. HIRAM R. STERNER, Groton, N. Y. Filed Apr. 26, 1889. Serial No. 308,057. (No model.)

Claim.—1. The combination, with the handle of a receptacle, of a lid-casting having its front end secured to the lid and its rear end formed into an operating-piece, the said casting journaled upon the handle near its center, and a spring having one end secured to the handle and its opposite free end bearing upon the said casting in front of said journal when the lid is closed and in rear thereof when open, whereby the cover is held either open or closed, substantially as described.



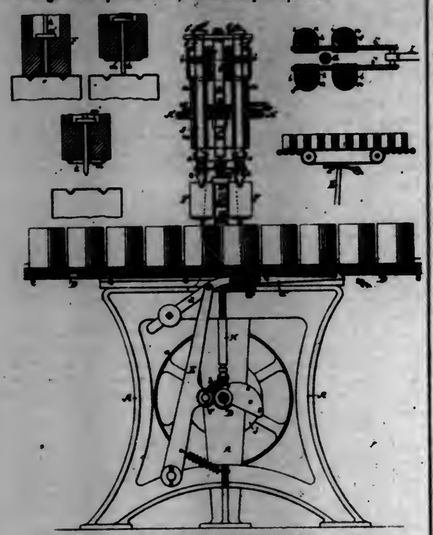
2. The combination, with the handle of a receptacle having a recess in the upper side, of a lid-casting journaled in the said recess and having its front end secured to the lid and its rear end formed into an operating-piece, and a spring having its rear end rigidly secured to the handle and its opposite free end extending forward and bearing upon the said casting, whereby it is held firmly but detachably on the handle, substantially as shown.

3. The combination, with the handle of a receptacle having a recess in its upper side, an operating lid-casting having a journal resting in said recess, and a projection in front of said bearing when the lid is closed and in rear thereof when turned in a vertical position, of a horizontal flat spring having its rear end secured to the handle and its free front end resting upon the said projection, whereby the lid-casting is held firmly but detachably upon the said handle and either open or closed, substantially as shown and described.

4. The combination, with the handle of a receptacle having a recess in its upper side, of a lid-casting having a projection resting in the said recess and downwardly-projecting lugs upon each side whereof for holding it in place, and a spring having its rear end secured to the handle and its free end extending forward and resting upon the said casting, in the manner described, substantially as specified.

5. The combination, with the handle of a receptacle and a lid-casting journaled thereon having its front end secured to the cover, the said handle having a horizontal aperture provided with a vertical projection, of a flat spring having an aperture in its rear end fitting over the said projection and its forward end extending forward and bearing upon the said lid-casting, in the manner described, substantially as set forth.

411,694. MILK-AERATOR. PITT W. STRONG, Brockville, assignor of one-half to Ogle Gates, Smith's Falls, Ontario, Canada. Filed Apr. 3, 1889. Serial No. 305,998. (No model.)



Claim.—An aerator-vessel comprising a pail A, having a perforated bottom provided with a central port *b'*, and a bar C across the top, a rod D, passing loosely through said bar and port and provided with a suspending-pulley G and stop *d*, and a valve E, connected to the lower end of said rod below the bottom of the pail, whereby the port is opened by the downward movement of the rod when the pail is afloat and closed when the pail is lifted by the rod for its suspension, as set forth.

411,695. CAN-CAPPING MACHINE. THEOPHILUS VAN KANNEL and GEORGE R. LOMYOOD, Philadelphia, Pa., assignors to George H. Odbert, same place. Filed Mar. 12, 1889. Serial No. 302,992. (No model.)

Claim.—1. The combination of the capping-iron spindle and means for raising and lowering and rotating the same, with a capping-iron

universally jointed to said spindle, whereby it is free to assume different angles in respect thereto, substantially as specified.

2. The combination of the capping-iron spindle and means for raising, lowering, and rotating the same, with a capping-iron and a universally-jointed and laterally-swinging connection between said spindle and iron, said connection comprising two links and four sets of pivots, two of which are at right angles to the other two, substantially as set forth.

3. The combination of the capping-iron and its spindle with a universal-joint connection between the two, comprising upper and lower links and an interposed pivot-block, the pivots of one pair of links being at right angles to those of the other pair, substantially as set forth.

4. The combination of the frame of the machine, a can-carrier mounted so as to be free to traverse thereon and having openings or notches therein, a lever carrying a pawl for engaging with said notches, and a cam acting on said lever and having that portion of its surface which imparts the forward thrust divided into three parts, the first and last of which impart slow movement to the lever, while the intermediate portion imparts a rapid movement, substantially as specified.

5. The combination of the notched can-carrier guided on the frame of the machine, the vibrating lever, and a pawl carried thereby and engaging with the notches of the can-carrier, said pawl being made in two parts, one adjustable longitudinally in respect to the other, all substantially as specified.

6. The combination of the traversing can-carrier, a series of capping-irons, a lifting-rod having a yoke from which said capping-irons are suspended, an arm acting on said lifting-rod, and a cam and cam-rod, whereby said arm is actuated, substantially as specified.

7. The combination of the capping-irons, the lifting-rod therefor, and an operating-cam for said rod having the portion which controls the descent of the rod in two parts, the first abrupt and the second less abrupt, substantially as specified.

8. The combination of the capping-irons, the lifting-rod therefor, and an operating-cam for said rod having two lifting portions, with an intermediate dwell, whereby there are two steps in the rise of the capping-irons, substantially as specified.

9. The combination of a series of capping-irons having spindles with pinions thereon, means for raising and lowering said spindles, and a vertically confined and reciprocated rack the width of which is equal to the extent of rise and fall of the spindles, substantially as specified.

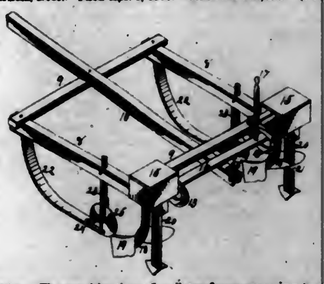
10. The combination of the series of capping-irons and their spindles having pinions, means for raising and lowering said spindles, vertically confined racks equal in width to the extent of rise and fall of the spindles, a lever connected to said racks, and a cam for acting upon said lever, substantially as specified.

11. The combination of the capping-irons having spindles with pinions thereon, racks for operating said pinions, and a rack-operating cam having two portions, one for imparting short quick movements to the rack and the other for imparting longer movements, all substantially as and for the purpose set forth.

12. The combination of the capping-iron and its hollow spindle, the universal-joint connection between the two, a retainer-rod passing through an enlarged opening in the bottom of the iron, and a disk covering said opening and confined laterally to the retainer-rod, but vertically unconfined thereto, as set forth.

13. The combination of the can-carrier, the capping-iron, the blast-pipe and its valve, and a shaft having a cam for effecting the raising and lowering of the capping-irons, and a cam for opening and closing the valve in the blast-pipe, whereby the blast may be cut off during the soldering operation and while the capping-irons are in action, substantially as specified.

14. The combination of a series of capping-irons and radially-adjustable bearings for the spindles of the irons, whereby the latter may be simultaneously adjusted both longitudinally and laterally to suit different sizes of cans, substantially as specified.



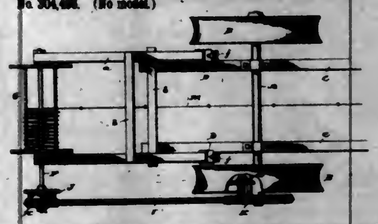
15. The combination of a series of capping-irons, radially-guided bearings for the spindles of the irons, and a cam-disk for effecting the radial adjustment of the spindle-bearings, substantially as specified.

16. The combination of the capping-irons laterally adjustable in respect to each other to suit different sizes of cans and having spindles with driving-pinions thereon, with a duplex operating-rack for said pinions, said racks being likewise adjustable laterally, substantially as specified.

17. The combination of the capping-iron spindles, the guided sleeves therefor radially adjustable on the frames, pinions on the spindles, and a laterally-adjustable duplex rack gearing with said pinions and adapted to guides on the sleeves of the spindles, as set forth.

18. The combination of the can-carrying tray and a supporting-guide therefor having laterally-adjustable tracks or ways for the tray, as set forth.

411,696. DOUBLE-LISTER CORN-PLANTER. WILLIAM WATSON, Fairfield, Nebr. Filed Apr. 6, 1889. Serial No. 306,260. (No model.)

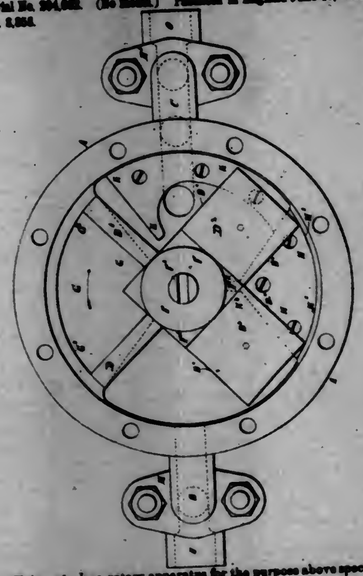


Claim.—The combination of a lister-frame carrying two double mold-board plows, a subsoiler in rear of each of said plows, runners secured to the frame and extending rearwardly, colters located in front of the plows, a main frame having a hinge-joint connection with the lister-frame, a driver's seat located thereon, and a hand-lever for adjusting the relation of the two frames with each other, substantially as set forth.

411,697. WITHDRAWN.

411,698. WITHDRAWN.

411,699. CHECK-ROW WIRE-REEL ATTACHMENT. WILLIAM H. WEEKS and GEORGE WEEKS, Hazwood, Ill. Filed Mar. 23, 1889. Serial No. 304,498. (No model.)



Claim.—1. The combination, with the planter-frame and its wheels, of the attachment thereto, consisting of the sprocket-wheels, sprocket-chain, drum, and smooth pulley, all substantially as shown and described.

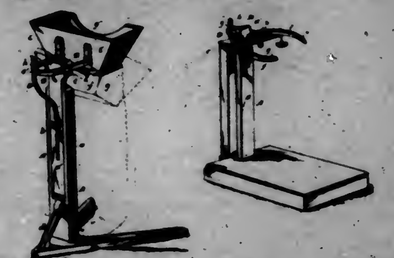
2. The combination, with the planter-frame and the wheels, of the castings on the planter-frame, the blocks c, the attachment-frame detachably held in said castings and resting on said blocks, the drum journaled in the rear end of said attachment-frame, the sprocket-wheel on the bearing-wheel, the sprocket-wheel on the shaft of the drum, and the endless chain connecting said sprocket-wheels, substantially as and for the purpose specified.

3. In an attachment to corn-planters, the combination, with the side bars, of the transverse shaft journaled in the rear ends of said side bars and extended beyond one of the same, the drum on said shaft between the side bars, the sprocket-wheel on said extended end, the smooth pulley also on said extended end and of less diameter than said sprocket-wheel, and the endless sprocket-chain connecting the said sprocket-wheel with a sprocket-wheel on the wheel of the planter, substantially as shown and described.

411,700. ROTARY METER. WILLIAM WILLS, Bromley, and JESSE SMITH and WILLIAM H. SMITH, Penge, England. Filed Dec. 19, 1888. Serial No. 294,022. (No model.) Patented in England June 16, 1888, No. 8,854.

Claim.—1. In a rotary apparatus for the purposes above specified, the combination of a cylindrical chamber or casing having wide and narrow segments with parallel sides and of different radii, a central rotary hub, spindles carried thereby, so that their axes intersect each other, vanes fixed in pairs upon the said spindles at right angles to each other and having their sides parallel to the axis of the corresponding spindle and their outer ends straight and at right angles to their sides, and an incline or striking-piece for turning the said vanes about their axes in their rotation about the axis of the hub, for the purposes above specified.

2. In a rotary apparatus for the purposes specified, the combination of the cylindrical chamber or casing A, having the wide and narrow segments G G' G² and H H' H², with parallel sides and of different radii, the rotary hub F, the spindles E E', carried thereby, so that their axes intersect each other, the vanes D D' D² D³, having parallel sides and straight ends at right angles thereto and fixed in pairs upon the said spindles, the incline or striking-piece K, for turning or adjusting the vanes in their rotation about the axis of the said hub, and the guide L, for facilitating the entrance of the vanes into the narrow segments, substantially as and for the purposes set forth.



3. In a rotary apparatus for the purposes described, the combination, with the cylindrical chamber or casing, of square or rectangular vanes fixed in pairs upon spindles E E', the axis of which intersect each other, a rotary hub F, through which the said spindles are passed, and which is provided with a square part or collar F², having bearing-surfaces equal in width to the said vanes, and an incline or striking-piece K, for turning or adjusting the vanes in their rotation about the axis of the said hub, substantially as and for the purpose set forth.

4. In a rotary apparatus for the purposes specified, the combination, with the cylindrical chamber or casing, of the hollow hub F, the vanes D D' D² D³, the spindles E E', having taper parts to receive the said vanes and extending through the said hub, with their axes intersecting each other, and the bush or plug surrounding one of the said spindles and closing the cavity in the said hub, substantially as and for the purposes set forth.

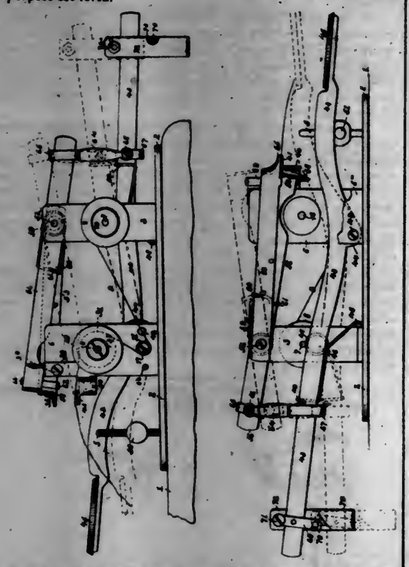
5. In a rotary apparatus for the purposes specified, the combination of the cylindrical chamber or casing, the laterally-projecting inlet and outlet pipes B C, having flanges M M' in a plane at right angles to and intersecting the axis of the said chamber or casing, the hollow hub F, the vanes D D' D² D³, the spindles E E', having taper parts to receive the said vanes and extending through the said hub, with their axes intersecting each other, and the bush or plug surrounding one of the said spindles and closing the cavity in the said hub, substantially as and for the purposes set forth.

6. In a rotary apparatus for the purposes specified, the combination, with the square or rectangular vanes and the hub having the square part or collar, of the cylindrical chamber or casing provided with the wide and narrow segments, and the entrance and exit edges H³ of the narrow segment converging for a short distance from the cylindrical part of the said hub and then diverging, substantially as and for the purpose set forth.

411,701. BAG-HOLDER. BENJAMIN K. WILSON, Cherryfield, Me. Filed June 20, 1889. Serial No. 316,008. (No model.)

Claim.—1. In a bag-holder, a standard consisting of a stationary part recessed upon its rear side and a vertically-adjustable part fitting within the recess and held in its adjusted position by a thumb-screw, in combination with a spring-catch carried by the adjustable part and a bag-holding device pivotally connected to the upper end of the adjustable part of the standard, and having a rearward U-shaped extension adapted to automatically engage with said spring-catch, substantially as shown and described.

2. The bag-holder described, consisting of the adjustable standard, the jaws pivotally connected with the upper part of said standard by means of a horizontal pivot and provided with a rearward extension, and a spring-plate attached at its lower end to the rear side of the upper part of said standard, and formed at its upper end with a square shoulder and forwardly-inclined upper face, substantially as shown and described, and for the purpose specified.



411,702. THREAD-SLACKENING DEVICE FOR SEWING-MACHINES. CHARLES J. WOODWARD, Brooklyn, N. Y. Filed Aug. 24, 1888. Serial No. 283,494. (No model.)

Claim.—1. In combination with the pull-off mechanism, the nipper mechanism, a tension-shaft having tension device and a brake-wheel fixed thereon, a brake-lever adapted to engage said brake-wheel, one end of said lever carrying a latch-lever, and mechanism for tripping the latter, substantially as and for the purpose set forth.

2. The combination of the pull-off and nipper levers, said pull-off lever having a projection for acting on the thread, the brake mechanism having connection with said levers, whereby both may be operated simultaneously, the tension-shaft and brake-wheel thereon, and the bed or table with which the nipper-lever engages to nip the thread when the brake-wheel is released by said brake mechanism, substantially as set forth.

3. The combination of the tension device mounted on a rotatable shaft carrying a brake-wheel, pull-off and nipper levers, said pull-off lever having a projection, a spring connected with said levers and tending to press them in opposite directions, a stop for preventing said levers being pressed away from each other, mechanism for operating the two levers carrying a brake-shoe for acting on the brake-wheel, and a bed or table with which the nipper-lever engages to nip the

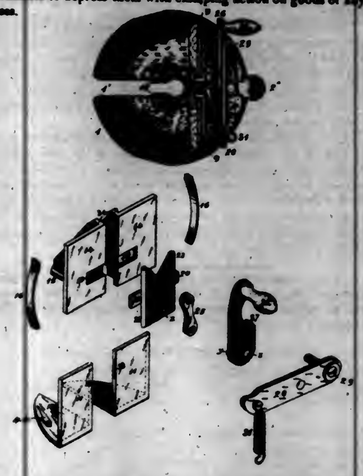
thread when operated by said mechanism, substantially as and for the purpose set forth.

4. The combination of the brake-lever and tension-shaft having a brake-wheel and tension device with pull-off and nipper levers connected by adjustable pitmans and links to said brake-lever, said pull-off lever having a projection, and a bed or table with which the nipper-lever engages, substantially as and for the purpose set forth.

5. The combination of the tension-shaft having a brake-wheel, the brake-lever, a spring adapted to throw said lever against the brake-wheel, nipping mechanism by which the thread may be held, a tension device around which the thread passes to said nipping mechanism, pull-off mechanism, and a stop to limit the movement of the lever when withdrawn from the brake-wheel, substantially as described.

6. The combination of the tension-shaft having a tension device and a brake-wheel, the brake-lever formed with a brake-shoe, a spring for holding the brake-lever in normal position, means for releasing the brake-lever, a pull-off lever connected with and operated by said brake-lever, said pull-off lever having a projection for acting on the thread, and nipper mechanism, substantially as described.

7. The combination of the tension-shaft having a tension device and brake-wheel thereon, a braking device, a bracket having a U-shaped part and jaw, the nipper-lever having a jaw, and the pull-off lever having a laterally-projecting end, and operating mechanism for said levers and brake, substantially as described.



8. The combination of the tension-shaft and wheel, the bracket having a U-shaped part and lower jaw, the nipper-lever having an upper jaw, the pull-off lever having a projection, the brake-lever, connection between the nipper-lever and pull-off lever, and connection between the pull-off lever and brake-lever, substantially as and for the purpose set forth.

9. The combination of the tension-shaft, the bracket having a U-shaped part and lower jaw, the nipper-lever having an upper jaw, a pull-off lever having a finger, a bolt by which the levers are fulcrumed, a spring surrounding the bolt and having one end engaging over the nipper-lever and the other end engaging under the pull-off lever, and means for operating the levers.

10. The combination of the brake-lever, the block secured to the rear end of the brake-lever, the latch-lever hinged to the block, a sewing-machine and its tension mechanism, a bracket, a device on the bracket for lifting the latch-lever, and the nipper and pull-off mechanism, substantially as and for the purpose set forth.

411,708. BUTTON-HOLE CLAMP FOR SEWING-MACHINES. CHARLES J. WOODWARD, Brooklyn, N. Y. Filed May 21, 1889. Serial No. 312,769. (No model.)

Claim.—1. In a button-hole clamp for sewing-machines, the combination, with spring-depressed fulcrum-bar, of operating-lever fulcrumed thereto and having link-and-slide connection with the clamp-jaws, whereby the same lever which raises the clamp-jaws is made available to depress them with clamping action on goods of any thickness.

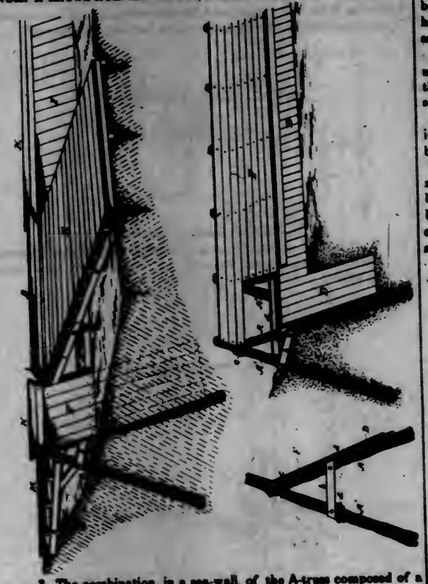
2. In a button-hole clamp for sewing-machines, the combination, with the two sets of both laterally and vertically separable clamping-jaws, of the vertically-moved slide having a projection which occupies recesses in the upper clamping-jaws, an operating-lever linked to said slide and fulcrumed in spring-depressed fulcrum-bar, and whose lip is adapted to engage with and partially rotate the spreading-cam, the said fulcrum-bar, and the said spreading-cam, whereby the same lever is instrumental in the successive operations of raising the upper clamp-jaws, of depressing the same, and of spreading the two sets of lower and upper jaws and locking them to the clamped and spread condition on goods of any thickness, as set forth.

3. In a button-hole clamp for sewing-machines, the combination, with spreading-cam on vertical axis, of the spring-contracted upper and lower clamp-jaws, the lower clamp-jaw shanks being inclosed within and forced apart by the upper clamp-jaw shanks, as set forth.

4. In a button-hole clamp for sewing-machines, the combination of the pair of right and left U-formed standards, the inclosed jaw-shanks and their contracting-springs, the vertical spreading-cam, (separating the right and left cam-shanks,) and the operating-lever, as set forth.

5. In a button-hole clamp for sewing-machines, the combination, with the operating-lever and with the standards and the winged spreading-cam, of adjustable back-stop 39 10 41 and adjustable front or amplitude stop 40 42, as set forth.

6. In a button-hole clamp for sewing-machines, the combination, with base 1, having the pivot-post 6, and with standards 2 9 and the spreading-cam 7, of the back-stop 30 10 41, having the lip 43 for preventing vertical displacement of the spreading-cam.

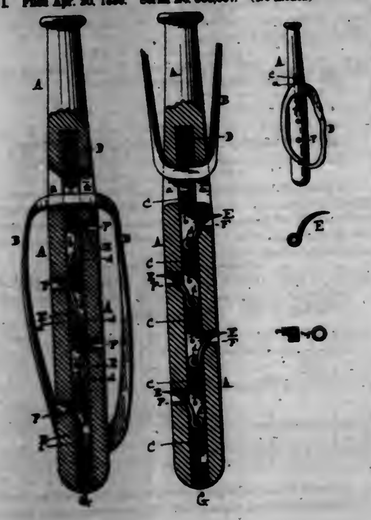


7. In a button-hole clamp for sewing-machines, the combination of the following elements, to wit: the base-plate 1 1', having the spreading-cam 7, the pair of right and left U-formed standards 9 9, having the rear extension 4, the quadruplex clamp 13 13 15 15, and the contracting-springs 16 16, as set forth.

8. In a button-hole clamp for sewing-machines, the combination of the following elements, to wit: the movable base 1, having the right and left U-formed standards 9 9, having the rear extension 4, the spring-depressed fulcrum-bar 28, the operating-lever 26 *x y* 37, the link 25, the slide 20 21, and the pair of normally-contracted upper clamp-jaws having the recesses 19 19, as and for the purposes set forth.

411,704. CONSTRUCTION OF BREAKWATERS, SEA-WALLS, JETTIES, &c. THEODORE F. WOOD, Bridgeton, N. J. Filed June 20, 1889. Serial No. 315,092. (No model.)

Claim.—1. The combination, in a breakwater or jetty, of the piles 'A A', forming an A-truss, substantially as shown, with a cross-piece uniting these piles and clamps or stringer-bars tying the series of piles together, with vertical sheathing on the exterior piles, substantially as described.

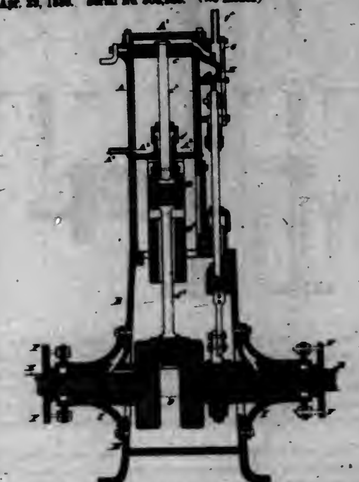


2. The combination, in a sea-wall, break-water, or jetty, of the piles formed in the shape of an A-truss, the rear piles extending beyond the junction, braces connecting the piles together, sheathing on the exterior face of the piles, and sheathing on the extended portion of the rear piles at an incline to the main sheathing, whereby the water is thrown from the sea-wall, substantially as described.

3. The combination, in a sea-wall, of the A-truss composed of a series of piles arranged substantially as described, with extensions of the rear piles, sheathing on the main portions of the sea-wall, and sheathing on the extended portions of the rear piles, with a driveway, and a hinged portion of the extended sheathing adapted to lie flat upon the driveway or to be placed in an upright position, substantially as described.

4. The combination of the A-truss with the extension of the rear piles extending above the junction of the two piles forming the truss, sheathing on the outer surface of the front pile, with a board walk on the rear of the sea-wall, and a seat supported by the extension of the rear pile, substantially as shown and described.

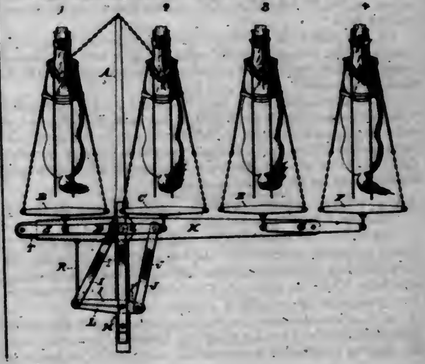
411,705. POLICEMAN'S CLUB. CHARLES R. ADAMS, Providence, R. I. Filed Apr. 20, 1889. Serial No. 308,007. (No model.)



Claim.—1. A policeman's club having a central longitudinal bore and holes at intervals extending from the outer surface thereof to said bore, in combination with a bar movable lengthwise in said bore and having barbs pivotally mounted on said bar and extensible through said holes by a pulling device, substantially as specified.

2. A club having side perforations and a central bore, in combination with barbs mounted pivotally within said bore and extensible through said perforations, and a pulling device to operate said barbs, substantially as described.

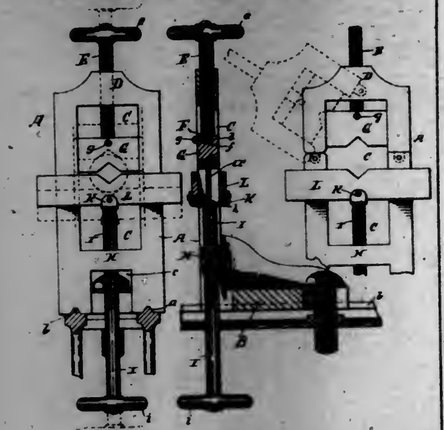
3. A club having a bore or channel, barbs mounted and movable in said bore or channel, and a pulling device adapted to extend said barbs beyond the outer surface of the club, substantially as described.



4. The combination of a club having a longitudinal bore and holes at intervals extending from the outer surface thereof to said bore, a bar movable lengthwise in said bore, barbs pivotally mounted on said bar, a pulling device adapted to draw said bar and to extend said barbs outwardly, and a spring adapted to automatically withdraw said bar and its connected barbs inwardly, substantially as specified.

411,706. STEAM-ENGINE. ALBERT T. BOOTH, Louisville, Ky. Filed Apr. 22, 1889. Serial No. 308,268. (No model.)

Claim.—The combination, in a single-acting vertical engine in which the cylinder is provided with a steam-port at its upper end and an exhaust-port independent of the lower side of the piston, of a lower head in the cylinder, between the crank-pit and the piston, provided with a stuffing-box for the piston-rod, and a pipe leading from the lower end of the cylinder to the atmosphere to carry off the water of condensation that escapes past the piston, substantially as and for the purpose described.



411,707. FOUR-HORSE EVENER. JOHN C. BOSSE, Rich Prairie, Minn. Filed May 11, 1889. Serial No. 310,450. (No model.)

Claim.—1. A four-horse evener comprising a short main lever having its short arm connected to a long draft-lever carrying the doubletree of the field horses, and its long arm connected to the doubletree of the pole horses and to a thrust-bar, which is also connected to the latter doubletree, substantially as specified.

2. The combination, with the main iron lever L, having arms of unequal length, of the long draft-lever K, carrying the doubletree of the field horses, the oblique strap-connections I and J, the doubletree of the pole horses, the thrust-bar, the lateral guiding-strap, and the tie-rod connecting the long arm of said main lever to said thrust-bar, substantially as specified.

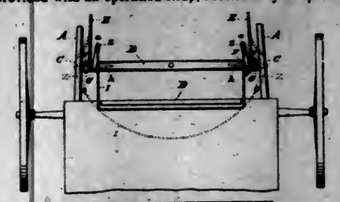
411,708. **WORK-HOLDER.** WILLIAM B. BRADSHAW, Lectonia, Ohio. Filed May 3, 1889. Serial No. 310,042. (No model.)

Claim.—1. In a work-holder, the combination of the cut-out frame, as shown, a pair of independently-sliding jaws adapted to slide one above and into the other within part of the said cut-out portion, with the adjusting-screws, one of which has its bearing in one of the said jaws, and the other having its bearing in a strap secured to the other of said jaws, substantially as described, and for the purpose set forth.

2. In a work-holder, the combination of the cut-out frame, the sliding jaws having a V-shaped notch formed in their upper and lower portions, respectively, with a perforated strap having its ends bent to receive one of the said jaws, and a pair of oppositely-situated adjusting-screws, substantially as shown and described.

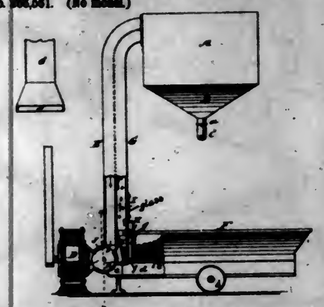
3. In a work-holder, the combination of the cut-out frame, a pair of sliding jaws, one of which forms a journal-bearing and the other of which is adapted to accommodate a journal-bearing strap, with the journaled adjusting-screws, substantially as shown, and for the purpose specified.

4. In a work-holder, the combination of the cut-out frame having the upper and lower portions screw-threaded, with a slotted sliding jaw and a sliding jaw having a hole in the top thereof adapted to receive the end of an adjusting-screw, substantially as and for the purpose set forth.



5. In a work-holder, the combination of the cut-out frame, of the hinged portion thereof, with the adjustable jaws having V-shaped notches formed therein, and the adjusting-screws, substantially as shown and described.

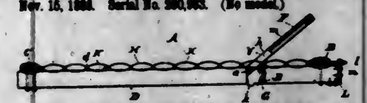
6. In combination with a work-holder, the frame A, the sliding V-shaped notched jaws G and L, located one above the other, one of which is adapted to slide into the other, the perforated strap, the adjusting-screws having journal end portions, and an enlarged head *f* on the end of one of the said adjusting-screws, substantially as shown and described, and for the purpose set forth.



411,709. **HORSE-DETACHER.** DAVID R. BROWN, Passaic, N. J. Filed Feb. 7, 1889. Serial No. 299,026. (No model.)

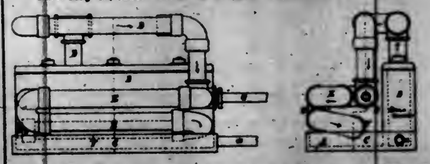
Claim.—1. The horse-detacher consisting of the attachment F, having the broad bearing end *l*, and the lever-hook G, having the hook portion N, pivoted to said end bearing, the inwardly-extending connection V, and the over-curved lever-arm Z, extending from said lever-connection, substantially as specified.

2. In a horse-detacher, the shouldered attachment F, adapted to be secured to the end of a singletree and having the broad end bearing *l*, and in combination therewith the lever-hook G, consisting of the hook portion N, pivoted to said end bearing and having its inner edge in line with the shoulder of the attachment, the connection V, extending inward therefrom, and the forward over-curved lever-arm Z, provided with an operating-strap, substantially as specified.



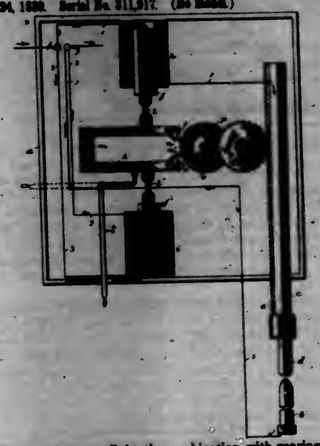
411,710. **APPARATUS FOR COOLING, STONING, AND RACKING COFFEE.** ROBERT BURR, Brooklyn, N. Y. Filed Mar. 8, 1888. Serial No. 266,561. (No model.)

Claim.—1. The combination of an air-suction apparatus, a receptacle for containing the material to be operated on and having an air-channel *g*, a hopper, a suction-pipe leading from the hopper to the air-suction apparatus, a delivery-pipe leading from the hopper to the receptacle and having an air-channel *f* in communication with the air-channel of said receptacle, and a gate for controlling communication between said receptacle and channels *f* and *g*, substantially as described.



2. The combination of an air-suction apparatus provided with a valve-chamber J and a channel *e*, a rotary valve K in the valve-chamber, a receptacle F, having a perforated bottom and an air-channel *d* thereunder for connecting with the air-channel *e*, a hopper A, a delivery-pipe G, leading from the hopper to the receptacle and having an air-channel *f* in communication with the receptacle above the perforated bottom, and a suction-pipe E between the hopper and the air-suction apparatus, substantially as described.

411,711. **BED-BOTTOM.** ELON R. CASE, Robinsville, Ind. Filed Nov. 15, 1888. Serial No. 290,963. (No model.)



Claim.—A bed-bottom consisting of the transverse series of elliptic springs, the end bars B and C, extending through the end spirals, and the side rail having the angle-irons, and adjusting devices for the bar B, consisting of the notted screw-threaded bolts engaging said angle-irons, substantially as specified.

411,712. **VAPOR-GENERATOR.** GEORGE W. CLARK, Boston, Mass., assignor of one-half to the Automatic Heater Company, Portland, Me. Filed May 19, 1888. Serial No. 274,498. (No model.)

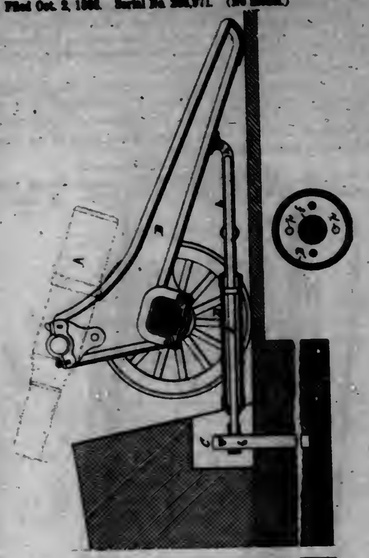
Claim.—The combination of the trough C, having as its rear wall or boundary the steam-generator B, the water-supply pipe a, connected with said generator, the retort E and tube F above the trough and connected together, said tube F having the holes *b*, the steam-conduit D, leading from the generator B into the retort E, and the hydrocarbon-supply pipe G, leading also into the retort E, as set forth.

411,713. **ARC LAMP.** FRANK P. ORR, Terre Haute, Ind. Filed May 24, 1889. Serial No. 311,917. (No model.)

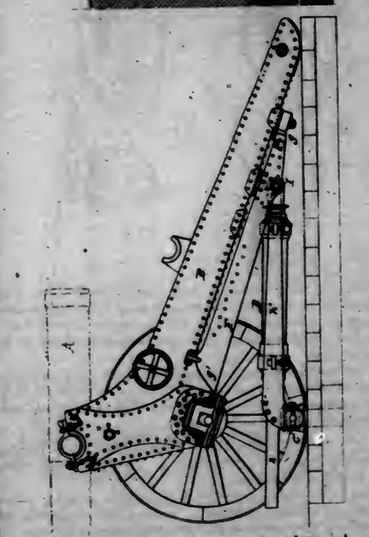
Claim.—1. In an arc light, the combination, with gearing to positively adjust the carbons, of a freely and vertically swinging armature-lever or frame pivoted at one end and having a pair of parallel arms each provided with means, respectively, to operate said gearing in opposite directions to raise or lower the carbon, an electro-magnetic device directly acting on said lever to draw the same in one direction to operate the gearing to lengthen the arc, and an opposing shunt electro-magnetic device directly acting on said frame directly against the force of the main magnetic device to swing the frame in the opposite direction and actuate the gearing to lower the carbon, substantially as described.

2. In an arc light, the combination, with gearing to positively adjust the carbons and a notched wheel to operate said gearing in both directions, of a single freely-swinging armature-lever or frame having a pair of pawls to engage said notched wheel and respectively rotate the same in opposite directions when said lever is swung in opposite directions, a magnet in the main circuit to draw said lever in one direction and raise the carbon, and an opposing shunt-magnet to draw said lever in the opposite direction against the force of the main magnet to lower the carbon, substantially as described.

3. In an arc light, the combination, with mechanical means to adjust the carbons and a notched wheel to actuate the same to raise or lower the carbon, of an armature-lever pivoted at one end to swing in a vertical plane and having a pair of arms extending from the pivotal point toward said wheel, pawls on the ends of said arms to respectively and oppositely rotate the wheel when said lever is swung in opposite directions, a series coil directly above and having its armature connected to the upper arm of said lever to raise the same, and a shunt-coil directly below and having its armature connected to the lower arm of the same, substantially as described.



4. The combination of an approximately U-shaped frame pivoted at its closed end to swing in a vertical plane, oppositely-extending pawls on the ends of the arms thereof having stops, a ratchet-wheel rotated in opposite directions by said pawls, gearing operated by said wheel, a carbon-holder having a rack engaged by the gearing, a vertical series coil located above and having a core loosely connected with the upper arm of said frame, and a vertical shunt-coil located below and having its core loosely connected with the lower arm of said frame, substantially as described.



5. In an arc light, the combination of a swinging frame to raise or lower a carbon, a series and a shunt electro-magnetic device to swing the frame in opposite directions, and a lever connected with said frame and by which the same can be operated by hand to raise the carbon, substantially as described.

411,714. **PREPARING PYROTECHNIC COMPOUNDS.** ANTONIO EM. GRAMEN, Naples, Italy, assignor to Charles H. Reusens and George A. Mannix, both of Petersburg, Va. Filed Jan. 5, 1889. Serial No. 295,994. (No specimens.)

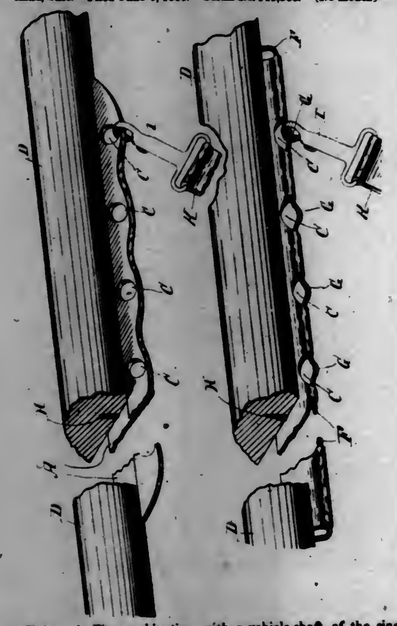
Claim.—The process herein described for the manufacture of the pyrotechnic compound set forth, said process consisting in dissolving picric acid in hot water, adding carbonate of magnesia thereto to form a solution of picrate of magnesia, then dissolving nitrate of potash in water, and mingling the latter solution with the former, producing a precipitate consisting of a picrate of potash, $(C_6H_2(NO_2)_3OK.)$ reducing said precipitate to a granular condition, and drying, substantially as described.

411,715. **HYDRAULIC BUFFER FOR SIEGE AND OTHER GUN CARRIAGES.** PIERRE L. A. DE MONTGOLFIER, St. Chamond, Loire, France. Filed Oct. 2, 1888. Serial No. 288,071. (No model.)

Claim.—1. The combination of a gun-carriage and an upright pivot fixed in the foundation and about which the carriage can move in a horizontal plane, with a buffer-cylinder and a piston, one connected to the carriage and the other to the fixed pivot, and the piston having a rod passing through the opposite ends of the cylinder, all substantially as described.

2. The combination of a gun-carriage and a fixed pivot therefor with a buffer-cylinder and a piston, one connected to the carriage and

the other universally jointed to the pivot, the said piston having a rod passing through opposite ends of the cylinder, all substantially as described.



3. The combination of a gun-carriage and a pivot therefor with a buffer-cylinder connected to the said carriage and a piston having a rod passing through opposite ends of the cylinder and connected to the pivot, all substantially as described.

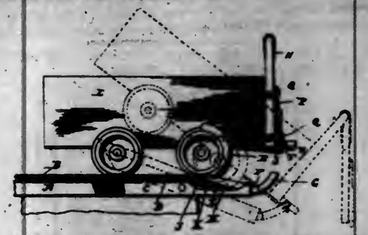
4. The combination of a gun-carriage and a fixed pivot therefor with a buffer-cylinder and a piston, one connected to the carriage and the other universally jointed to the pivot, substantially as described.

5. The combination of a gun-carriage and a pivot therefor with a piston and a rod universally jointed to the pivot, a buffer-cylinder in which the piston works, and cheeks connecting the cylinder with the carriage, all substantially as set forth.

6. The combination of a gun-carriage having a beam or stiffener F connected at one end to the trail and at the other to the body of the carriage, with a fixed pivot for the carriage and a buffer-cylinder and piston, one connected to the pivot and the other to the beam or stiffener, all substantially as specified.

411,716. HOLDBACK-FASTENING. CHARLES FOLSOM, Bellefontaine, Ohio. Filed June 6, 1889. Serial No. 313,288. (No model.)

Claim.—1. The combination, with a vehicle-shaft, of the single plate attached to the under side and projecting inward on the same plane with the shaft, the projecting part having the holes C therein for the reception of the snaps on the holdback-strap, as and for the purpose set forth.

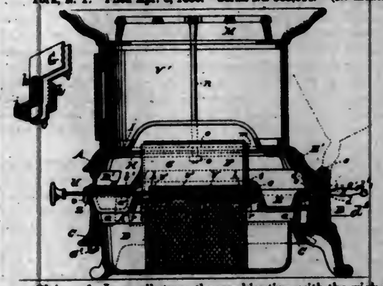


2. The combination, with a buggy-shaft, of the sheet-metal piece E, having holes C therein, and the wire F, secured between the pieces of sheet metal and bent at G to form a loop to receive the holdback-snap, as and for the purpose set forth.

411,717. PREPARING FLOUR FROM CURD OF MILK. WILHELM SUTTER, Rorschach, St. Gall, Switzerland. Filed Jan. 31, 1889. Serial No. 298,259. (No specimens.)

Claim.—The process hereinbefore set forth for preparing a flour from curd, said process consisting in curdling milk, separating the curd from the whey, comminuting the curd, exposing the same repeatedly to alternate heating and cooling processes, and then grinding the curd, substantially as described.

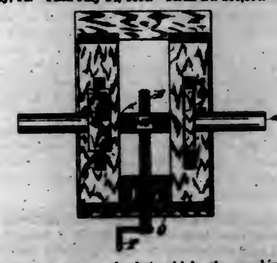
411,718. DUMPING-CAR. FRANK J. GIBB, Tyrone, Pa. Filed Jan. 30, 1889. Serial No. 298,008. (No model.)



Claim.—1. The combination, with the car having an opening in its bottom, of the swinging end-gate, the bolt mounted thereon and adapted to engage said opening, and the spring secured to the bottom of the car and carrying a pin adapted to enter said opening and bear against the end of the bolt, as set forth.

2. The combination of the platform having a tilting section, the car moving over the platform and provided with the swinging end-gate, the bolt mounted on the end-gate and engaging the bottom of the car, the spring secured to the bottom of the car and bearing against the bolt, and the rock-shaft mounted on the tilting section of the platform and having a crank-arm at one end adapted to bear against the spring and provided with an operating-lever at its other end, as set forth.

3. The combination of a dumping-car having a swinging end-gate hinged to its upper front end, a bolt or latch arranged to slide vertically on said end-gate and engaging an opening or keeper in the bottom of the car, an arm or spring attached to the under side of the car and having a stud bearing against the lower end of the bolt, and a rock-shaft having an arm which, when the car is tilted, may be brought into contact with the spring or arm, so as to release the bolt of the end-gate, substantially as set forth.



411,719. OIL-STOVE. JACOB GOLDSTEIN and ISRAEL BLOCK, New York, N. Y. Filed Apr. 3, 1889. Serial No. 305,811. (No model.)

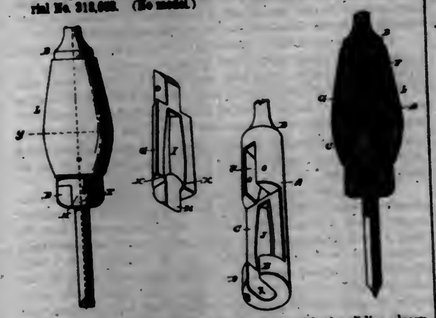
Claim.—1. In an oil-stove, the combination, with the wick-holder pan and its hollow slotted ridges, of the wick-tubes recessed at their lower ends, as shown, and having at the sides of said recesses vertical bearing lugs or flanges for the wick-rollers, said lugs or flanges having horizontally-extended slotted flanges for the fastening-screws connecting the same to said ridges, substantially as specified.

2. In an oil-stove, the wick-tubes having their lower edges cut away or recessed, the lateral vertical bearing-flanges thereof, the fastening-flanges, and the exposed solid wick-rollers socketed and provided with extended operating-rods, substantially as specified.

411,720. TWO-WHEELED VEHICLE. ROBERT W. HARR, Allegheny, Pa. Filed July 24, 1888. Serial No. 280,896. (No model.)

Claim.—1. In a two-wheeled vehicle, the combination, with the body A, having the flanges or guides *c c* located on either side of its base, of the frame A', having the grooved side pieces *a*', in which said flanges move, the threaded bent *g*, attached to the axle, the threaded rod E, having the sleeve *e*, and the bar G, depending from the body, the several parts being constructed and arranged substantially as described, so that by turning said rod the body will be shifted on the reach, as set forth.

2. In a two-wheeled vehicle, the combination, with an adjustable body and means for operating the same, of auxiliary springs arranged substantially as described, and for the purpose set forth.

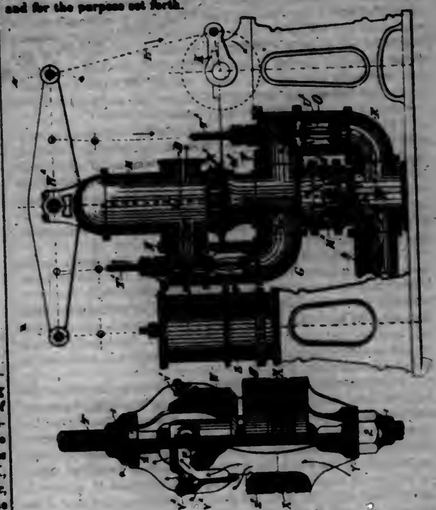


3. In a two-wheeled vehicle, the combination of the following elements: screw-threaded rod E, provided with a shoulder *e*, crank F, bearing G, plates D D, runners *c c*, projection *g*, spring-bar *d*', and auxiliary springs *b b*, moving with the body A, all arranged and operating substantially as described.

411,721. SMOKE-COMPRESSOR. WILLIAM W. HARPER, Aveilles, Ohio. Filed Dec. 20, 1887. Serial No. 258,497. (No model.)

Claim.—An implement to compress corn or fodder for tying, consisting of the handle A, having secured to it the forwardly-extending plate B, the curved transverse plate C, secured to the forward ends of said plates and provided with the central slot *c* and hook D, the anti-friction roller E, journaled in bearings in the slot *c* opposite to the hook, the reel F, journaled in the plates B and having one of its flanges formed into a ratchet to engage the detent or latch J, the rope K, having its inner end secured to the reel F, passing through the slot *c*, and having secured to its outer end a ring L, for attachment to the hook D, substantially as specified.

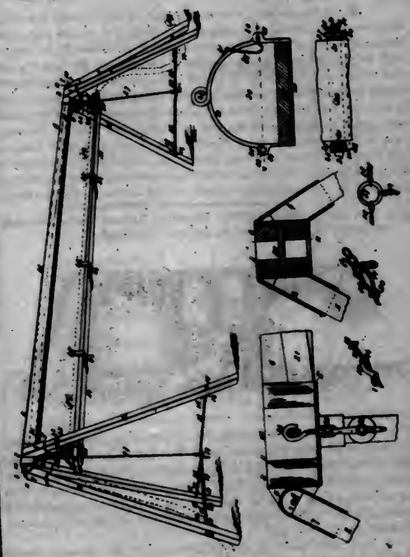
411,722. BIT-STOCK. GEORGE R. JACKSON and STILLMAN P. TAMER, Birmingham, Conn. Filed Apr. 27, 1889. Renewed July 26, 1889. Serial No. 318,003. (No model.)



Claim.—In a bit-stock, the combination, with the sliding sleeve, of the fixed jaw provided with the recess C and the shoulders or upstanding portions D E, forming a seat for the neck of a bit, and the movable jaw pivoted within the recess F and entering the recess C and having the tongue or extension H designed to enter between the upstanding portions D E and engage the bit-neck, substantially as specified.

411,723. METHOD OF FIXING BEER, &c. ADOLF G. JERSCHA, Gottlieben, and ADOLF BINDHARM, Bruntingen, Switzerland. Filed June 18, 1888. Serial No. 314,472. (No specimens.)

Claim.—The herein-described method of fixing fermented liquids or liquids undergoing fermentation, which consists in, first, saturating a suitable inert porous substance—such as burnt brick, for example—with the unfermented wort, and, secondly, immersing the porous substance so saturated into the fermented liquid or liquid undergoing fermentation, substantially as and for the purpose set forth.



411,724. HOSE-ELEVATOR FOR FIRE-ENGINES. ANDREW J. LOEBS, Brooklyn, N. Y. Filed Jan. 30, 1888. Serial No. 262,147. (No model.)

Claim.—1. The general arrangement of a central column B J C, subdivided into valve-chambers with valves R' R², and air-chamber M, supporting-beam W³, the whole forming a direct and continuous connection between suction and delivery consists A and D, in combination with pump-cylinders N and O, provided with connecting-connection E F G H, and buckets U' U², operated by rods T' T² from beam W³, and fitted with valves W and V², all constructed to operate substantially as and for the purpose set forth.

2. In combination with a central column B J C, provided with ball-valves R' R², two cylinders N and O, arranged with buckets U' U², fitted with double-beat valve W and relief-valve V², all constructed substantially as and for the purpose herein described.

411,725. HOSE-ELEVATOR OVER RAILROAD-TRACKS. THOMAS MCELHINEY, St. Louis, Mo. Filed July 23, 1889. Serial No. 318,218. (No model.)

Claim.—1. In a hose-elevator, the combination of the two tripods, the coupling-beam, the carry-beam that supports the hose, and the block and tackle suspended from the structure, by which hoisting-tackle the said carry-beam and hose are elevated, substantially as described, and for the purpose set forth.

2. In a hose-elevator, the combination of the stationary lateral tripod-legs, the pivotally-adjustable straddling rear legs, the coupling-beam, the metal heads having pendent sockets in which the tops of the lateral legs are seated and boxings in which the ends of the coupling-beam are seated, the projecting rear flanges 11, integral with said metal heads, the pivotal metal socket-heads 7, in which the tops of said adjustable rear legs are seated, and the pivot-pins 8, on which said metal heads 7 and the adjustable rear legs are journaled, substantially as described, and for the purpose set forth.

3. In a hose-elevator, the combination of the tripods constructed with stationary laterally-projecting legs and rear pivotally-adjustable legs and having metal socket-heads in which the legs of said tripods are seated, and the parallel longitudinally-separated sections of the coupling-beam seated in the metal boxings of the tripod-heads, and the block-and-tackle-supporting bars 23, the ends of which are secured in and couple the said sections of the beam, substantially as described, and for the purpose set forth.

4. In a hose-elevator, the combination of the tripods having metal socket-heads in which the legs are seated, the lateral socket-heads being stationary and the rear socket-head pivotally secured to said stationary part, the eyelet-bolts 12, secured to said legs, the straddle-chains 16, the outer ends of which are secured to the eyelets of said eyebolts, and the triple junction-ring 17, to which the inner ends of said straddle-chains are secured, substantially as described, and for the purpose set forth.

5. In a hose-elevator, the combination of the tripods with wooden legs and metal socket-heads, the lateral or side legs being stationary and the rear legs pivotally hinged to the other part of said head, the eyelet-bolts 12, secured to said legs, the spring-snaps that engage in said eyelets, the straddle-chains secured to said spring-snaps, the triple junction-ring 17, to which the straddle-chains from the lateral legs of the tripod are secured, the ring-linked adjusting-chain 19, secured to said junction-rings, the locking-hooks 18 on the inner terminal of the straddle-chain that connects the rear pivoted leg, and the loose mounted rings 20, that fasten the locking-hooks, substantially as described, and for the purpose set forth.

6. In a hose-elevator, the combination of the tripods, the longitudinally-sectional coupling-beam, the carry-beam 26, and the bail-hangers that carry said beam, the bail of said hanger being hinged at one end and lock-bolted at the other end to the carrier-hanger frame and suspended from said beam, substantially as described, and for the purpose set forth.

7. In a hose-elevator, the combination of the tripods, the coupling-beam that unites said tripods, the block and tackle suspended from said coupling-beam, the carrier-hanger hose-frames 35, the hinged bails from which said hanger-frames are suspended, the locking-pins that secure said bails in their closed position, the carry-beam seated in said hangers that carries the hose, and the studded brackets secured to said carry-beams that fence in the hose, the grab-hook of the block and tackle engaging with the bail of said hanger and the hoisting-rope of said tackle, thereby effecting the elevation of said hangers, said carry-beam, and said hose, said hoisting-rope being attachable to the triple junction-ring 17 to secure the retention of the elevation of said hose, &c., substantially as described, and for the purpose set forth.

411,726. BRICK-KILN. VALDEMAR HENRIS, Odense, Denmark. Filed Jan. 28, 1889. Serial No. 297,990. (No model.)

Claim.—1. In a brick-furnace, the combination of the firing-chamber, horizontal flues below the same, vertical ducts communicating with the horizontal flues and firing-chambers, collecting-flues communicating with the horizontal flues, a hot-air duct communicating with the collecting-flues, a hot-air chamber, and a valve for regulating the communication between the hot-air duct and the hot-air chamber, substantially as described.

2. In a brick-machine, the combination of the firing-chambers located at each end thereof, a hot-air duct communicating indirectly therewith, a hot-air chamber communicating with the said firing-chambers, and valves for connecting the hot-air ducts and hot-air chambers, substantially as described.

3. In a brick-machine, the combination of the firing-chambers located at each end thereof, a hot-air duct communicating indirectly therewith, a hot-air chamber communicating with the said firing-chambers, and valves for connecting the hot-air ducts and hot-air chambers, a smoke-collecting chamber extending parallel to the hot-air chamber, and a valve for connecting the hot-air duct and smoke-collecting chamber, substantially as described.

411,727. METAL-SHEARS. LOYAL C. HOUTS, Grimes, Iowa. Filed May 10, 1889. Serial No. 310,269. (No model.)

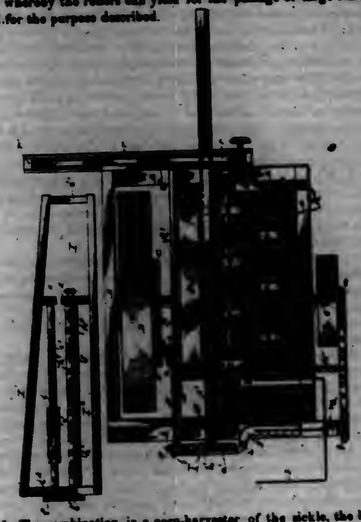
Claim.—1. In a metal-shearing machine, the herein-described base, composed of a lower portion having an upwardly and rearwardly inclined surface, and an upper portion rising from the edge of the lower portion and having a downwardly and rearwardly inclined lower surface, substantially as and for the purpose set forth.

2. In a metal-shearing machine, the combination, with the base composed of a lower portion and an upper portion extending upwardly from the edge of said lower portion, of a knife-carrying lever connected pivotally to the inner side of said upper portion, a flanged guard-plate secured to the upper end of the upper portion of the base, and a connecting-bolt extending transversely through the said guard-plate, knife-carrying lever, and the upper portion of the base, substantially as and for the purpose set forth.

3. In a metal-shearing machine, the combination of the base composed of a lower portion and an upper portion extending upwardly from the edge thereof and having a circular recess near its front end, the knife-carrying lever having a laterally-extending trunnion mounted in said recess, and a transverse connecting-bolt, substantially as herein described, and for the purpose set forth.

4. In a metal-shearing machine, the combination, with a base composed of a lower portion and an upper portion extending upwardly from the edge of the same and having a circular recess near its front end, of a knife-carrying lever having a laterally-extending trunnion mounted in said recess, a guard-plate having a laterally-extending flange bolted to the upper end of the base, and a transverse connecting-bolt extending through said guard-plate, knife-carrying lever, and the upper portion of the base, substantially as and for the purpose set forth.

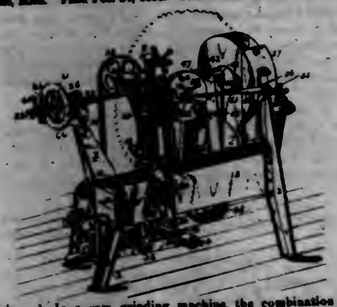
5. In a metal-shearing machine, the combination of the base composed of a lower portion having an upwardly and rearwardly inclined upper surface, and an upper portion extending vertically from the edge of said lower portion and having an upwardly and rearwardly inclined lower surface, and provided near its front end with a laterally-extending circular recess, the knife-carrying lever having a laterally-extending trunnion, the flanged guard-plate bolted to the upper end of the upper portion of the base, a connecting-bolt extending transversely through the guard-plate, the knife-carrying lever, and the upper portion of the base, an operating-lever connected pivotally with the rear end of the knife-carrying lever, and toggles connecting said operating-lever with the lug extending upwardly from the rear end of the base, substantially as and for the purpose herein shown and specified.



411,728. CORN-HARVESTING MACHINE. JAMES A. HOWDEN, Vail, Iowa, assignor of one-half to John A. Hines, same place, and Hugh Langan, Centreville, Dak. Filed May 6, 1889. Serial No. 309,677. (No model.)

Claim.—1. In a corn-harvesting machine, the combination, with the cutting apparatus, of the conveying-belts, the roller provided with grooves for the reception of said belts, the upper husking-roller having ribs such as described at intervals of its periphery, and the elongated frame-bars having bearings for the rear ends of said roller-shafts, said bars being arranged to yield, for the purpose set forth and described.

2. In a corn-harvesting machine, the combination of the elongated frame-bars arranged to yield near their center, with the ribbed husking-roller and a smooth husking-roller, both having bearings near the center of said yielding bars, as and for the purpose set forth.



3. In a combined corn harvesting and husking machine, the combination of the sickle, an endless-belt platform immediately in the rear of the sickle, husking-rollers arranged at right angles with the sickle and in a plane transverse to the movement of said belts, and the yielding frame carrying said husking-rollers, as set forth.

4. The combination, in a corn harvesting and husking machine, with the husking-rollers, of the yielding-frame bars provided with bearings for said rollers and having a passage between them for the stalks, whereby the rollers can yield for the passage of large stalks, as and for the purpose described.

5. The combination, in a corn-harvester of the sickle, the belts or chains, the yielding frame-bars, husking-rollers, the aprons for conveying away the corn ears and stalks, respectively, said aprons being parallel to each other and at right angles to the cornstalk receiving and feeding belts or chains, all operating together as set forth.

411,729. SAW-GRINDING MACHINE. WILLIS J. PERKINS, Grand Rapids, Mich. Filed Feb. 27, 1888. Serial No. 265,376. (No model.)

Claim.—1. In a saw-grinding machine, the combination of a movable saw-support, a tapering gage connected to and movable with the support and bearing directly on one face of the saw, and a grinding-wheel bearing on the face of the saw directly opposite the gage, substantially as described.

2. In a saw-grinding machine, a rotating grinder, a pivoted frame, a rotating shaft mounted on said frame at the end opposite the pivot, a saw-clamp on said shaft, and a shifter for swinging the frame toward and away from the grinder, substantially as stated.

3. In a saw-grinding machine, a rotating shaft and a spring-head thereon to which a saw may be affixed, a gage connected to said shaft, and a grinding-wheel in proximity to one face of the gage, substantially as described.

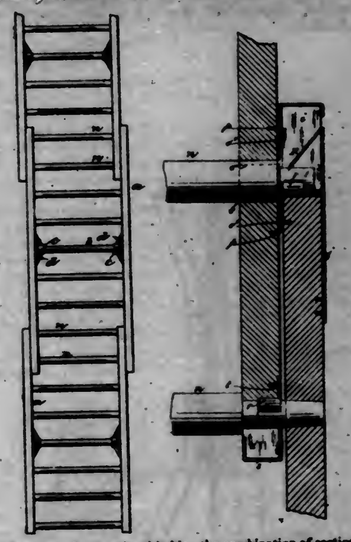
4. In a saw-grinding machine, the combination of a rotating shaft mounted in a swinging frame, a gage connected to said shaft so as to move with the swinging frame, and a grinding-wheel in proximity to the gage, all in combination, as set forth.

5. In a saw-grinding machine, the combination of a grinding-wheel, a gage or rest in proximity to the wheel, a rotating saw-carrying shaft and a shifter therefor, and a water-trough in which the lower part of the saw runs when shifted toward or farther from the grinding-wheel.

6. The combination, with a rotating saw-carrying shaft and a shifter therefor, of a plurality of rests at different elevations, against which rests one face of the saw bears, and a grinding-wheel operating against the other face of the saw, as set forth.

7. In a saw-grinder, a rotating saw-carrying shaft, a swinging frame on which said shaft is mounted, a screw-shaft connected with the frame, and a train of gears connected with the saw-carrying shaft and with the screw-shaft by which the swinging frame may be actuated as the saw is rotated, substantially as described.

8. The combination, in a saw-grinding machine, of a movable support bearing the saw, a gage having the face contour desired for the saw bearing directly on one face thereof, and a grinding-wheel bearing on the opposite face of the saw, whereby the gage determines the bevel of the saw, as set forth.



9. The combination, with a movable saw-support, of a beveled gage connected to said support in position to bear directly against one face of the saw, an adjustable bearing-piece serving as a support for said gage, and a grinding-wheel in position to operate on the face of the saw opposite the gage, substantially as described.

10. In a saw-grinding machine, the combination of a rotating grinding-wheel, a rotating saw-shaft, a trough in which the bottom of the saw runs, and a spout leading from the vicinity of the grinding-wheel to the trough, as set forth.

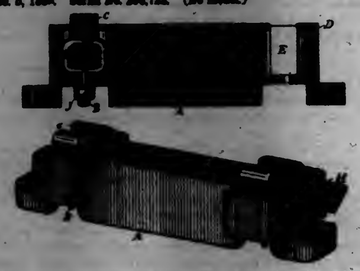
11. In a saw-grinder, the combination, with the rotating saw-carrying shaft and spring having a bearing-pressure against the saw, of the plurality of rests or bearings for the saw on the opposite side of the saw from the spring, as set forth.

12. The combination of the rotating saw-carrying shaft and a shifter therefor and a series of rests against which one face of the saw bears, an arm holding one of said rests, and a bolt holding said arm to the machine, substantially as described.

411,780. SECTIONAL LADDER. CALEB C. PERKINS, Elizabeth, N. J. Filed June 18, 1888. Serial No. 314,749. (No model.)

Claim.—1. In a sectional ladder, the combination of sections provided with slots in the ends of the sides of the sections, metallic bearings applied to the said slots, metallic rung-extension fitting in said bearings, and metallic springs pressing upon the said rung-extensions, the direction of pressure being in the direction of the length of the ladder.

2. In a ladder, the combination of collars applied to the opposite ends of the rungs of the ladder at the middle of the said ladder, and arms on said collar secured to the sides of the ladder.

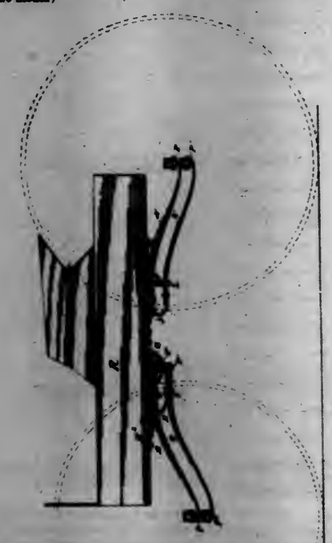


3. In a ladder, the combination of rungs, sides, and collars partially surrounding the middle rung, and arms connected to each collar and attached to the ladder-sides.

4. In a ladder, the combination, with the side of the ladder, of a rung-extension having arms which are attached to the ladder-sides.

5. In a ladder, the combination of ladder-sides provided with slots at the ends of the sides, the slot being formed by arms I and metallic

bearings in said slots, and having arms *s* secured to the ladder-sides and bent over the arms *i*.



411,781. SHAFTING-CHUCK. WINFIELD S. ROGERS, Cincinnati, Ohio, assignor to the Universal Radial Drill Company, same place. Filed Feb. 5, 1889. Serial No. 299,722. (No model.)

Claim.—1. In shafting chucks or vises, the combination, substantially as set forth, of a frame or body having a V-slot in the top part and having suitable recesses at proper intervals, clamping-jaws, and fastening devices engaging said jaws by which the article may be clamped upon the shaft, as shown.

2. In shafting chucks or vises, the combination, substantially as set forth, of a frame or body having a V-slot on the top part and carrying a loose V-shaped slide and having suitable recesses at proper intervals, clamping-jaws, and fastening devices engaging said jaws to draw downward and clamp the article to be worked, as shown.

411,782. SPRING-PLATFORM FOR ROAD-WAGONS. CYRUS W. BALDWIN, Cleveland, Ohio. Filed June 24, 1889. Serial No. 315,300. (No model.)

Claim.—1. In a spring-platform, the combination of a fifth-wheel placed in the rear of the front axle and secured to the bottom of the body, side springs diagonally extended from the fifth-wheel to the axle at or near the opposite shoulders thereof, and a longitudinally-arranged central spring also extended from said fifth-wheel to the axle, said side and central springs having their inner ends rigidly connected to the fifth-wheel and their outer ends pivotally connected to the axle in different horizontal planes, substantially as and for the purpose set forth.

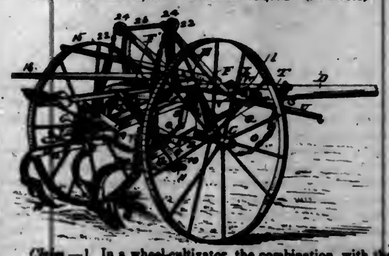
2. In a rear spring-platform for road-wagons, the combination, with the bottom of the body and the hind axle, side springs radially extended from the bottom to the axle at widely-separated points, a longitudinally-arranged central spring also extended from the bottom of said body to the axle, the outer ends of said side and central springs being pivotally connected to the axle, their inner ends rigidly secured in relation to the bottom of the body, and having both ends of said central springs suspended in a lower plane than the side springs, whereby to prevent the rotation of the axle by the vibration of the springs, substantially as set forth.

3. In a spring platform of the character described, the combination of a fifth-wheel placed in the rear of the front axle, provided with an upper plate secured to the bottom of the body, a lower plate provided with a pivotal boss on its bottom surface, a brace or hanger attached to the bottom frame of the body and provided with a central bearing adapted to support the pivotal boss and lower plate, a flanged spool passing through the upper plate, and a bolt extended through said spool, lower plate, and hanger, substantially as set forth.

4. In a spring-platform, a fifth-wheel provided with an upper fixed plate, a brace or hanger extending over the pivotal point of the wheel, a spool passed through said upper plate and resting upon its under plate at its pivotal point, and a bolt passing through the spool, lower plate, and hanger, substantially as described.

5. In a spring-platform of the character described, a fifth-wheel secured to the bottom of the body, a hanger extended over the pivotal center of the wheel and connected with the upper plate and the body, the lower plate of said wheel being pivoted between the upper plate and hanger, and a safety-hook at the front portion of said fifth-wheel, substantially as set forth.

6. In a spring-platform of the character described, a fifth-wheel secured to the bottom of the body, a hanger extending over the pivotal center of said wheel, its lower plate pivoted between the upper plate and hanger, and springs rigidly attached to the lower plate and extending radially therefrom to the axle, substantially as set forth.



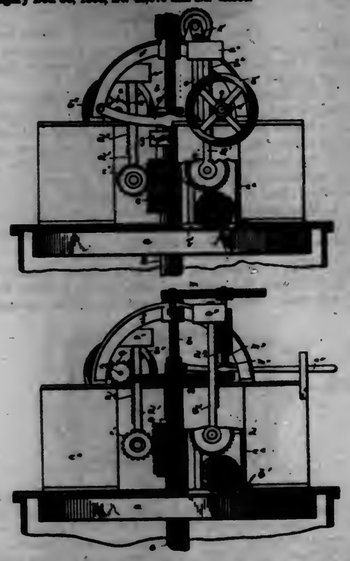
7. In a rear spring-platform, a plate rigidly attached to the bottom frame of the wagon-body and side springs rigidly attached to said plate and extending radially therefrom to the axle at or near its shoulders, in combination with a longitudinal central spring attached to the plate by a loop in one of its leaves at the inner end and a spool and bolt placed to the rear end of the loop, substantially as described.

8. In a spring-platform, a central spring having its inner end attached to the pivot of the fifth-wheel, one or more of its leaves being bent upward and attached to the lower plate of the wheel, in combination with side springs directly attached to said lower plate and a hanger and bolt securing the lower plate and springs to the bottom frame of the body, substantially as described.

9. In a spring-platform of the character described, a fifth-wheel provided with an upper fixed plate, and a lower plate provided with stops on its periphery located equidistant from the center and in front, in combination with a centrally-located safety-hook rigidly fixed in relation to bottom of the body, extended over the lower plate of the wheel, and adapted to engage the stops on said plate, substantially as set forth.

10. In a road-wagon, a fifth-wheel consisting of two plates secured to the bottom of the body, each plate being provided with a central hub and radial arms extending from the hub to the periphery, said arms in the lower plate being adapted to receive the inner ends of springs extending thence to the axle, substantially as set forth.

411,738. WHEEL-CULTIVATOR. HALLECK O. SANDERS, Madison, Wis. Filed June 15, 1889. Serial No. 314,294. (No model.)



Claim.—1. In a wheel-cultivator, the combination, with the cultivator-beam, the arched axle, the inclined guard-bearing, and the transverse shifting-rod, of the universal sleeve on said shifting-rod, the bifurcated shifting-lever engaging the universal sleeve and engaging also the notched axle of the cultivator-beam connected to the universal sleeve, the arc-rack at the rear end of the cultivator-beam, the lever pivoted to the cultivator-beam and provided with the front bent end and the detent at its rear end, the hinged cultivator-shank connected to the pivoted lever by a slotted link-arm, and transverse pins, substantially as specified.

2. In a wheel-cultivator, the combination, with the main frame,

of the laterally-movable universal sleeve and its shifting-lever, the cultivator-beam connected thereto by a vertical rod having a wear-plate at its upper end, the segmental rack secured to the rear end of the cultivator-beam, the pivoted cultivator-shank on the rear of the cultivator-beam, the pivoted lever having the bifurcated downwardly-bent front end and the spring-detent at its rear end, the slotted link connecting the hinged lever to the pivoted cultivator-beam, the vertical racks connected at their upper ends and provided with pulleys, the lifting-levers provided with the laterally-projecting arms for engaging the vertical racks, and the chains connecting the lifting-levers with the cultivator-beams, substantially as specified.

411,784. APPARATUS FOR GRINDING WOOD. FRIEDRICH H. SENNING, Schleifenwerk, near Rudau, Saxony, Germany. Filed Nov. 27, 1888. Serial No. 292,694. (No model.) Patented in Germany June 6, 1888, No. 46,645; in Norway Aug. 31, 1888, No. 1,079, and in Austria-Hungary Dec. 20, 1888, No. 44,070 and No. 45,893.

Claim.—1. A wood-reducing machine comprising a horizontal rotary grinder mounted on a spindle, a box to receive the wood and allow it to rest upon the face of the grinder, and gearing connected with and actuated by the grinder-spindle and adapted to engage the wood block in the box and hold the block upon the grinder and turn the block, whereby the periphery of the block is uniformly reduced, substantially as described.

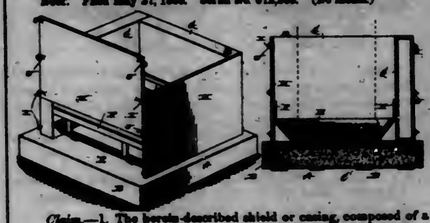
2. A wood-reducing machine provided with a toothed roll adapted to hold a block of wood against the grinder and turn or rotate the wood, so that no greater than a certain fixed width of grinding-surface on the periphery of the block shall be reached, substantially as described.

3. A wood-reducing machine comprising a horizontal grinder, a box to receive a block of wood and allow the same to rest upon the grinder, and one or more rotary toothed rolls to hold the block against the grinder and turn the wood, for the purpose set forth.

4. In a wood-reducing machine, the combination of a weighted rod to hold a block of wood against the grinder and gearing partially carried by and moving with the rod to turn the block upon its longitudinal axis, whereby a fine long uniform fiber is produced, substantially as described.

5. In a wood-reducing machine, the combination of a vertically-movable weighted rod, a toothed roll mounted upon the lower end of the same and adapted to engage a block of wood and hold the same against the grinder, and gearing to rotate said roll and thereby turn the block, substantially as described.

6. In a wood-grinder, a horizontal rotary grinder, in combination with a vertically-movable weighted rod adapted to hold a block of wood upon the upper face of the grinder and gearing to rotate said block upon its longitudinal axis, whereby the periphery of the wood will be uniformly reduced, substantially as described.



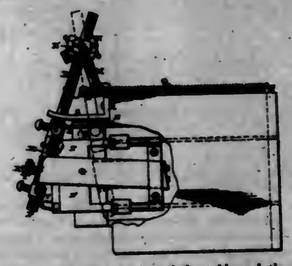
7. In a wood-grinder, the combination, with a horizontal rotary grinder, of one or more vertically-movable rods adapted to press a block of wood upon the face of the grinder, rotary means carried by the same to engage the wood and hold the same against the grinder and rotate the wood on its horizontal axis, and gearing to rotate said means, substantially as described.

8. In a wood-grinder, a horizontal rotary grinder and a box having an open bottom above the grinder and adapted to receive and retain a block of wood on the face of the grinder, in combination with a vertically-movable weighted rod in the box to hold the wood upon the face of the grinder and provided with a vertical rack, and a shaft provided with a gear engaging said rack and adapted to raise the rod, substantially as described.

9. In a wood-reducing machine, the combination of a toothed roll to engage a block of wood and hold the same in engagement with the grinder, a worm-gear to rotate said roll, and a worm on the grinder-spindle to rotate said gear, substantially as described.

10. In a wood-reducing machine, the combination of a vertically-movable weighted rod, means for raising the same, a toothed roll upon the lower end of the same to engage a block of wood and hold the same against the grinder, a worm-gear carried by the rod to rotate the roll, the grinder-spindle, a worm on the same to rotate said gear, and means for throwing the worm into or out of gear with the spindle, substantially as described.

411,785. GUARD FOR STOVES. GEORGE W. SLAWSON, Davenport, Iowa. Filed May 27, 1889. Serial No. 312,203. (No model.)



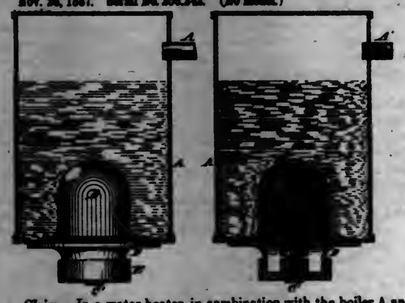
Claim.—1. The herein-described shield or casing, composed of a series of sections connected separably by means of suitable hinge-connections, substantially as set forth.

2. The herein-described shield or casing, consisting of a flat vertical tank or tanks and plates connected together adjustably and separably by hinge-connections and adapted to be mounted upon a suitable base around a stove supported upon said base, substantially as set forth.

3. The combination, with the base, of the shield or casing mounted upon said base and composed of the sections provided at their ends with hooks and eyes, by means of which they may be connected adjustably and separably, substantially as and for the purpose set forth.

4. The combination of the base, the tanks or hollow casing-sections mounted upon said base, and the feeder-plates, said hollow casing-sections and feeder-plates being provided with hooks and eyes, whereby the latter are rendered vertically adjustable and detachable, substantially as and for the purpose set forth.

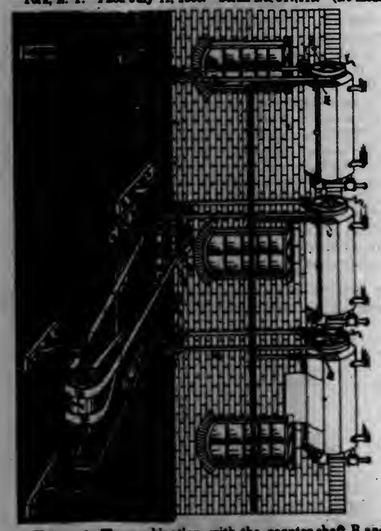
411,786. CIGAR-BUNCHING MACHINE. FREDERIC C. SHALDEN, Allegheny, Pa. Filed Jan. 30, 1889. Serial No. 297,992. (Model.)



Claim.—1. The combination of the table and the apron with a spring-actuated pivoted lever, the bunching-roll placed upon the lever, the adjusting devices placed upon the lever for holding the roller in any desired position, and a treadle mechanism for moving the rod or lever through a portion of a circle, substantially as set forth.

2. The combination of the frame A, the casting secured thereto, a supporting-frame L, mounted upon the casting, an adjustable bearing or support mounted upon the frame, a pivoted box or bearing, a spring-actuated lever P, which passes through the box or bearing, a bench-

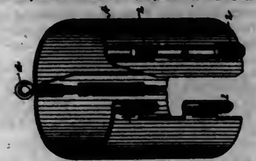
ing-roller placed upon the lever, the table, the apron, and treadle mechanism for moving the rod or lever, substantially as specified.



3. The combination of the table and the apron with the bunching-roller, the lever upon which the bunching-roller is placed, a treadle mechanism for moving the lever, a spring for returning the lever to position, the pivoted box or bearing through which the rod or lever passes, and a suitable casing provided with projecting arms for holding the lever in position, substantially as shown.

411,787. ELECTRIC WATER-HEATER. DANIEL W. SMITH, St. Louis, Mo., assignor of one-half to Joseph C. Addington, same place. Filed Nov. 26, 1887. Serial No. 256,343. (No model.)

Claim.—In a water-heater, in combination with the boiler A and a metallic dome or housing B, located therein, a steam-pipe A', connected with said boiler, and an independently-inclosed electric heater F, having a metallic casing C, secured in dome B by means of a downwardly-projecting flange D and a collar E, screwed thereon, all substantially as and for the purpose herein set forth.

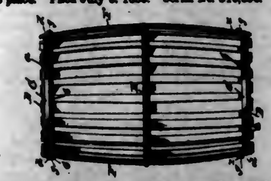


411,788. REVERSING-BELT GEAR. HAMILTON E. SMITH, New York, N. Y. Filed July 11, 1888. Serial No. 317,119. (No model.)

Claim.—1. The combination, with the counter-shaft B and with an automatic reversing-belt gear constructed to change the direction in which the counter-shaft turns automatically after a certain fixed number of revolutions, of a set of fast and loose pulleys *b b'*, mounted on the counter-shaft B, a set of fast and loose pulleys *c c'*, mounted on the shaft S of a working machine, the belt C, the belt-shifting slide K, constructed to engage both branches of the belt C, the upright shaft N, the handle *n*, the arm *n'*, the pit *n²*, and the head *k'*, secured to the slide K and engaging the pin *n²*, substantially as described.

2. The combination, with a counter-shaft B and with an automatic belt-gear constructed to change the direction in which the counter-shaft turns automatically after a certain fixed number of revolutions, of a set of fast and loose pulleys *b b'*, mounted on the counter-shaft B, a set of fast and loose pulleys *c c'*, mounted on the shaft S of a working machine, the belt C, the belt-shifting slide K, constructed to engage both branches of the belt C, the upright shaft N, the handle *n*, the arm *n'*, the pit *n²*, and the head *k'*, secured to the slide K and engaging the pin *n²*, substantially as described.

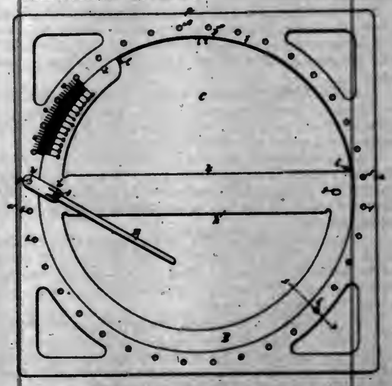
411,739. FLOWER-POT. JULIUS H. TRAYER, Mount Pleasant, N. C. Filed Dec. 22, 1888. Serial No. 294,412. (No model.)



Claim.—1. A flower-pot made of a piece of suitable metal, provided on one edge with downward-extending lugs adapted to fit in grooves or recesses formed on the opposite edge, whereby the pot will be held together, substantially as described.

2. The combination, with the flower-pot, one edge of which is provided with downward-extending lugs adapted to fit in grooves or recesses formed in the opposite edge, of a pin engaging the said openings for holding the pot securely together, substantially as described.

3. The combination, with the pot having inclined slits near the lower end thereof, of a bottom having arms adapted to engage the slits, substantially as and for the purpose specified.

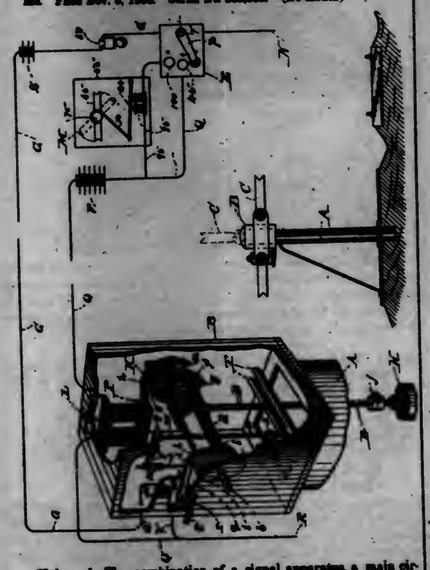


4. The combination, with the pot having inclined slits near the lower end thereof, of a perforated bottom having arms adapted to engage the slits, substantially as described.

411,740. FRUIT OR VEGETABLE CRATE. THOMAS B. ASHFORD, Kinston, N. C., assignor of three-fourths to Henry B. Harper, same place. Filed July 8, 1889. Serial No. 316,858. (No model.)

Claim.—The combination, with a central partition and heads of less diameter than the partition, of staves secured to the central partition and at their ends sprang inward and secured to the heads, and the binding-wires passed around the staves near their attachment to the heads between said attachment and the central partition and drawn tight, the staves being thereby drawn inward, as shown at X, the ends of the wires being twisted to prevent springing of the ends of the staves from the heads, substantially as shown and described.

411,741. PROTRACTOR. CHARLES R. W. DOW, Providence, R. I., assignor to Darling, Brown & Sharpe, same place. Filed Dec. 3, 1888. Serial No. 292,537. (No model.)



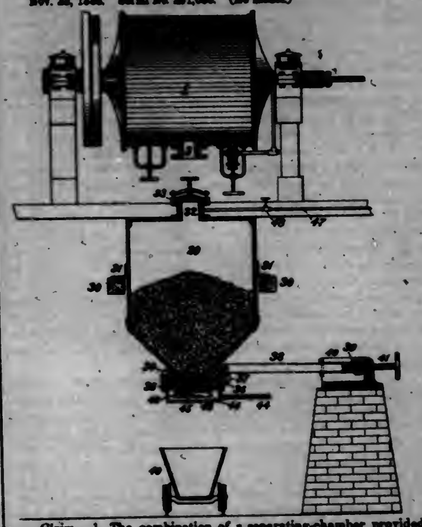
Claim.—1. A protractor having in combination a frame provided with a grooved circular opening and an arc having a grooved edge and fitting the circular opening of the frame, with a wire inserted into the groove between the arc and frame, substantially as described.

2. A reversible protractor having in combination a frame provided with a circular opening and with four sides at right angles to each other, and an arc fitting the circular opening and adapted to make a complete revolution within the said opening, substantially as described.

3. In a protractor, the combination, with a frame provided with a circular opening and an arc fitting the circular opening of the frame, the frame and arc being provided with adjusting-holes, of the adjusting-lever provided with pins adapted to enter the holes of the arc and frame, substantially as described.

411,742. RAILWAY-SIGNAL. ALONZO B. FOX, Whitinsville, Mass., assignor to the Gould-Tisdale Receiving Semaphore Company, Portland, Me. Filed Nov. 3, 1888. Serial No. 289,955. (No model.)

Claim.—1. The combination of a signal apparatus, a main circuit, an electro-magnet in said circuit in connection with said apparatus for controlling it, an auxiliary circuit having an alarm, an indicator, a supplemental wire connecting said indicator with the main circuit, a switch-board having two contact-studs adjacent to each other, one being connected with the main circuit and the other with said supplemental wire, a switch-key connected with the auxiliary circuit, and a circuit-changer connected with the main circuit and actuated by the signal apparatus to unite both circuits when the signal apparatus is actuated.

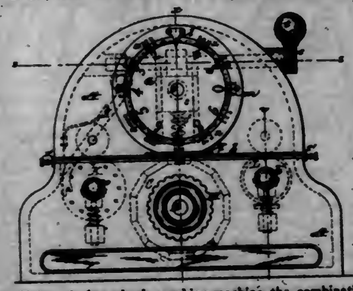


2. The combination of a shaft, a signal operated thereby, an actuator for rotating said shaft, an escapement for controlling the movement of said shaft, a main circuit, an electro-magnet in the main circuit for releasing the escapement, an auxiliary circuit, a pivoted arm connected with the main circuit, and a cam-wheel on said shaft engaging said arm and lifting it to unite both circuits when the shaft is turned.

3. In a semaphore-signal device, the combination of the post A, the shaft *b* in said post bearing the semaphore-arm, scape-wheel *f*, and check-wheel *h*, the retaining-pawl K, in engagement with the scape-wheel, an electro-magnet for releasing the same, a cord in said shaft provided with a weight, the pivoted bar *g*, in engagement with said check-wheel, and the insulated spring 25, connected with an auxiliary electric circuit, whereby a bell may be rung when said bar is elevated to enable the semaphore-shaft to be wound, substantially as described.

4. In a semaphore-signal device, a lever *y*, and pivoted bar *w*, provided with the forked bar T, in combination with the semaphore-shaft *b*, provided with the check-wheel *h*, the pivoted bar *g*, in engagement with said wheel, the pin *z*, fitted to slide in said lever and having the check-nut 16, and the cord D on said shaft, provided with the weight H and check-nut *j*, whereby said nut will engage the forked bar and force the pivoted bar *g* into engagement with the check-wheel after the cord has been wound onto said shaft, substantially as set forth.

5. In a semaphore-signal device, the combination of the post A, the shaft *b*, bearing the arm C, scape-wheel *f*, and check-wheel *h*, the cord D, provided with the weight H, and check-nut *j*, the pawl K, provided with the armature P, the magnet L in the main-line wire Q, the pivoted bar *g*, the branch wire *v*, the lever *y*, and rod *w*, provided with the forked bar T, the pin *z*, fitted to slide in said lever and provided with the nut 16, the insulated spring 25, connected with the auxiliary-line wire G, provided with the bell 50, the indicator M, operated by a magnet in a branch wire 15, and the switch E, all being combined and arranged to operate substantially as described.



411,743. FILTERING APPARATUS. GEORGE W. GOSS, Pittsburg, Pa., assignor to the Ore Reduction Company, same place. Filed Nov. 28, 1888. Serial No. 291,686. (No model.)

Claim.—1. The combination of a separating-chamber provided with an upper charging-opening and door and a lower discharge-opening, a movable filter-box hinged or pivoted to the chamber in position to cover and uncover the discharge-opening, and a fluid-pressure supply-pipe leading into the chamber above the normal level of charge, substantially as set forth.

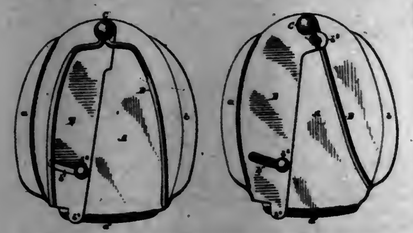
2. The combination of a separating-chamber provided with an upper charging-opening and door and a lower discharge-opening, a movable filter-box hinged or pivoted to the chamber in position to cover and uncover the discharge-opening, a fluid-discharge chamber provided with a discharge-pipe and communicating at top with the filter-box, and a fluid-pressure supply-pipe leading into the separating-chamber above the normal level of charge, substantially as set forth.

411,744. CHECK-PUNCHING MACHINE. WINSLOW W. GUPTILL, Boston, Mass. Filed Dec. 3, 1888. Serial No. 292,809. (No model.)

Claim.—1. In a check-punching machine, the combination of a rotary wheel provided with a series of dies and a rotary wheel carry-

ing a series of punches corresponding to said dies and having a movement toward and from said die-wheel, said die and punch wheels being mounted on shafts connected by gears, substantially as and for the purpose set forth.

2. In a check-punching machine, a rotary wheel carrying a series of punches and mounted on a shaft supported at its front end in a vertically-sliding box or bearing, said wheel having figures on its front side to indicate the positions of the punches, in combination with a rotary wheel having a series of dies corresponding to the punches and mounted on a shaft geared to the shaft of the punch-wheel, whereby the two wheels are adapted to be rotated simultaneously by hand, a feed-table for supporting the check to be punched, a lever for depressing the punch-wheel to cause the punches carried thereby to pass through the paper, and a feeding device for moving the check after each figure has been punched out, substantially as set forth.

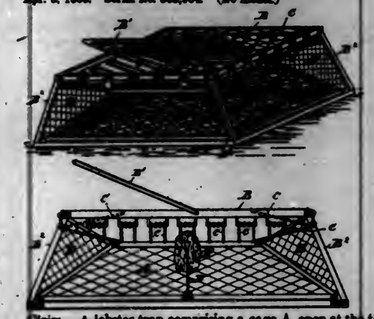


3. In a check-punching machine, a rotary wheel mounted on a horizontal shaft and having a series of straight faces, each provided with a removable die-plate, in combination with a rotary wheel carrying a series of punches and having a movement toward and from said die-wheel, said punch-wheel being mounted on a shaft geared at its rear end to the shaft of the die-wheel, a feed table or support, a stripper-plate or clearer placed between the punch and die wheels, and a feeding device for moving the check after each operation of the punch, all constructed and arranged to operate substantially as described.

4. In a check-punching machine, the combination of a rotary wheel carrying a series of removable dies and provided with a knob or hand-wheel for turning the same, a rotary wheel carrying a series of punches and having a movement toward and from the die-wheel, said die and punch wheels being mounted on shafts connected at their rear ends by gears, a hand-lever for depressing the punch-wheel, a spring for raising the same after each depression, a feed-table for supporting the check, a stripper-plate or clearer placed between the die and punch wheels, a printing device consisting of a printing-roll, a pressure-roll acting in conjunction therewith, and an inking device, the shaft of said printing-roll yielding downwardly and being adapted to be depressed by the hand to admit the check between the two rolls, and a feeding device for moving the check after each figure has been punched out, substantially as set forth.

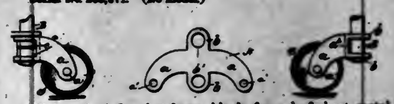
5. In a check-punching machine, the combination of a rotary wheel carrying a series of removable dies and provided with a knob or hand-wheel for turning the same, a rotary wheel carrying a series of punches and having a movement toward and from the die-wheel, said die and punch wheels being mounted on shafts connected at their rear ends by gears, a shaft *r*, provided with a hand-lever *s* and having an arm *u*, bearing on the vertically-sliding box *c* of the shaft D of the punch-wheel G, and adapted to depress said wheel, and an arm or lever *s'*, connected with and operating the feeding device for moving the check after each figure has been punched out, substantially as set forth.

6. In a check-punching machine, the combination, with the rotary punch and die wheels operating substantially as described, of the printing device consisting of the printing and impression rolls L *l'*, the former mounted on a spring-supported downwardly-yielding shaft *k'*, adapted to be depressed by hand to allow of the introduction of the check between said rolls, and an inking device for the printing-roll, substantially as set forth.



411,745. HOOF-PAD. ARTHUR D. HAMLIN, Portland, Me., assignor to Dennis A. Meaher, same place. Filed Jan. 26, 1887. Serial No. 225,563. (No model.)

Claim.—1. The herein-described snow-plate or protector comprising the imperforate larger lower plate A, of suitable size to fill the entire space within a horseshoe and having the flange *b* and the curved rear edge *a'*, the smaller upper plate B, provided with the flange *a*, the slot *b'*, concentric with the pivot, the lip *b²* to hold down the spring, and the curved extension *b³*, lying upon the curved edge *a'* and moving thereon, the bolt *b⁴*, the pivot or bolt C, connecting said plates near their front ends, and the spring D, attached to said pivot and with its free ends bearing against the flanges *a b*, substantially as and for the purpose specified.

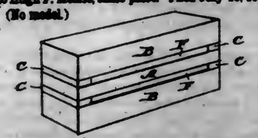


2. The imperforate plate A, of suitable size to fill the space inside the horseshoe, and having its lower end bent at *a'*, and a headed bolt *b³*, combined with the smaller plate B, pivoted to and moving over said plate A and slotted at *b'* and having the bent finger-piece *b⁴* resting on and moving over the end *a'* of the larger plate, and the spring D, substantially as described.

411,746. LOBSTER-TRAP. GEORGE HUME, Cape, Nova Scotia, Canada, assignor of one-half to Henry L. Forbes, Raymond, Me. Filed Apr. 3, 1889. Serial No. 305,904. (No model.)

Claim.—A lobster-trap comprising a cage A, open at the top and having upwardly-converging sides, a top B, elevated above the cage and projecting over the sides, fingers C, hinged to said top and falling across the top edge of the cage to close the entrance, and wings E, leading up to the entrance, as set forth.

411,747. CASTER. WILLIAM LIVINGSTONE, Jersey City, assignor of one-half to John Toler, trustee, Newark, N. J. Filed Sept. 16, 1888. Serial No. 286,671. (No model.)



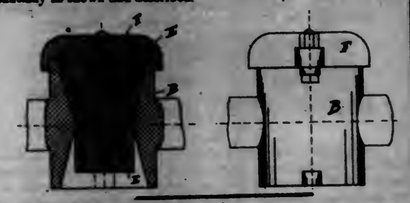
Claim.—1. A bracket-frame blank formed of sheet metal and provided with two laterally-projecting arms adapted to form the supporting-limbs of a caster, and also provided with two perforated ears adapted to form the upper and lower bearings for a pintle, substantially as set forth.

2. In a caster, a sheet-metal bracket-frame having its limbs bent parallel and provided with perforated bent ears or wings adapted to receive and support a pintle, substantially as set forth.

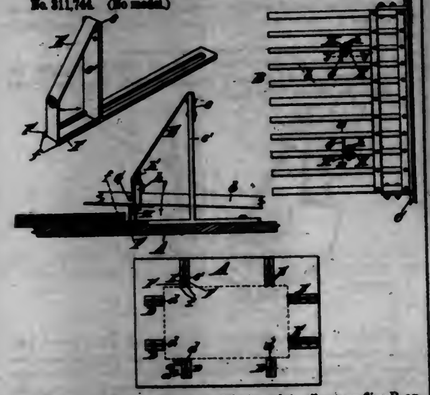
3. In a caster, the combination, with a sheet-metal plate having perforated ears formed integral therewith, of a tubular bearing located between the ears, substantially as set forth.

4. In a caster, the combination, with a pintle and a bracket-frame having perforated ears and provided with tubular extensions that lie between these ears, and also provided with parallel limbs integral with the ears, of a caster-wheel mounted to rotate between the limbs of the bracket-frame, substantially as set forth.

411,748. FAGOT. THOMAS MERKLE, Louisville, Ky., assignor of one-half to Hugh P. Meikle, same place. Filed July 13, 1888. Serial No. 317,866. (No model.)



Claim.—1. A fagot composed of a plurality of pieces of iron and steel having interposed between them pieces by which the former are separated to produce heating-flues, substantially as set forth.



2. In a fagot, the combination, with the central pieces A, of iron, of the exterior pieces B, of steel, and the interposed strips C, arranged to produce flues F, substantially as set forth.

411,749. ELECTRIC INSULATOR. LOUIS STEARNS, Boston, Mass., assignor to the Gould & Watson Company, of Massachusetts, and Charles Tennant Lee, Boston, Mass. Filed Aug. 13, 1888. Serial No. 282,474. (No model.)

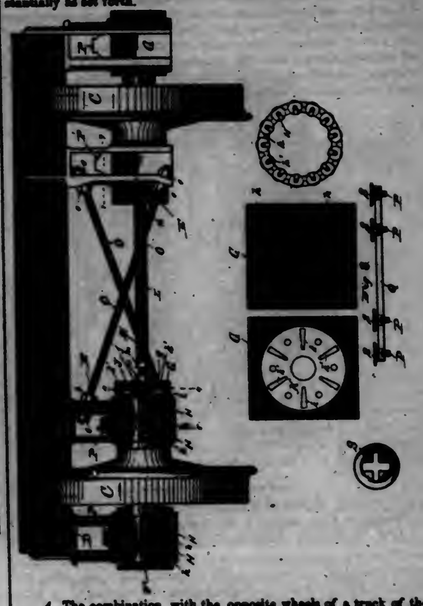
Claim.—An insulator comprising a block having an enlarged end and flaring or beveled sides, a frame or support having an aperture beveled or flaring at either end, whereby the frame may be reversed and the block inserted at either end of the aperture, a cap adapted to be secured to either side of the frame, and a layer of insulating material interposed between the block and the frame and cap, substantially as shown and described.

411,750. PAPER-JOGGER. WILLIAM RENDTEL, Cincinnati, Ohio, assignor to Andrew Van Ritter, same place. Filed May 22, 1888. Serial No. 311,744. (No model.)

Claim.—1. The combination of fly-board A, vibratory flier B, angular guides D on said fly-board, pendent spring-jogger E, mounted on suitable supports, also on said fly-board, strike-bars G on said flier, and sheet gages or stops H, also on said flier, constructed, arranged, and adapted to operate substantially as and for the purpose specified.

2. A paper-jogger composed of a pendent spring E, attached at its upper end to an upright *d'*, having a slotted foot or base plate, through which latter is passed a set-screw into the fly-board to adjustably and detachably secure the device in position, substantially as herein set forth.

3. The combination, with the resilient paper-jogger E and its supporting frame or standard, of the toes or bars F, having a suitable space or opening between them, and their outer ends beveled, substantially as and for the purpose specified.



4. The combination, with the flier B, having fingers *b*, of two or more right-angled or bent gage-plates or sheet-holders H, open boxes or square clamp-collars A, slid upon and encompassing said fingers and one limb of each of said plates, and thumbscrews *h'*, whose shanks pass through the upper cross-bars of said boxes *h* and engage the upper faces of said fingers, substantially in the manner and for the purpose specified.

411,751. CAR-TRUCK. SAMUEL W. TANNER, Chicago, Ill., assignor to the Tanner Anti-Friction Wheel Company, same place. Filed Jan. 19, 1889. Serial No. 296,815. (No model.)

Claim.—1. In a truck the wheels whereof are provided with independent axles and bearings at each end of each axles, the combination, with the inner axle-journal, of a box provided with an anti-friction end-thrust-resisting device, substantially as specified.

2. In a truck the wheels whereof are provided with independent axles and bearings at each end of each axles, the combination, with the inner axle-journal, of a box provided with an anti-friction bearing and an anti-friction end-thrust-resisting device, substantially as set forth.

3. The combination, with the opposite wheels of a truck of the kind herein shown, of a brace extending from the box of one wheel to the box of the opposite wheel in the axial lines of the wheels, substantially as set forth.

4. The combination, with the opposite wheels of a truck of the kind herein shown, of an adjustable brace extending from the box of one wheel to the box of the opposite wheel in the axial line of the wheels, substantially as specified.

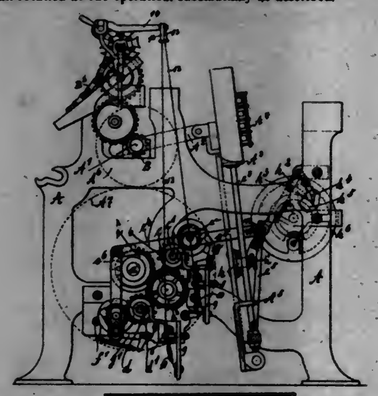
5. The combination, with the opposite wheels of a truck of the kind herein shown, of adjustable braces extending diagonally from the inner pedestal of one wheel to the inner pedestal of the opposite wheel, substantially as set forth.

6. The combination of the opposite wheels of a truck of the kind herein shown, adjustable braces extending diagonally from the inner pedestal of one wheel to the inner pedestal of the opposite wheel, each brace being also adapted to resist strains in both directions, substantially as set forth.

7. In a truck of the kind herein shown, the equalising-bars at both sides of the truck and the cross-bars uniting them, combined and operating substantially as set forth.

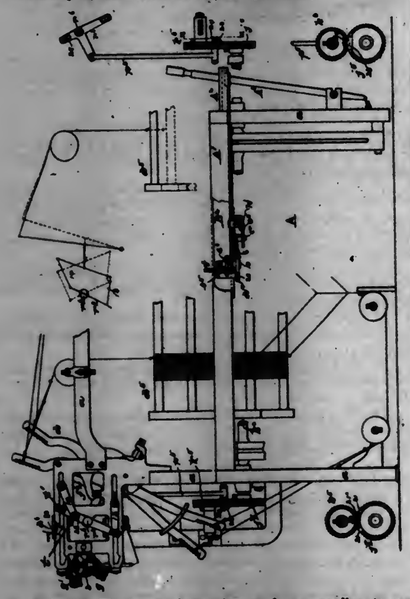
8. The truck of the kind herein shown, wherein the equalising-bars at both sides of the truck are tied together, substantially as set forth.

9. The combination, with the equalising-bars and the cross-bars uniting them, of the springs R, located at the junction of said bars, substantially as set forth.



10. The combination, with the equalising-bars and the cross-bars uniting them, of the springs R, and the metal seats for each springs spanning the junctions of the bars, substantially as set forth.

411,752. SHUTTLE-BOX MECHANISM FOR LOOMS. HORACE WYMAN, Worcester, Mass., assignor of one-half to the Crompton Loom Works, same place. Filed July 2, 1888. Serial No. 278,316. (No model.)



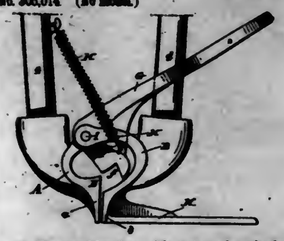
Claim.—1. A series of shuttle-boxes, a lever to move the same, a crank and eccentric, shuttle-box-shifting gears having long and short teeth and connected with the crank and eccentric, the intermittingly-moving driving-gear, and indicating-gears located intermediate the said driving-gear and shifting-gears and actuated by the driving-gear to impart to the said shifting-gears a half-rotation and then run out of mesh therewith and leave the said shifting-gears at rest, combined with means to change the relative positions of the said gears longitudinally in the direction of their axes of rotation to again enable the shifting-gears to be started and partially rotated, substantially as described.

2. A series of shuttle-boxes, a lever to move the same, a crank and eccentric, shuttle box-shifting gears attached thereto and having long and short teeth, the intermittingly-moving driving-gear, and indicating-gears located intermediate the said driving-gear and shifting-

gears, and actuated by the driving-gear to impart to the said shifting-gears a half-rotation and then run out of mesh therewith and leave the said shifting-gears at rest, combined with means to change the relative positions of the said gears longitudinally in the direction of their axes of rotation to again enable the shifting-gears to be started and partially rotated, and with stopping devices carried by the said indicating and shifting gears to prevent the latter making more than a half-rotation at one operation, substantially as described.

411,753. SHEDDING MECHANISM FOR LOOMS. HORACE WYMAN, Worcester, Mass., assignor to the Crompton Loom Works, same place. Filed July 12, 1888. Serial No. 279,753. (No model.)

Claim.—1. The harness-levers, harness-frames, cording to connect the said levers and frames, two hooked jacks in operative connection with each harness-lever, two reversely-moving lifters, a rock-shaft having arms or levers, and means to connect the said lifters and arms at different distances from the center of the rock-shaft to thereby move said lifters over unequal distances, as described, and a pattern device whereby the harness-frames are moved to bring all the warps into the same plane before the formation of each shed, substantially as described.



2. The shaft J^2, the gear j^2, having two teeth 21, with a space between them, and a projection 23, and the gear J^3, having an isolated tooth 20, and two spaces, one at each side, a flange 24, combined with the harness-frames, harness-levers, connected cording, connected hooked jacks, lifters, and means between the said gear J^3 and lifters to reciprocate them, the said gear and lifters having a slight dwell during each rotation of the crank-shaft to afford more time for the passage of the shuttle through the shed, substantially as described.

411,754. BALANCED SLIDE-VALVE. JAMES C. AMBERG, Bedford, Iowa. Filed Dec. 21, 1888. Serial No. 294,230. (No model.)

Claim.—The combination of the slide-valve, the circular countersunk disk secured on the upper side of the same, the packing-disk seated in said countersunk disk, the packing-ring surrounding the latter, the springs interposed between the circular countersunk disk and the body of the valve and having upturned ends bearing against the under side of the packing-ring, and the hood or cap having longitudinal supporting-ribs and provided on its upper side with a spring pressing against the under side of the top of the valve-chest, substantially as set forth.

411,755. ROOFING-TONGS. THOMAS R. BENNETT, Wilmington, Del., assignor of one-half to Robert H. Jones, same place. Filed Mar. 27, 1889. Serial No. 305,014. (No model.)

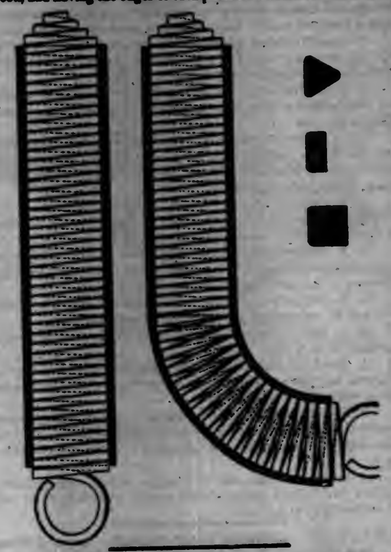
Claim.—1. The combination, with two main gripping-jaws having curved inner surfaces and straight gripping-faces, of an inner jaw adapted to sweep over said curved inner surface to bend over the edge of the metal, said gripping-jaws and inner jaw being pivoted together in line with each other and all out of plumb with the bite of the gripping-faces of the gripping-jaws.

2. The combination, with two main gripping-jaws having curved inner surfaces and straight gripping-faces, of an inner jaw adapted to sweep over said curved inner surface to bend over the edge of the metal, said gripping-jaws and inner jaw being pivoted together in line with each other and all out of plumb with the bite of the gripping-faces of the gripping-jaws, and a foot-lever to operate said inner jaw.

3. In roofing-tongs, the combination of two main gripping-jaws formed with an opening or space between their inner surfaces, and an inner jaw adapted to move within said opening or space to bend over the edge of the metal, said gripping-jaws and inner jaw being pivoted on a common axis and all out of plumb with the bite of the gripping-faces of the gripping-jaws.

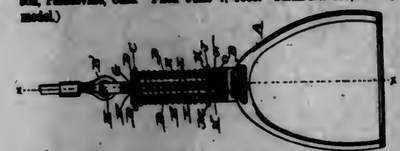
4. In roofing-tongs, the main gripping-jaws pivoted together, one of said jaws having an angular horizontal ledge or lip, in combination with an inner pivoted jaw provided with an angular cut or recess along its edge adapted to sweep over said angular ledge or lip for the purpose of bending the metal.

5. In roofing-tongs, the combination of the curved jaws A and B, having the straight gripping-surfaces *a* and *b*, one of said gripping-surfaces projecting above the other and forming the ledge or lip E, in combination with the pivoted jaw F, having the angular cut or groove *f* upon its edge, and means to operate said jaw.



411,756. DEVICE FOR BENDING METAL PIPE. HENRY M. BRENNAN, Brooklyn, N. Y. Filed July 12, 1888. Serial No. 317,371. (No model.)

Claim.—1. A tapering spiral coil of wire for bending metallic pipe.



2. A tapering spiral coil of wire for bending metallic pipe, having the surface of the wire forming the exterior of the coil somewhat flattened.

3. A tapering spiral coil for bending metallic pipe constructed of wire, having a flat or plane surface on the side forming the exterior of the coil.

4. A tapering spiral coil for bending metallic pipe constructed of wire, having a flat or plane surface on the side forming the exterior of the coil, and having the edges of such plane or flat surface rounded off.

411,757. STIRRUP. JOHN BELL, Cincinnati, assignor to H. H. Johnson, Painesville, Ohio. Filed June 7, 1888. Serial No. 313,466. (No model.)

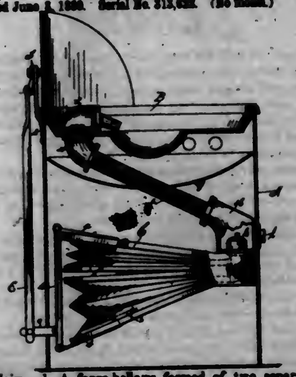
Claim.—The combination, in a stirrup, of the spring attachment comprising the top and bottom plates, fixed side rods, movable center rod, and their respective springs, arranged as described, the downwardly-projecting hooked and clinched block N, and the stirrup having a slot at its upper end conforming in shape to the concave-convex hooked and clinched end of the block, substantially as and for the purpose shown and set forth.

411,758. LETTER-PRESS. HARDY W. CAMPBELL and JOHN P. DAVIS, Racine, Wis., assignors to the Racine Malleable and Wrought Iron Company, same place. Filed Nov. 26, 1888. Serial No. 291,988. (No model.)

Claim.—In a letter-press, the combination of the base-plate A, the movable plate B, the elastic strap E, attached to said plate B, the vertical pressure-rod D, the horizontal lever C, and the handle H, provided with the cam or elbow A and pivoted to the lever C, the key *c*, and the vertical bars G G, substantially as described and set forth.

411,759. CORN-CLEANER. JOHN R. CORNWALL, Moline, Ill., assignor to the Barnard & Leas Manufacturing Company, same place. Filed May 11, 1888. Serial No. 273,543. (No model.)

Claim.—1. In a grain-separator, the combination of a fan and two air-trunks, with a shaking-shoe extending beneath one air-trunk and to an opening in the side of the other air-trunk, and provided with aprons and a screen, whereby grain delivered onto the shoe is passed through one air-trunk, again received upon the shoe, passed through the screen, and into the second air-trunk, substantially as described.



2. The combination of the vibrating shoe G, constructed substantially as described, with the vertical air-trunks E and F, and the fan communicating therewith, air-trunk E being situated above the delivery end of the shoe and adapted to receive the grain in its passage from the upper apron of the shoe to the screen thereof, and air-trunk F receiving the grain as it finally leaves the shoe, substantially as specified.

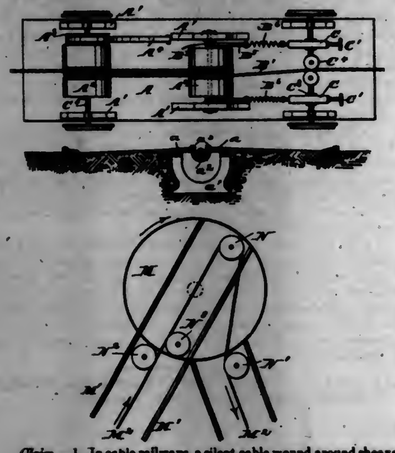
3. The combination of the fan and pair of vertical air-trunks E and F, having openings in their sides and at bottom, with a vibrating shoe extended below trunk E and discharging into the trunk F and having an apron entering trunk E through its side opening to deliver grain therethrough, and a screen extending below said trunk E, and an apron below said screen adapted to receive the grain after its passage therethrough and deliver it to the air-trunk F, all substantially as described.

4. In a grain-separator, the combination of the vertical air-trunks E and F, and fan, with the screen-shoe extended below trunk E and to an opening in trunk F, and having an apron G' delivering grain into trunk E, a screen receiving the grain after its passage through trunk E, and an apron below said screen adapted to deliver the grain into air-trunk F, said aprons having serrated edges to distribute the grain in the trunks, substantially as described.

5. In a separator, the combination, with the fan and two air-separating trunks, of a vibrating shoe G, constructed substantially as described, extended beneath one air-trunk to the other and provided with two aprons, and a sieve located between the aprons and adapted to deliver the material received on the shoe to both of the air-trunks successively, and subject the material to the action of the sieve in its passage from one air-trunk to the other, substantially as and for the purpose described.

411,760. PORTABLE FORGE. ALBERT R. DAIN, Pittsburg, Pa. Filed June 4, 1888. Serial No. 313,628. (No model.)

Claim.—1. A forge-bellows formed of two separate compartments, either of which is adapted to be expanded when the other is contracted, whereby a constant draft is had, substantially as and for the purpose herein set forth.



2. In a portable forge provided with a suitable fire-hearth, the combination of the bellows, substantially as described, and means for contracting and expanding either section alternately, whereby a constant draft is had, the valves attached to the nozzle of either section, respectively, and the air-chamber connected by a pipe or tube with the tuyere, substantially as and for the purpose set forth.

411,761. CABLE-SHEAVE. JOSEPH D. DAVIES, Cincinnati, Ohio, assignor of one-half to Henry Martin, same place. Filed Nov. 10, 1888. Serial No. 290,804. (No model.)

Claim.—In combination with the sheave proper, having outer circular flanges A and a recess *a* between them, the bottom connecting portion of said flanges having openings d^3, the segments D, having projections *d*, said projections having an opening d^3, through which a wedge *d'* is inserted for retaining the segments in place, substantially as set forth.

411,762. CABLE RAILWAY. JOSEPH D. DAVIES, Cincinnati, Ohio, assignor of one-half to Henry Martin, same place. Filed Nov. 24, 1888. Serial No. 291,807. (No model.)

Claim.—1. In cable railways, a sheet cable wound around sheaves attached to the car, the cable passing around in grooves in both of said sheaves, said sheaves being widened, as shown, to act as guides should the cable slip out of the grooves in the sheaves, one of said sheaves being attached to the same axle on which one set of wheels are attached, in combination with suitable motive power attached to the car, substantially as set forth.

2. In cable railways, a cable wound around sheaves under the car, a pulley attached to one of said sheaves, which sheave and pulley are attached to one of the axles of the car, in combination with a motor attached to the car, substantially as set forth.

3. In cable railways, a cable wound around adjustable sheaves attached to the car, one of said sheaves being mounted in the axle on which one set of wheels are attached, in combination with a motor in the car, substantially as set forth.

4. In cable railways, cable E', grooved drums A^3, motor B, belt A^4, pulley A^5, and connecting parts, substantially as set forth.

5. In cable railways, a cable wound around sheaves attached to the car, suitable motive power connected to the car, in combination with a turn-table operated automatically by the car, substantially as set forth.

6. In cable railways, a cable wound around sheaves attached to the car and suitable motive power attached to the car, in combination with a brake consisting of band D^2, blocks E, lever D^4, sleeve D', screw-threaded shank D^5, and connecting parts, substantially as set forth.

7. In cable railways, a cable wound around sheaves attached to the car, and suitable motive power attached to the car, in combination with a U-shaped conduit having flanges *a*, substantially as set forth.

8. In cable railways, a silent cable passing over sheaves under the car, and suitable motive power attached to the car, in combination with a double conduit, substantially as set forth.

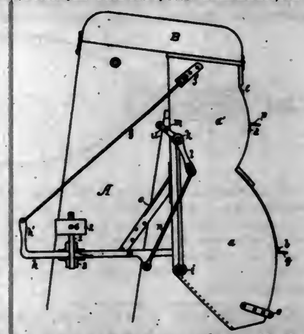
9. In cable railways, a rail having a hooked portion *a'* to guide the cable around a curve, in combination with a silent cable, substantially as set forth.

10. In cable railways, a cable wound around sheaves under the car, and suitable motive power attached to the car, in combination with a gripping-lever, as *b*, pull-rod A, and connecting operating mechanism, substantially as set forth.

11. In cable railways, a U-shaped conduit made in sections, provided with flanges, as *a*, extending over to connect to the side arms of the lower conduit, substantially as set forth.

12. In cable railways, a U-shaped conduit made in sections and perforated, having flanges, as *a*, which extend over to connect to the side arms of the lower conduit, substantially as specified.

13. In cable railways, a lower conduit, in combination with pieces, as a^4 and a^5, substantially as and for the purposes specified.



14. In cable railways, a conduit provided with lugs, as a^5, substantially as set forth.

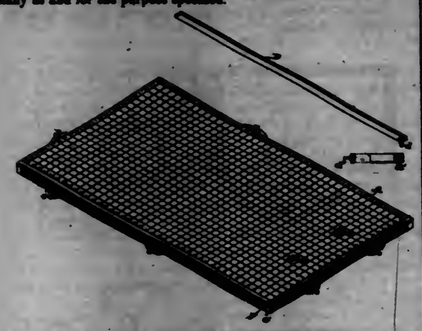
15. In cable railways, a device for gripping the cable, consisting of a lever, as *b*, pull-rod A, rod A^2, and connecting and operating mechanism, substantially as set forth.

16. In cable railways, a cable, cable car, a turn-table, and sheaves on said turn-table, and in combination therewith, as shown, said turn-table being operated by the car passing onto it, substantially as set forth.

17. In cable railways, the combination, with a cable and cable car, of a turn-table, in connection with suitable sheaves N, N', N^2, and N^3, substantially as set forth.

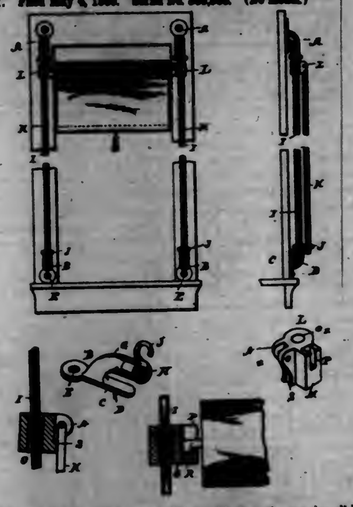
411,768. AUTOMATIC GRAIN-WEIGHER. THOMAS J. UNDERWOOD, Decatur, Ill. Filed Oct. 3, 1888. Serial No. 287,562. (No model.)

Claim.—1. In automatic grain-scales, in combination, weighing-bucket *w*, rigidly secured to the scale-beam and having door *y*, pivoted at *z*, cut-off bucket *r*, having door *s*, pivoted at *t*, rod *n*, connecting the scale-beam with the cut-off bucket, projections *p* and *q* on the cut-off bucket and weighing-bucket, respectively, and stops *c* and *d*, to open the doors by limiting the downward swing of the projections, as and for the purpose set forth.



2. In automatic grain-scales, in combination, weighing-bucket *w*, secured to the scale-beam and having door *y*, cut-off bucket *r*, having door *s* and arm *n*, lever *l m*, fulcrumed on the pivot of the cut-off bucket and secured at one end to arm *u*, and rod *n*, connecting the scale-beam with lever *l m*, as and for the purpose set forth.

3. In combination, a weighing-bucket secured to a scale-beam, and a vertical bar adjustable on the beam and carrying a vertically-adjustable weight, as and for the purpose set forth.



411,764. GLASS-CUTTING APPARATUS. CHARLES W. WIDMER, Canton, Ohio. Filed May 27, 1889. Serial No. 312,326. (No model.)

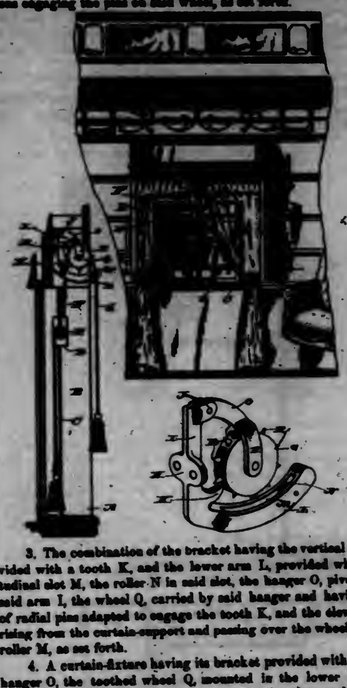
Claim.—1. The board A, composed of strips *a*, the grooves *c*, located upon the side and end of said board, the grooves *d*, crossing each other at right angles, and the straight-edge D, provided with the pin *d'*, adapted to engage the grooves *c*, substantially as and for the purpose set forth.

2. The board A, provided with the grooves *c*, and the colored grooves *d*, located in line with the grooves *c*, and the straight-edge D, provided with the pin *d'*, adapted to engage the grooves *c*, substantially as and for the purposes specified.

411,765. CURTAIN-FIXTURE. FRED. H. RADDATZ, Sherman Lake, N. Y. Filed May 4, 1889. Serial No. 309,556. (No model.)

Claim.—1. The combination of the guide-bar, the carrier sliding thereon and having the shoulder S on its front side, the said carrier supporting the curtain-roller, and the operating-lever pivoted to the front side of the carrier and bearing on the said shoulder S, as set forth.

2. The combination of the guide-bar, the carrier sliding thereon and supporting the curtain-roller and provided on its front side with the perforated lugs N and the shoulder S, the hook J near the lower end of the guide-bar, and the operating-lever having its upper end pivoted between the lugs N and bearing on the shoulder S, and having its lower end engaging the hook J, as set forth.

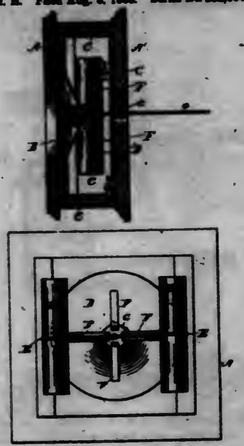


3. The socket-casting consisting of the base-plate C, having the spur D and perforation E, the socket-arm G rising from the base-plate and having the recess H in its end, and the hook J at the end of said arm, as set forth.

4. In a curtain-fixture, the combination of the guide-bar I, the carrier for the curtain-roller sliding thereon, the operating-lever K connected to the carrier, and the socket-casting to receive the lower end of the rod I, and provided with a hook J to engage with the lever K, as set forth.

411,766. CURTAIN-FIXTURE. FRED. H. RADDATZ, Sherman Lake, N. Y. Filed May 4, 1889. Serial No. 309,561. (No model.)

Claim.—1. In a curtain-fixture, the combination of the bracket H, the hanger O, pivoted thereto, and the wheel mounted in the said hanger and adapted to engage a tooth on the bracket, as set forth.

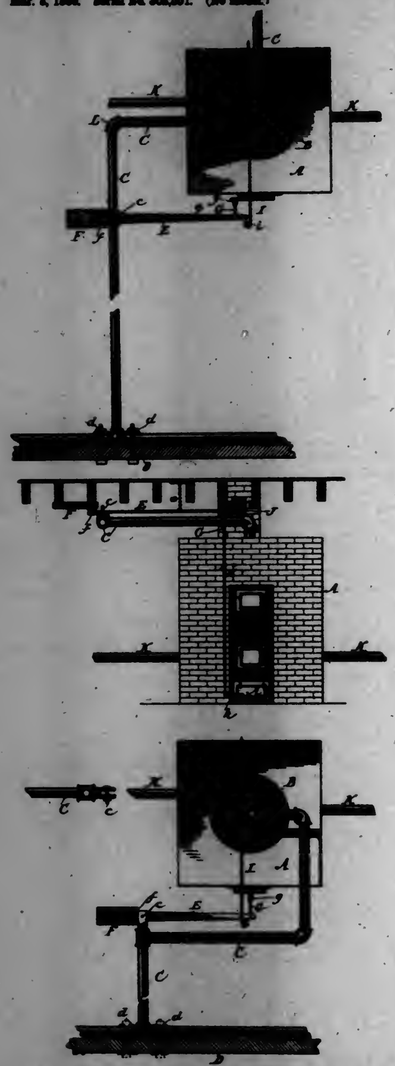


2. The combination of the curtain-support, the bracket H, having the tooth K, the hanger O, pivoted to said bracket, the wheel Q, carried by said hanger and having a series of radial pins adapted to engage the said tooth, and the elevating-band secured to the curtain-support and passing over the wheel Q, and having a series of perforations engaging the pins on said wheel, as set forth.

3. The combination of the bracket having the vertical arm I, provided with a tooth K, and the lower arm L, provided with a longitudinal slot M, the roller N in said slot, the hanger O, pivoted to the said arm I, the wheel Q, carried by said hanger and having a series of radial pins adapted to engage the tooth K, and the elevating-band rising from the curtain-support and passing over the wheel Q and the roller M, as set forth.

4. A curtain-fixture having its bracket provided with a swinging hanger O, the toothed wheel Q, mounted in the lower end of the hanger and adapted to engage a lug on the bracket, and the elevating-band secured to the curtain-support and passing over the toothed wheel, as set forth.

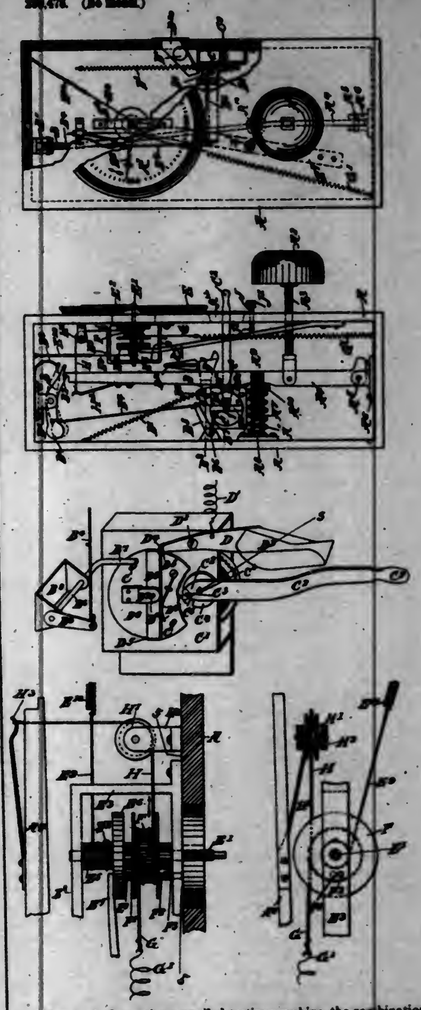
411,767. MECHANICAL TELEPHONE. WILLIAM H. EASTMAN, Concord, N. H. Filed Aug. 6, 1888. Serial No. 282,087. (No model.)



Claim.—1. In a mechanical telephone, a case or lining of glass in the rear of and inclosing the diaphragm, substantially as set forth.

2. In a mechanical telephone, the combination, with the transmission-line, of a device for deadening extraneous vibrations, consisting of a liquid-tight chamber filled with a suitable liquid, as water or

alcohol, and a vibration-conductor extending from the said chamber to the line-wire, substantially as set forth.



3. In a mechanical telephone, the combination, with the diaphragm, of a rider provided with metallic arms, as F F F F, said rider being suitably connected with the center of said diaphragm, and perforated to allow the passage of the line-wire, all substantially as set forth.

411,768. DRAFT-REGULATOR. WILLIAM R. HAXTUN, Kewanee, Ill., assignor to the Haxtun Steam Heater Company, same place. Filed Mar. 6, 1888. Serial No. 302,851. (No model.)

Claim.—The combination, with a furnace, a boiler, and a hot-water or steam circulating pipe held stationary at some point, but free to expand and contract with variations in temperature of the hot water or steam that flows through said pipe from the boiler, of a freely-swinging lever pivoted directly to said circulating-pipe at a distance from its fixed point, and a connection between said lever and a draft-door of the furnace, substantially as described.

411,769. COIN-CONTROLLED BLOW-TESTING MACHINE. JOHN F. KINSWILL, Chicago, Ill., assignor to T. J. Holmes, C. W. Reed, and Charles L. Wakefield, all of same place. Filed Feb. 11, 1889. Serial No. 299,670. (No model.)

Claim.—1. In a coin-controlled testing-machine, the combination of a testing apparatus, a lock therefor, a clock mechanism which controls such lock, and a coin-controlled release for such clock mechanism.

2. In a coin-controlled testing-machine, the combination of an apparatus with a lock therefor, a clock mechanism which when at rest holds such lock in engagement and when in operation leaves the same free, and a coin-controlled catch for such clock mechanism.

3. In a coin-controlled testing-machine, the combination of a testing apparatus, a lock therefor, with a clock mechanism having a movable part which when at rest holds the lock, and a coin-controlled catch for such movable part which normally holds the same locked.

4. In a coin-controlled testing-machine, the combination of a pivoted bar with a spring on one side and a striking-cushion on the other connected therewith, a lock which normally prevents the bar from rocking, a clock mechanism which controls such lock, and a coin-controlled catch for such clock mechanism which normally prevents said clock mechanism from moving and thus from releasing the lock.

5. In a coin-controlled testing-machine, the combination of a testing apparatus with a time-lock therefor independent of said testing apparatus when the same is released, and a coin-controlled catch for such lock which, when operated by a coin, releases said lock, and thereby releases the testing apparatus and after a predetermined period of time automatically again locks the same independent of any operation of said apparatus.

6. In a coin-controlled testing-machine, the combination of a testing apparatus with a lock therefor, a time mechanism which, when in operation, releases said lock for a considerable period, and a coin-controlled catch for such time mechanism which normally holds it out of operation and adapted to release the time mechanism when the coin is introduced.

7. In a coin-controlled testing-machine, the combination of a testing apparatus with a lock therefor, a clock mechanism controlling said lock, a notched disk rotated by the said clock mechanism, connections therefrom to the lock so as to hold the apparatus locked when the clock mechanism is not in motion, and a dog which engages a notch on each disk at one end and locks the disk and carries a scoop at the other to receive the coin and release the dog from said disk and allow the same to rotate and release said apparatus.

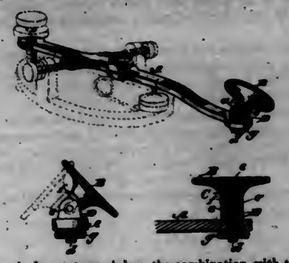
8. In a coin-controlled testing-machine, the combination of a testing apparatus with a lock therefor, a clock mechanism, a disk rotated by the said clock mechanism, and connections therefrom to the lock, so as to hold the apparatus locked when the clock mechanism is not in motion, a dog which engages a notch on each disk at one end and carries a scoop at the other to receive the coin, and a spring-bar pivoted on each disk adapted as soon as the dog is raised to slip under the end thereof and prevent the clock mechanism from again being locked until it has made a portion of its revolution.

9. In a coin-controlled testing-machine, the combination, with mechanism the movement of which is to be registered, of a dial with a hand which moves over the same, a shaft to which the hand is secured, a drum loosely mounted on such shaft, flexible connections between said drum and said mechanism, whereby the drum is rotated in one direction when such mechanism is operated, a spring to return the drum to its normal position, and two pins—one on such shaft and one on such drum—so that when the drum is rotated in one direction it carries the shaft and hand with it, but does not so carry them when rotated in the opposite direction.

10. In a strength-testing machine, the combination of mechanism the movement of which is to be registered, a dial, a shaft carrying a hand to move over the dial, a drum loosely mounted on such shaft, a flexible connection between said drum and said mechanism to rotate the drum in one direction, a spring connected with the drum to return the same to its normal position, pins on the shaft and drum to cause the shaft to rotate in one direction with the drum, a spring connected with and adapted to return the shaft and its hand to zero, and stops or pins to prevent the shaft rotating in the opposite direction past zero, substantially as described.

11. In a coin-controlled testing-machine, the combination, with mechanism the movement of which is to be registered, of a dial with a hand which moves over the same, a frame, a shaft to which the hand is secured, a drum loosely mounted on such shaft, flexible connections between such drum and mechanism to rotate the drum in one direction, and four pins—two on the drum, one rigid with the shaft, and one rigid with the frame—those on the drum adapted to engage the other two in opposite directions, so that the drum cannot move beyond a certain point in one direction and when traveling in the other direction may carry the shaft with it.

12. In a coin-controlled strength-testing machine, the combination of a spring rocking-bar and a striking-cushion attached thereto, a rotary shaft having an indicating-hand attached thereto, a rotary drum loosely mounted on said shaft, means to lock the shaft to the drum when rotating in one direction, springs to return the shaft and drum to their normal positions, and a cord connecting the free end of said rocking-bar with said drum to rotate the same and the hand, substantially as described.



13. The combination, with a registering mechanism, of a spring rocking-bar connected with and adapted to operate said mechanism, a lock for the bar to hold the same rigid, and a coin-controlled lever or catch adapted, when operated by a coin, to release said lock and hence the bar, as and for the purpose set forth.

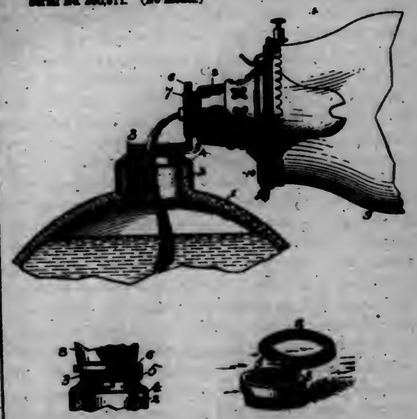
14. The combination of a rocking-bar, a pivoted lock or catch for the bar, a rock-shaft connected with said lock to release said bar, a clock mechanism to operate said shaft, and a coin-controlled catch for said clock-work which, when operated by a coin, releases the clock and thereby unlocks the bar for a predetermined period of time, as and for the purpose set forth.

15. The combination, with mechanism the movement of which is to be registered, of a time-lock for said mechanism which, when operated, releases the mechanism and after a predetermined time automatically relocks the same independent of any movement of the mechanism, said time-lock comprising a lock and clock-work controlling the same, and a coin-controlled release for the clock-work, substantially as described.

16. The combination, with a case and mechanism the movement of which is to be registered, of a time-lock for said mechanism comprising a lock and clock-work controlling the same, means connected with the winding-shaft of said clock-work and extending to the exterior of the case, whereby the clock-work can be wound up, and a coin-controlled release and lock for the clock-work, substantially as described.

411,770. TELEGRAPH-KEY. HARRY S. THEIS, HANNAS G. LANE, and VIRTUS OSBORN, Washington, D. C. Filed Dec. 15, 1888. Renewed Mar. 11, 1889. Serial No. 302,963. (No model.)

Claim.—1. In a telegraph-key, the combination, with the vibrating key-lever, of a button mounted thereon and adjustable to either side of said lever, substantially as and for the purpose specified.



2. In a telegraphic key, the combination, with the key-lever, of a button connected thereto by a universal joint and mechanism whereby the button may be held in any position to which it may be adjusted, substantially as specified.

3. The combination, with the vibratory key-lever of a telegraph-instrument, of a button adjustable upon said key-lever to bring the top or top surface of said button into planes of different inclinations upon all sides of a vertical line passing through the pivoted axis of said button, substantially as described, and for the purpose specified.

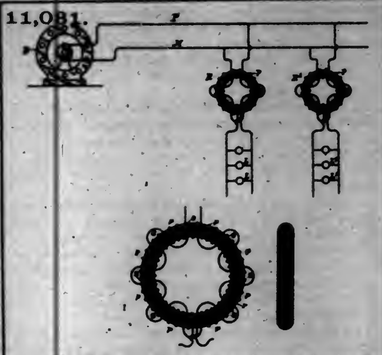
4. In combination, the button B, screwed upon a threaded shank C, pivoted to the lug D, carrying a jam-nut *g*, substantially as shown and described.

5. In combination, the button B, screwed upon the screw-threaded shank C, pivoted to the lug D, carrying a jam-nut *g* and a washer *f*, interposed between the top of the bifurcated lug D and the bottom of the button B, all constructed and arranged substantially as shown and described, and for the purpose specified.

411,771. LAMP. CLIFFORD P. THAYER, Holbrook, assignor of one-half to Charles Sumner Bates, Braintree, Mass. Filed Nov. 14, 1888. Serial No. 290,811. (No model.)

Claim.—1. The herein-described device, consisting, essentially, of two internally-threaded rings hinged together, to swing toward and from each other, substantially as described.

2. As a new article of manufacture, the herein-described device, comprising two hinged internally-threaded rings, one of which is also externally threaded, substantially as described.



3. In a lamp, the combination, with the oil-reservoir and the burner, of two hinged internally-threaded rings, one of which is secured to the oil-reservoir, substantially as described.

REISSUES.

11,031. SYSTEM OF ELECTRICAL DISTRIBUTION. RANKIN KENNEDY, Glasgow, County of Lanark, Scotland, assignor, by mesne assignments, to the Westinghouse Electric Company, Pittsburg, Pa. Filed Aug. 23, 1889. Serial No. 321,251. Original No. 407,204, dated July 16, 1889.

Claim.—The method of distributing and regulating alternating electric currents by secondary generators, which consists in producing in two or more derived circuits constituting the primaries of two or more secondary generators a counter electro-motive force which, when any secondary is open, is practically equal to the applied electro-motive force in its primary and in controlling said electro-motive force by the current flowing in the corresponding secondary when the secondary is closed in such manner that the current in the primary shall

11,031.

vary with and be approximately inversely proportional to the resistance in the secondary, substantially as described.

PHOTO LITH NORRIS PETERS WASH'N D.C.

DECISIONS
OF THE
COMMISSIONER OF PATENTS
AND OF
UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court—Southern District of New York.

KREMENTZ *v.* COTTLE COMPANY.

Decided June 21, 1889.

KREMENTZ—COLLAR-BUTTON.

The patent granted to complainant May 6, 1884, for a collar or sleeve button having a hollow head and stem, the said head, stem, and the base-plate or back of the said button being shaped and made of a single continuous piece of sheet metal, is void for want of novelty. The Stokes patent, No. 171,882, January 4, 1876, covers a button composed of a single piece of sheet metal, the only difference being that the head is flat and solid instead of round and hollow, like complainant's; and the Keats patent, No. 177,353, May 9, 1876, also covers a button made of a single piece of sheet metal having a hollow head and hollow stem of the same form as complainant's.

ON FINAL hearing upon bill for infringement of patent.

Mr. Louis C. Roegener for the complainant.
Mr. Edwin H. Brown for the defendant.

WALLACE, *J.*:

The patent in suit granted to complainant May 6, 1884, is, in the words of the claim, for—

a collar or sleeve button having a hollow head and stem, the said head, stem, and the base-plate or back of the said button being shaped and made of a single continuous piece of sheet metal, substantially as shown and described.

The specification and drawings describe and illustrate a button in the form of a stud. It is made of a single piece of metal without soldering or joints. By means of any suitable dies a metal plate is pressed into the form of a cap, with a flange or rim at the bottom, and then the sides of the cap are pressed together about the middle in any suitable manner to form the head and stem.

The prior state of the art may be sufficiently understood by referring to only two of the several earlier patents in the record.

The patent to Stokes, No. 171,882, granted January 4, 1876, describes a stud composed of one piece of sheet metal, in which the head and stem are made by striking them up or raising them out of the metal base-plate by means of a punch and die. The stud is of substantially the same form as the stud of the complainant's patent, except that the head is flat instead of round, the stem is hollow, and the head is solid.

The patent to Keats, No. 177,353, granted May 9, 1876, describes a button or stud made of a single piece of sheet metal having a hollow head and hollow stem, and is of the same form as the stud of the complainant's patent. It has an extra shank or base-plate. In making it the sheet-metal blank is formed in two sections having the desired configuration, one of which is doubled over upon the other, and the edges are brought together by lateral pressure.

It thus appears by the two prior patents referred to that the complainant was not the first to make a hollow stud, or a hollow stud from a single piece of metal, or a stud from a single continuous piece of metal, or a partly hollow stud from a single continuous piece of metal. So far as appears he was the first to make a stud from a single continuous piece of metal in which the head was hollow and round in shape. The stud of the Stokes patent would be his if the head were not flat and preferably solid, instead of being round and hollow. The stud of the Keats patent would be his if it were not folded over and joined by lateral pressure at the sides, so as not to be made of a continuous piece of metal. For the particular use for which the Stokes stud was designed a flat and solid head was preferable, and for the particular use for which the Keats stud was designed a joint or seam at the sides was not objectionable. For the use for which the complainant's stud was designed a round head was preferable, and a seam at the sides was objectionable. He desired to improve upon his predecessors by making a stud without a seam, and thus obviate the necessity of soldering, and which should be hollow throughout and thereby save material; and he desired to make a stud differing somewhat in details of the configuration of the parts from that of Stokes or Keats. The idea and the method of making a seamless stud out of a single continuous piece of metal was suggested and fully shown by the patent of Stokes, and the idea and method of saving material by having the entire stud hollow was suggested and fully shown by the patent to Keats. It is not open to reasonable doubt that any competent mechanic versed in the manufacture of hollow sheet-metal articles having before him the patents of Stokes and Keats could have made these improvements and modifications without exercising invention and by applying the ordinary skill of the calling. Indeed, the stud of the Stokes patent alone is a substantial anticipation of the complainant's patent. The different manipulation of the blank necessary to introduce the desired modifications of form, and the hollow head, which distinguish the studs, was within the obvious knowledge of the skilled mechanic.

It must be held that the patent is invalid for want of novelty. The bill is dismissed, with costs.

U. S. Circuit Court—District of Massachusetts.

RAYMOND *et al. v.* BOSTON WOVEN HOSE COMPANY.

Decided July 12, 1889.

INFRINGEMENT—INJUNCTION.

A preliminary injunction against the infringement of a patent will be denied where plaintiff does not show a prior adjudication sustaining the validity of the patent, or public acquiescence on which a presumption of validity may be based and where it does not clearly appear that there is an infringement.

BILL TO restrain infringement of patent.

Messrs. Clarke & Raymond for the complainants.
Mr. David Hall Rice for the defendant.

COLT, *J.*:

The complainants are the owners of two patents, numbered, respectively, 197,716 and 197,717, dated December 4, 1877, granted to J. A. Caldwell, the first being for an improved strap for securing hose to the coupling and the second for an implement for fastening such hose-straps. The defendant is charged with infringement of these patents. The present hearing is upon a motion for a preliminary injunction. The first ground of defense is that the plaintiffs have shown neither prior adjudication sustaining the validity of the patents nor public acquiescence upon which a presumption of validity may be based, and that therefore whatever the decision of the court may be upon final hearing on the merits the present motion, under a well-settled rule of law, must be denied. I think this point is well taken. It is admitted that there has been no prior adjudication upholding the validity of these patents. As to public acquiescence, the evidence goes to prove that this strap and implement have never been put upon the market. The reason assigned by the complainants for not making and selling the Caldwell strap—namely, that it is more costly than the Adlan and Earle straps—does not affect the question of public acquiescence. In the absence of the manufacture and sale of the patented article it can hardly be said that there has been public acquiescence. If nobody had use for the article during the time of the alleged acquiescence, or its merits were priced so low that nobody cared to adopt it, no lapse of time has any tendency to raise a presumption that the patent is valid. (Walk. Pat., section 668.) But further than this, I have some doubt on the question of infringement. As to the tool patent, I have serious doubt whether the defendant infringes. The claim of the patent specifically recites that the grooves or notches in the jaws of the pivoted levers shall be located out of line with each other, and this feature seems to be necessary for the practical working of the tool when applied to fastening a Caldwell hose-strap. In the Hudson, or alleged infringing tool, we find in place of notches out of line two holes punched in the jaws in alignment with each other. In the case of the strap patent it must be admitted that the question of infringement is closer. The specification states that the band is made of self-anncaled wire, of such length that the enlarged ends will extend beyond and overlap each other, so as to admit of their being twisted by turning the implement, whereby they are locked or hooked together, and the portion of the hose under the band is thus forced into the corrugations of the coupling and securely held. A wire band provided with enlarged ends is one of the main features of the claim of the patent. The defendant's hose-band does not have the enlargement shown in the Caldwell band, though I am aware that the language of the specification is very broad on this point. The defendant uses hooks at the end of the band instead of the Caldwell enlargements. I do not think the defendant's band, in spite of the opposite contention, can be practically applied with the Caldwell tool. The manner of operation and the purpose of the defendant's hooks cannot be said to be the same as the Caldwell enlargements. Construing these patents in the light of the prior state of the art, I am not free from doubt on the question of infringement.

Upon all the facts of this case as presented in the papers before me I am satisfied that the motion for a preliminary injunction should be denied.

REPORT OF THE COMMISSIONER OF PATENTS

FOR THE FISCAL YEAR 1888-1889.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., September 16, 1889.

SIR: I have the honor to submit the following report of the business of this Office for the fiscal year ended June 30, 1889:

Received:	
Applications for patents	36,740
Applications for design patents	908
Applications for reissue patents	101
Applications for registration of trade-marks	1,981
Applications for registration of labels	772
Caveats	2,345
Total	42,047
Number of patents granted, including reissues and designs	21,518
Number of trade-marks registered	1,111
Number of labels registered	312
Total	22,941
Number of patents withheld for non-payment of final fees	2,858
Number of patents expired	11,980

Receipts and Expenditures.

Receipts from all sources	$1,186,557 22
Expenditures (including printing and binding, stationery, and contingent expenses)	999,697 24
Surplus	$186,859 98

Balance in the Treasury of the United States on account of the Patent fund.

June 30, 1888	$3,337,666 65
June 30, 1889	186,859 98
Total	$3,524,526 63

Comparative Statement.

	Receipts.	Expenditures.
June 30, 1885	$1,074,974 35	$970,277 58
June 30, 1886	1,206,167 80	991,839 41
June 30, 1887	1,150,046 05	981,644 09
June 30, 1888	1,122,994 83	953,720 14
June 30, 1889	1,186,557 22	999,697 24

Comparative Statement showing the increase in the number of applications for Patents, including Reissues, Designs, Trade-Marks, and Labels.

June 30, 1885	35,688
June 30, 1886	38,678
June 30, 1887	38,408
June 30, 1888	37,769
June 30, 1889	39,702

Number of applications awaiting action on the part of the Office.

July 1, 1885	5,786
July 1, 1886	6,772
July 1, 1887	7,001
July 1, 1888	7,227
July 1, 1889	7,073

From the foregoing it will be seen that the total number of applications received, including designs, reissues, &c., was 42,047; that the number of patents granted was 22,941; that the total receipts were $1,186,557.22; that the total expenditures were $999,697.24, leaving a surplus of $186,859.98 to be turned into the Treasury of the United States to the credit of the patent fund, and making a total balance in the Treasury on account of the patent fund of $3,524,526.63.

CONDITION OF BUSINESS.

At the close of the fiscal year 1888-1889 the business of the Patent Office was in a satisfactory condition as compared with former years. The examinations of applications for patents carried on in twenty-four of the thirty examining divisions had been brought up to within two months of that date, and of the remaining six divisions one-half were less than three months in arrears. I find in the Commissioner's report for the fiscal year ending in 1887 the statement that the condition of the work in the bureau, then existing, would compare favorably with any previous year, coupled with the statement that only one division was in arrears over six months and only seven exceeding three months. It will be observed that the present condition is still more satisfactory. It is believed, however, that the arrears in work in all the divisions can be practically done away with at an early date through the cordial co-operation of the force with the efforts of the Commissioner.

THE NECESSITY OF ADDITIONAL ROOM.

That the work of the Office may be promptly dispatched it is indispensable that more room and better facilities should be provided. I can add nothing upon this subject to what has been urgently said by my predecessors, except to allude to representative instances showing the crowded condition of the rooms in which the work is sought to be accomplished. The room occupied by Division XXVIII has nineteen by twenty-three feet of floor-space. In it are nine desks, occupied by nine men and women. In addition to the desks are book and file cases arranged against the wall and extending upon all sides of the room. In the room occupied by Division V the floor-space is thirty-five by twenty feet in extent. In it are ten desks occupied by ten persons. Book and file cases extend around the room on every side. These instances differ only in degree from nearly all the rooms devoted to the business of this Bureau. I share in the belief entertained by Commissioner Hall that the saving which would be effected by supplying the Patent Office with sufficient room and adequate conveniences, accompanied by the suitable rearrangement of the location of the divisions with reference to each other, would be sufficient to pay the rental for a building adequate to the needs of an entire bureau.

LEGISLATION.

It is, I believe, generally conceded that legislation is needed amendatory of the Revised Statutes relating to patents. Some of the provisions which should be altered are section 4885, relating to the date of patents; section 4887, relating to the duration of patents for inventions previously patented in a foreign country, and section 4936, relating to reimbursement of moneys paid by mistake into the Treasury. Other sections could be amended to the advantage of the patent system. More specific suggestions will be made upon this subject in my report to Congress. The opinion is

indeed gaining ground that a revision of the patent act would be of advantage not only to the inventor but to the public generally.

DECISIONS OF FEDERAL COURTS.

An opinion has found expression that the policy of the Patent Office in adjudicating upon questions arising in the granting of patents should conform more nearly to the decisions of the Federal courts. There can be no doubt of the correctness of this view, and accordingly it would be wise for Congress to require the clerks of the Federal courts to furnish certified copies of all decisions and opinions in patent causes for publication in the OFFICIAL GAZETTE.

COMPENSATION OF PRINCIPAL EXAMINERS.

I cannot close this report without directing attention to the fact that some of the employés of this Bureau are grossly underpaid. The most conspicuous instance of this character is the compensation of Principal Examiners. The Revised Statutes fix the salaries of these officers at $2,500 per annum. This sum was established by Congress in the year 1848. (9 Statutes at Large, 231.) It has never been increased. On the contrary the amount appropriated for a number of years has been $2,400. These examiners are experts of the highest order. Their duties call for superior legal ability. As heads of divisions they must have executive capacity. They frequently resign their positions for the simple reason that they can do better for themselves in a private capacity. Two have resigned for that reason since the present Commissioner assumed office in April last. I believe that a public sentiment has at last developed that will sustain Congress in providing that the Principal Examiners of the Patent Office shall be fairly and fully paid.

Very respectfully, your obedient servant,

C. E. MITCHELL,
Commissioner.

THE SECRETARY OF THE INTERIOR.

DIGEST OF DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS

IN THE MATTER OF

PATENTS, TRADE-MARKS, &c.

OFFICIAL GAZETTE—July-September, 1889.

DIGEST OF DECISIONS.

[Decisions of United States courts designated by an asterisk (*).]

ABANDONED APPLICATIONS.

1. EFFECT OF ALLUSION IN A PATENT TO ABANDONED CLAIMS IN A FORMER APPLICATION ON QUESTION OF DILIGENCE.

When an applicant, who is also patentee of an invention other than that involved in controversy, alludes in his patent to abandoned claims in a former application, the only effect that can be given to such reference is as evidence of continued interest in the subject-matter of the earlier application and of diligence in seeking to perfect and patent the invention; but such an allusion can have no effect whatever in that direction when the former application had been for nearly two years unprosecuted, and all the claims therein which had any relationship to his pending application had been deliberately stricken out and positively abandoned at the time the patent was issued.

[Beach *v.* Fowler, 821.

2. SAME—ABANDONED APPLICATION NOT A BAR TO SUBSEQUENTLY GRANTED PATENT.

An abandoned application cannot of itself constitute a bar to a subsequently granted patent. [Id.

3. SAME—PROOF OF DATE OF CONCEPTION BY ABANDONED APPLICATION.

If the thing described in the abandoned application is the same invention that is subsequently patented, it certainly does establish conception of the invention as of its own date, and if proof *dehors* the patent establishes reduction to practice or introduction into public use, and the time of the reduction to practice or of public use is in dispute, then the application shows that reduction to practice *might* have taken place at any time subsequent to its date; but when, as in the present case, there is no proof even of experiment, it can have no other effect than to establish the date of conception of the invention which it discloses. [Id.

4. COPIES OF ABANDONED OR REJECTED APPLICATIONS.

Whenever a reasonable suggestion of its necessity for the purposes of evidence is made by the person requesting it, the Commissioner of Patents cannot lawfully refuse to furnish a certified copy of an abandoned or rejected application for a patent. The right to be furnished such a copy is given to the public by statute, and the refusal thereof entitles the applicant to the writ of *mandamus* against the Commissioner to compel a compliance with such request.

[*United States *ex rel.* Pollok *v.* Hall, Commissioner of Patents, 1263.

5. SAME—MANDAMUS TO OBTAIN.

An attorney at law who has requested such a copy in behalf of his client and been refused has such an interest in the subject-matter as entitles him to commence proceedings in his own name as relator for the writ of *mandamus*. [*Id.

ABANDONED CLAIMS.

(See Abandoned Applications, 1; Priority of Invention.)

ACCESS TO ABANDONED OR REJECTED FILES.

(See Abandoned Applications, 4, 5.)

AMENDED BILL.

(See Suits for Infringement.)

AMENDMENTS.

(See Appeal to Examiners-in-Chief, 1; Motion to Dissolve Interference, 4.)

AMENDMENTS TOUCHING THE MERITS UNDER RULE 68.

When an amendment touching the merits is presented nearly two years after the case is in condition for appeal to the Examiners-in-Chief, and no showing or attempt at any showing whatever is made why the amendment was not presented earlier, a petition that the case be reopened and that applicant be heard upon the amendment must be denied.

[*Ex parte* Cordrey, 397.

ANALOGOUS DEVICES.

(See Infringement, 1, 2, 4.)

ANTICIPATION.

(See Invention, 2, 3; Particular Patents, 7, 9, 17.)

APPEAL.

(See Interference, 3, 4, 5, 6, 7.)

APPEAL TO EXAMINERS-IN-CHIEF.

(See Amendments.)

OBJECTIONS GOING TO THE MERITS.

When applicant claims the combination of a "stitch-forming and cloth-feeding mechanism" in a sewing-machine and "an automatic expansible or yielding hemmer and feller," and the examiner objects to the claim for the reason that the "means for securing an automatic action of the hemmer and feller" and "the means for securing an expansible or yielding action thereof" are not stated, and the applicant insists that his invention resides in a combination of which the peculiar hemmer and feller is an element, irrespective of the mere means by which its automatic action or its expansible or yielding action is secured, *Held* that the objection of the examiner presents a question of fact which relates to the merits, upon which applicant has a right of appeal to the Examiners-in-Chief.

[*Ex parte* Laskey, 539.

ASSIGNMENTS.

(See Use of Patented Articles, 1, 2.)

1. CONDITION IN ASSIGNMENT.

A provision in an assignment of a patent, that the net profits arising from sales, royalties, settlements, or other sources are to be divided between the parties to the assignment, so as to give the patentee one-fourth thereof, does not in any respect modify or limit the absolute transfer of title.

[*Rude *et al.* *v.* Westcott *et al.*, 220.

2. SAME.

Nor does a clause appointing the assignees attorneys of the patentee, with authority to use his name whenever they deem proper in the management of the business connected with the ownership of the patent, restrict in any way the interest or power of the assignees. Such a clause is simply unnecessary.

[*Id.

ATTORNEYS.

(See Abandoned Applications, 5; Assignments, 2.)

BAR TO PATENT.

(See Abandoned Applications, 2.)

CHANGE OF STRUCTURE.

(See Infringement, 1.)

CLAIMS.

(See Appeal to Examiners-in-Chief.)

PROVINCE OF CLAIMS.
It is the province of claims to relegate to the specification the enumeration of such details of construction as shall be found upon examination to be immaterial to the true scope of the actual invention. The object of enumerating these parts is to enable persons skilled in the art to practice the invention in the form set out in the patent, but not to so limit the claim of the inventor as to make it the easy prey of the infringer.
[*Ex parte* Laskey, 539.

COMBINATIONS.

(See Appeal to Examiners-in-Chief; Joinder of Invention; Particular Patents, 4.)

COMBINATIONS—PATENTABILITY.
The rearrangement of an old combination, when each element operates practically as before, is not patentable unless a new or greatly-improved result is obtained.
[*Consolidated Roller Mill Company *v.* Coombs, 255.

COMMISSIONER OF PATENTS.

(See Abandoned Applications, 3, 4; Interference, 3, 4, 5, 6, 7.)

CONCEPTION OF INVENTION.

(See Abandoned Applications, 3.)

CONSTRUCTION OF CLAIMS.

CONSTRUCTION OF CLAIMS.
Claims of patents should receive such interpretation as will enlarge or restrict them, so as to cover the actual invention when not absolutely inconsistent with the language used by the patentee. (*Winans* v. *Denmead*, 15 How., 330; *Van Marter* v. *Miller*, 15 Blatchf., 562.) If, upon the one hand, the state of the art shows the invention to have been a narrow one, a strict interpretation will be given the claims. (*Manufacturing Co.* v. *Ladd*, 102 U. S., 408.) And it is of no practical consequence whether such restrictions are imposed by the Patent Office or not. (*Toepfer* v. *Goetz*, 41 O. G., 943.) If, upon the other hand, the patentee has taken a decided step in advance of the state of the art at the time his application was filed, the courts will, if possible, construe the language of his claim so as to give him the full benefit of his improvement. (*Turrill* v. *R. R. Co.*, 1 Wall., 491; *Rubber Co.* v. *Goodyear*, 9 Wall., 788.)
[*Consolidated Roller Mill Company *v.* Coombs, 255.

CONSTRUCTION OF RULES.

(See Interference, 3, 4, 5; Motion to Dissolve Interference.)

CONSTRUCTION OF SPECIFICATIONS AND PATENTS.

(See Invention; Particular Patents, 2; Reissues.)

CONSTRUCTION OF STATUTES.

(See Interference, 5.)

CONTEMPT OF COURT.

(See Motion for Attachment for Contempt.)

COPIES OF ABANDONED OR REJECTED FILES.

(See Abandoned Applications, 3, 4.)

DAMAGES AND PROFITS.

(See Master's Report.)

1. MEASURE OF DAMAGES—ROYALTIES.
In order that a royalty may be accepted as a measure of damages against an infringer who is a stranger to the license establishing it, it must be paid or secured before the infringement complained of; it must be paid by such a number of persons as to indicate a general acquiescence in its reasonableness by those who have occasion to use the invention, and it must be uniform at the places where the licenses are issued.
[*Rude *et al. v.* Westcott *et al.*, 399.

2. SAME—PROOF OF DAMAGES.
Where complainants have failed to establish a royalty as measure of damages, and no evidence of the value of the invention to defendants is adduced, except the conjectural estimates of witnesses who had no practical knowledge of the subject, a decree for anything more than nominal damages cannot be sustained.
[*Id.

DELAY.

(See Abandoned Applications, 1; Amendments; Priority of Invention; Reissues, 3.)

DILIGENCE.

(See Abandoned Applications, 1.)

DIVISION OF APPLICATION.

(See Joinder of Invention; Separate Patents.)

1. PATENTS UPON DIVIDED APPLICATIONS—VOID PROCESS.
Under Rule 41, Rules of Practice of the Patent Office, as interpreted by *ex parte Blythe* (30 O. G., 1321) and *ex parte Herr*, (41 O. G., 463,) two patents in which the description was substantially the same, No. 348,072 for a composition for transfer surfaces for producing copies of type-writing, and No. 348,073, for a process of reproducing surfaces for type-writing and manifolding, were obtained with a single claim on each, instead of one patent with two different claims, each embodying one of the above inventions. Suit for infringement was instituted upon Patent No. 348,073 alone. *Held* that the claim of this patent covering the mere taking of a coloring substance already known and applying it to paper did not involve invention, and in view of the state of the art the patent is void.
[*Underwood *et al. v.* Gerber *et al.*, 116.

2. DIVISION—PROCESS AND APPARATUS.
Division of an application should not be demanded unless there is in the given case such a total want of interdependence between the two matters claimed as would render them absolutely independent and distinct inventions.
[*Ex parte* McMahan, 255.

3. SAME.
When the apparatus cannot operate for any other purpose than to carry out the process, and the process can be carried out only by a machine operated substantially upon the principle of that shown by the applicant, division should not be required.
[Id.

4. SAME.
In such case there is no reason for requiring a division upon the ground that the examination of the Office would be facilitated, because the field of search is precisely the same whether the application is divided or not.
[Id.

DRAWINGS.

ALTERATIONS OF DRAWINGS.
When a figure is added to an original drawing on file in the Office, without direction or permission of the Office, it must be erased or canceled, even though it has been added in good faith.
[*Ex parte* Cordrey, 397.

(See Infringement, 3; Interference, 1, 2; Testimony before Examiner.)

EVIDENCE OF INVENTION.

(See Invention, 1.)

EXAMINATION OF APPLICATIONS.

(See Amendments; Appeal to Examiners-in-Chief; Joinder of Invention.)

EXAMINERS.

(See Interference, 3, 4, 5.)

EXAMINERS-IN-CHIEF.

(See Appeal to Examiners-in-Chief.)

INFRINGEMENT.

(See Infringement, 5, 8, 11; Injunction, 2; Particular Patents, 2, 21, 22; Trade-Marks, 4.)

1. CHANGE OF FORM BUT PRODUCING SAME RESULT.
The combination covered by the third claim of plaintiffs' patent, which includes an inclined and retreating anvil to sustain the wire of the staple while being bent and to support the staple while being driven, is infringed by defendant's device having a two-part anvil, which, though different in form, accomplishes the same result in the same way.
[*Thompson *et al. v.* American Bank Note Company, 540.

2. SAME.
The only difference between the two gripping devices is that the pulleys in the defendant's device are connected with the movable jaw, while in the device of the patent they are connected with the fixed jaw; and in the patented devices the movement of the lower jaw to release the cable is a vertical movement both as respects the fixed jaw and the pulleys, while in the defendant's apparatus the movement of the lower jaw is a vertical movement as respects the fixed jaw, but not as respects the pulleys. These are merely formal differences. They do not involve any inventive thought and are immaterial as respects the function and mode of operation of the parts of the combination.
[*Root *v.* Third Avenue Railroad Company, 674.

3. INFRINGEMENT CONDUCTED SECRETLY.
In a suit for an alleged infringement conducted secretly in a manufactory reliable evidence tending to show such infringement must be produced. The plaintiff cannot depend upon the chance of obtaining evidence to support the charge from the defendant and his workmen or from an inspection of his machinery.
[*Dobson *et al. v.* Graham, 976.

4. INFRINGEMENT—OMISSION OF PART OF A COMBINATION.
Defendant's lock was substantially identical with the lock of the defendant in *Yale Lock Co.* v. *Berkshire Nat. Bank*, except that in the latter there was an additional dog controlled by the time mechanism, which dog added nothing to the efficiency or value of the lock. The defense of that case was assumed by a lock company, or its president, who afterward became president of defendant, and all the questions presented here were presented in that case. On the authority of that case *Held* that defendant's lock was an infringement.
[*Yale & Towne Manufacturing Company *et al.* v. Consolidated Time Lock Company, 1399.

INJUNCTION.

(See Motion for Attachment for Contempt.)

1. PRELIMINARY INJUNCTION—STAY OF.
It is well settled that while a patent may be adjudged valid and the defendant an infringer the award of a preliminary injunction is purely a matter of discretion, and courts are in the habit of withholding it upon such terms as to the giving of a bond and the like as may seem just and equitable, having regard to the comparative injury that will result to the parties by granting or withholding it.
[*Consolidated Roller Mill Company *v.* Coombs, 973.

2. INJUNCTION AFTER FINAL DECREE—SAME.
The power of the court to stay an injunction, even after final decree, not denied.
[*Id.

3. INFRINGEMENT—INJUNCTION.
A preliminary injunction against the infringement of a patent will be denied where plaintiff does not show a prior adjudication sustaining the validity of the patent, or public acquiescence on which a presumption of validity may be based and where it does not clearly appear that there is an infringement.
[*Raymond *et al. v.* Boston Woven Hose Company, 1776.

INTERFERENCE.

(See Motion to Dissolve Interference; Priority of Invention.)

1. MOTION TO DISSOLVE INTERFERENCE UPON THE GROUND OF ESTOPPEL BY OATH OF APPLICANT TO A PRELIMINARY STATEMENT AND BY THE TESTIMONY OF HIS WITNESSES IN A PREVIOUS INTERFERENCE WHEREIN HE WAS ONE OF TWO JOINT APPLICANTS.
An applicant in a pending interference who claims to have been the sole inventor is not estopped by reason of his oath in a preliminary statement in a previous interference, wherein he was one of two joint applicants, nor by the testimony of his witnesses in that interference, from correcting an error, if an error can be shown to exist, as to the date when his invention went into public use, when the former statement of applicant and testimony of his witnesses were made with reference to an interference proceeding in which the question of two years' prior public use was not directly in issue.
[Mead *v.* Brown, 397.

2. SAME.
In such a case there is no irregularity in declaring the pending interference, and a motion to dissolve such interference upon the ground that the party claimed to be estopped has no legal standing in the Office will be denied.
[Id.

3. MOTION TO DISMISS AN APPEAL FROM DECISION OF PRIMARY EXAMINER GRANTING OR DENYING A MOTION TO DISSOLVE AN INTERFERENCE ON THE GROUND THAT NO INTERFERENCE IN FACT EXISTS UNDER RULE 122.
From a decision of the Primary Examiner granting or denying a motion to dissolve an interference on the ground that no interference in fact exists, an appeal lies to the Commissioner under the first paragraph of Rule 124 without any reference whatever to the reasons which the examiner may give for deciding the motion either affirmatively or negatively.
[Von Weisbach *v.* Lungren, 537.

4. SAME.
A motion to dismiss such appeal on the ground that the decision of the Primary Examiner is affirmative of appellant's right to a patent, that the law makes no provision for appeal from such favorable decision, and that the Commissioner of Patents is without jurisdiction of said appeal, must be denied.
[Id.

5. JURISDICTION OF THE COMMISSIONER.
The ultimate authority under the statute upon the question whether an interference exists in fact is "the opinion of the Commissioner," (Rev. Stats., sec. 4904,) and it is more than doubtful whether a construction of Rule 124 which would deprive the Commissioner of jurisdiction could possibly be a valid one.
[Id.

6. MOTION TO DISSOLVE—APPEAL.
No appeal lies to the Commissioner from a decision upon a motion to dissolve except upon the ground that there is no interference in fact, or that there has been such irregularity in the declaration as to preclude a proper determination of the question of priority.
[Manny *v.* Easley *v.* Greenwood, Jr., 536.

7. SAME—JURISDICTION.
Where it appears upon the face of the papers that the real ground of a motion to dissolve relates to the merits, the Commissioner will not take jurisdiction either by appeal or petition.
[Id.

8. FAILURE TO DECLARE INTERFERENCE.
The fact that in such case the Office failed to declare an interference prior to the issue of the patent does not establish the fact that there is no conflict between the application and the patent.
[Bechman *v.* Johnson, 673.

9. SAME—DECLARING ISSUE.
When it appears that one party to an interference cannot be allowed a method claim while the other party bars the way, the issue covering the method practiced is properly declared, in spite of minor differences in the conflicting claims.
[Beach *v.* Fowler, 921.

INTERFERENCE BETWEEN A PATENT AND A PENDING APPLICATION.

(See Interference, 8; Motion to Dissolve Interference, 1, 2, 3.)

INVENTION.

(See Division of Application, 1; Particular Patents, 10, 12, 16.)

1. Change of Method—Process.
A change in the method of making an article of manufacture producing a different and beneficial result, although the difference consists only in improving or cheapening the article, and the change and its advantages not having been seen or made by others interested in seeing and making it, is sufficient evidence of invention to sustain a process patent.
[*Zinsser *et al. v.* Kremer, 114.

2. Change of Location of Parts.
The defendant's entire machine is simply a rearrangement of the Gray combination for the obvious purpose of an attempt to avoid his patent. The result attained by both combinations is the same. The means adopted to attain such result differ only in the location of the several elements and such dependent differences as are made necessary by such change of location.
[*Consolidated Roller Mill Company *v.* Coombs, 253.

3. Mechanical Skill.
Any differences in construction and material between the structure described by the first claim of the Hovey patent and the devices covered by the prior patents and used by the Clay Street Hill Road do not constitute invention, but merely involve ordinary mechanical skill, and are not patentable.
[*National Cable Railway Company *v.* Mt. Adams & Eden Park Inclined Railway Company, 1400.

ISSUE IN INTERFERENCE.

(See Interference, 9.)

JOINDER OF INVENTION.

1. Elements of the Same Machine.
When one particular element of a machine is dependent upon and acts with the other elements thereof to produce a single result, it may be claimed in the same application with them without regard to the Office classification.
[*Ex parte* Coe, 1119.

2. Apparatus Attached.
An apparatus attached to a photographer's lamp for feeding a magnesium spray to the flame may be claimed in the same application with other parts of the lamp.
[*Ex parte* Jlinsky, 1399.

JURISDICTION.

(See Interference, 7.)

LICENSES.

(See Use of Patented Articles.)

MACHINES.

(See Joinder of Invention, 1.)

MANDAMUS.

(See Abandoned Applications, 3, 4.)

MASTER'S REPORT.

1. Measure of Damages—Exceptions to Master's Report.
The master, having found that the complainant had failed to establish by trustworthy legal proof any basis for the computation of profits, stopped his investigations upon the ground that as the defendants had destroyed the complainant's standard there could be no standard until the complainant voluntarily created one.
[*Webster Loom Company *v.* E. S. & N. D. Higgins, 1119.

2. Report Recommitted.
Report recommitted to master, with instructions to estimate the amount of profits in accordance with the rule stated in the opinion of Judge Wallace in a previous case. [*Id.

MEASURE OF DAMAGES.

(See Damages and Profits; Master's Report.)

MECHANICAL SKILL.

(See Invention, 3; Particular Patents, 4, 17.)

METHOD.

(See Interference, 9.)

MOTION FOR ATTACHMENT FOR CONTEMPT.

Practice in the Courts.
Upon a motion for an attachment against the defendants for contempt in violating an injunction granted at final hearing, *Held* that as the present alleged infringing device differs from that adjudged to be an infringement, and also from the patented device, the question presented ought not to be determined upon such a motion as this, but only by an original suit.
[*The Pennsylvania Diamond Drill Company *v.* Simpson *et al.*, 676.

MOTION TO DISMISS AN APPEAL.

(See Interference, 3, 4, 5.)

MOTION TO DISSOLVE AN INTERFERENCE.

(See Interference, 1, 2, 6, 7.)

1. Appeal on Motion to Dissolve an Interference Between an Application and a Patent Issued Inadvertently During the Pendency of that Application.
When an interference is declared between an application and a patent issued inadvertently during the pendency of that application, and the applicant files a motion to dissolve the interference and to stay proceedings without having made any proof of service of notice of said motion upon the opposite party, said motion will not be entertained. (Rule 153.)
[Bechman *v.* Johnson, 678.

2. Same—Rule 94.
The case is the same as if the interference had been declared between two pending applications, and the interference is rightly declared when declared under Rule 94, paragraph 1, without the affidavit called for by Rule 94, paragraph 2.
[Id.

3. Same—Petition.
While a motion to dissolve the interference and suspend proceedings will be refused if made without notice to the opposite party, *Quære*, whether in a case like the present a petition, without notice to the opposite party, to *vacate* the order establishing the interference might not be sustained. [Id.

4. Amendment Pending the Interference.
Pending the interference in such case an amendment which does not come within the terms of Rules 106, 107, 109 will not be received or considered. (Rule 130.) [Id.

OATH.

(See Interference, 1, 2.)

OLD ELEMENTS.

(See Particular Patents, 4, 10, 16.)

PARTICULAR PATENTS.

1. Cross—Packing for Oil-Wells.
The second claim of reissued Letters Patent No. 7,771, granted July 3, 1877, to John R. Cross, for an improvement in packing for oil-wells, obtained 12 years after the date of the original patent, is an undue expansion of the first claim of the original patent.
[*Consolidated Oil Well Packer Company *v.* Galey, 975.

2. Cubley—Banjos.
Banjos made under Letters Patent No. 274,915, granted April 3, 1883, to E. J. Cubley, for improvement in banjos, in which the parchment rests directly on a rim consisting of a metal shell, in form like the old wooden rim, but differing from any rim previously made, and producing by such rim distinctive musical properties, do not infringe Letters Patent issued May 17, 1873, to C. E. Dobson, for an improvement consisting of a ring, either of metal or wood, to ease the wear of the parchment against the rim, and improve the tone of the instrument; nor do they infringe Letters Patent issued November 18, 1881, to Henry C. Dobson, whose improvement consists of a metal ring between the parchment and a rim of wood and metal, and which eases the parchment, as does the ring in the first patent, and produces a metallic musical sound.
[*Dobson *et al. v.* Cubley, 1366.

3. De Quillfeldt—Bottle-Stoppers—Reissues.
Reissue Letters Patent No. 7,722, granted June 5, 1877, to Charles De Quillfeldt, for an improvement in bottle-stoppers, construed, and *Held* that the first claim, when read in connection with the specification and drawings of the original patent, contains the same elements found in the first claim of the original patent, combined and operated in the same way and producing the same results.
[*Putnam *et al. v.* The Keystone Bottle Stopper Company *et al.*, 113.

4. Dowling—Feed Mechanism for Roller-Mills.
Letters Patent No. 269,516, granted December 4, 1883, to Daniel E. Dowling, for an improvement in feed mechanism for roller-mills, *Held* to be an aggregation of old elements adapted to a new machine, but producing practically the same results. No invention involved in putting these devices together and placing them in the hopper of a flouring-mill.
[*The Consolidated Roller Mill Company *v.* Coombs, 255.

5. Eppelsheimer—Clamp Apparatus for Connecting Street-Cars, &c.
Letters Patent No. 180,757, granted March 16, 1875, to William Eppelsheimer, for an improvement in clamp apparatus for connecting street-cars, &c., *Held* to be infringed by the defendant's device.
[*Root *v.* Third Avenue Railroad Company, 674.

6. Gray—Grinding-Mills.
Letters Patent No. 222,893, granted December 23, 1879, to William D. Gray, for an improvement in grinding-mills, construed and sustained, and *Held* that Gray's invention is for such an improvement as to entitle him to a liberal construction of the claims of the patent and a liberal application of the doctrine of equivalents.
[*The Consolidated Roller Mill Company *v.* Coombs, 255.

7. Hovey—Endless-Rope Railways—Anticipation.
The first claim of Letters Patent No. 193,372, granted to Asa E. Hovey September 18, 1877, for improvement in endless-rope traction-railways, which is "the construction and arrangement together of the brackets * * * and rails * * * forming the frame or skeleton for a rope-tunnel for endless-rope traction-railways, said brackets forming a support for the groove-rails and for the planking forming the sides or shell of the tunnel," is void for want of invention, having been anticipated by the Gardner patent, No. 19,736, of March 23, 1858, the Thompson patent, No. 131,913, of October 1, 1872, and the structure used in 1873 by the Clay Street Hill Road, of San Francisco, Cal.
[*National Cable Railway Company *v.* Mt. Adams & Eden Park Inclined Railway Company, 1400.

8. Same—Infringement.
If such first claim could be sustained by limiting its scope, so as to make it cover all of the elements described in the specifications, it is not infringed by the structure used by defendant, the Mt. Adams & Eden Park Inclined Railway Company.
[*Id.

9. Same—Anticipation.
The first branch of the sixth claim of said Letters Patent, in reference to the combination, "with the rope tunnel or chamber, of pulleys journaled in the same, upon which the rope runs," was anticipated by the Gardner patent and is not patentable.
[*Id.

10. Same—Same.
The second branch of the sixth claim, relating to the "means for lubricating the bearings of said pulleys from the outside of the tunnel," lacks invention, and is not patentable, in view of the well-known use of tubes to carry oil to inaccessible journals.
[*Id.

11. Same—Infringement.
Even if such sixth claim were patentable, it is not infringed by defendant, who does not use any oil reservoirs or tubes leading from the outside of the tunnel to the shaft-bearings, such as are covered by said sixth claim.
[*Id.

12. Krementz—Collar-Button.
Patent No. 298,308 granted to G. Krementz May 6, 1884, for a collar or sleeve button having a hollow head and stem, the said head, stem, and the base-plate or back of the said button being shaped and made of a single continuous piece of sheet metal, is void for want of novelty. The Stokes patent, No. 171,382, January 4, 1876, covers a button composed of a single piece of sheet metal, the only difference being that the head is flat and solid instead of round and hollow, like complainant's; and the Keats patent, No. 177,353, May 9, 1876, also covers a button made of a single piece of sheet metal having a hollow head and hollow stem of the same form as complainant's.
[*Krements *v.* Cottle Company, 1775.

13. Leggett—Lining Barrels with Glue.
Reissue Letters Patent No. 5,785, granted March 10, 1874, to Edward W. Leggett, for an improved mode of lining the inside of oil-barrels with glue, the claims for which were a process "wherein the glutinous material, instead of being produced by reduction from a previously solid state, is permitted to attain only a certain liquid consistency, and is then applied to the package and permitted to harden thereon for the first time," and "a barrel, cask, &c., coated or sized by the material, and by the mode or process whereby it is absorbed into and strengthened by the wood fiber," are void for want of invention.
[*Leggett *v.* Standard Oil Company, 1121.

14. Little—Time-Locks—Validity.
The first and seventh claims of reissued Letters Patent No. 8,550, granted January 1, 1879, to the Yale Lock Manufacturing Company, as assignee of Samuel Little, for an improvement in time-locks, *Held* valid, and the seventh claim *Held* not an expansion of the original patent, on the authority of *Yale Lock Co. v. Berkshire Nat. Bank* (17 Fed. Rep., 581) and *Yale Lock Co. v. New Haven Sav. Bank*. (20 Fed. Rep., 167.)
[*Yale & Towne Manufacturing Company *et al. v.* Consolidated Time Lock Company, 1399.

15. Low—Tile Decoration.
Letters Patent No. 336,242 and 336,243, both granted to John G. Low February 16, 1886, for tile decoration, declared void for want of invention.
[*Low *v.* Barstow Stove Company, 202.

16. Lowe—Process and Apparatus for the Manufacture of Illuminating or Heating Gas.
Letters Patent No. 167,847, granted September 21, 1875, to Thaddeus S. C. Lowe, for an improved process and apparatus for the manufacture of illuminating or heating gas, contain a process for the manufacture of water-gas containing but little nitrogen. The presence of nitrogen in illuminating-gas is deleterious, and when it amounts to 9 per cent. or more it amounts to a serious fault. The feature of the process consists in producing the gas in a close chamber—that is, one from which the air is excluded—or by an alternating, as distinguished from a continuous, process. All of the essential apparatus was old, except the fixing-chamber, which is so arranged as to be heated internally by the products of combustion that escape from the generator and envelop the refractory material. *Held* that as the invention introduced a very desirable advantage into the process of making illuminating-gas by which the expense is greatly lessened, the facts that the older inventions which are now claimed to be susceptible of being modified by mere mechanical skill into the one in question remained without modification until the patentee made it, and that his improvement at once commended itself to those skilled in the art, are sufficient to show patentable invention.
[*Guarantee Trust and Safe Deposit Company *et al. v.* New Haven Gas-Light Company, 1661.

17. Marmon—Roller-Mills.
Letters Patent No. 274,508, granted March 27, 1883, to D. W. Marmon, for an improvement in roller-mills, construed, and so much of claim 1 as is not covered by the Gray patent—to wit: "means for adjusting simultaneously both ends of the counter-shaft"—*Held* to be so far anticipated as to involve only mechanical skill.
[*Consolidated Roller Mill Company *v.* Coombs, 255.

18. Martin—Deep-Well Packing.
The fourth claim of reissued Letters Patent No. 7,344, granted July 25, 1876, to Francis Martin, for deep-well packing, compared with the second claim of the original patent, and *Held* to be not an enlargement or expansion of the original claim, but a statement in more clear and precise language of what is contained in the modified language of the original claim. The question of patentable novelty not considered.
[*Consolidated Oil Well Packer Company *v.* Galey, 975.

19. Mussgiller and Schedler—Treating Beer and other Liquids.
Reissue Letters Patent No. 9,129, granted March 23, 1880, upon the application of Friedrich C. Mussgiller and R. W. Schedler, for an improvement in treating beer and other liquids, sustained.
[*Zinsser *et al. v.* Kremer, 114.

20. Robinson and Strong—Packing for Deep Wells.
Reissued Letters Patent No. 8,786, granted July 1, 1879, to John K. Robinson and D. A. Strong, for packing for deep wells, *Held* to be an unwarranted enlargement of the original patent. The thing which was the subject of the original patent and the thing which it is desired to bring within the terms of the reissue are entirely dissimilar.
[*Consolidated Oil Well Packer Company *v.* Galey, 975.

21. Shumard—Sash-Balance.
The novel feature of Letters Patent No. 285,079, granted September 18, 1883, to Warren Shumard, for an improvement in sash-balances, is a brake so arranged as to be adjustable from the outside; and the second and third claims of this patent are infringed by a sash-balance having a band-brake bearing on the periphery of the drum.
[*Coleman Hardware Company *et al. v.* Kellogg, Johnson & Bliss *et al.*, 262.

22. Shumard—Sash-Balance—Infringement.
Patent No. 285,079, granted September 18, 1883, to Warren Shumard, for a sash-balance which has a brake so arranged as to be adjustable from the outside, the brake being an ordinary brake-shoe bearing on the periphery of the drum, with the pressure secured by a spring, is infringed by the use of a band-brake bearing on the periphery of the drum and adjustable from the outside, band-brakes having been well-known equivalents for spring-brakes at the time of the issue of the Shumard patent.
[*Coleman Hardware Company *et al. v.* Kellogg *et al.*, 1266.

23. Vom Hofe—Bottle-Stoppers.
Letters Patent No. 167,141, granted August 24, 1875, to William Vom Hofe, for an improvement in bottle-stoppers, not anticipated by a previous patent to said Vom Hofe, No. 163,533, dated May 18, 1875.
[*Putnam *et al. v.* The Keystone Bottle Stopper Company, *et al.*, 113.

PATENTABILITY.

(See Invention, 3.)

PETITION.

(See Interference, 7.)

PRACTICE IN THE COURTS.

(See Separate Patents; Suits for Infringement; Testimony before Examiner.)

PRACTICE IN THE PATENT OFFICE.

(See Abandoned Applications, 1, 2, 3; Amendments; Appeal to Examiners-in-Chief; Division of Application, 2, 3, 4; Injunction, 2; Interference; Joinder of Invention; Motion to Dissolve Interference.)

PRELIMINARY STATEMENTS.

(See Interference, 1.)

PRIORITY OF INVENTION.

PRIORITY OF INVENTION—LACHES.

When one of the parties to an interference has made the invention independently of the other party and has reduced it to practice upon an extended commercial scale, and has obtained a patent which he has held unchallenged for nearly a year, he must be adjudged the prior inventor as against the other who, though he may have been the first to conceive the invention, without any excuse for his non-action, never did anything toward reducing it to practice, but who bases his claim to priority on a previous application filed by him which contained claims for the invention in controversy, which claims were rejected and positively and deliberately abandoned nearly four years before the filing of the application involved in this interference.

[Beach *v.* Fowler, 821.

PROCESS.

REDUCTION TO PRACTICE.

(See Abandoned Applications, 3; Priority of Invention.)

REHEARING.

(See Amendments.)

REISSUES.

(See Particular Patents, 1, 3, 13, 14, 18, 19, 20.)

1. AMPLIFICATION OF SPECIFICATION IN REISSUE.

While a comparison of the two patents evinces that the specification of the reissue is amplified, yet this amplification is in matters of an explanatory nature and embraces nothing of any importance which is not plainly disclosed in the original specification and accompanying drawings.

[*Putnam *et al. v.* The Keystone Bottle Stopper Company *et al.*, 113.)

2. EXPANSION OF INVENTION—VOID.

Complainant's original patent embraced hair-crimpers of two kinds—one in which the fabric is stitched to the soft-metal core, the other in which the fabric is fastened to the core by a metal fold made by turning over the thin edges of the core, or of a strip of sheet-lead inside the fabric over the core. The original contained the clause: "I also modify my invention in various other equivalent ways, such as would suggest themselves to any intelligent mechanic," &c. The reissued patent contained claims for fastening the fabric to the core by cementing them together. *Held* that the reissue was invalid, being an expansion of the original and embracing a new invention.

[*Philadelphia Novelty Manufacturing Company *v.* Rouss, 1664.

3. SAME—LACHES.

If it be conceded that the inventions claimed in the reissue were described in the original, then, such claims being expansions and more than 2 years having elapsed after the original was granted before the reissue was applied for, the doctrine of laches applies and the delay must be held unreasonable in the absence of explanatory averments in the bill. [*Id.

REJECTED APPLICATIONS.

(See Abandoned Applications, 4, 5.)

RESULT.

(See Infringement, 1.)

ROYALTY.

(See Damages and Profits.)

SEPARATE PATENTS.

(See Division of Application, 1; Suits for Infringement.)

SUITS FOR INFRINGEMENT.

The complainants insist that their position is precisely the same as if they held a single patent with two claims—one for the process or composition of matter producing the coloring-substance, the other for the combination of that substance with paper. This might be so if they could be considered as holding both patents; but in this suit they have carefully abstained from declaring upon the first patent or even in any way referring to it. By not declaring upon it as its present owner, they leave it to the defendant to be availed of as if it were the property of a stranger.

[*Underwood *et al. v.* Gerber *et al.*, 116.

SERVICE OF NOTICE.

(See Motion to Dissolve Interference, 1, 3.)

SPECIFICATIONS.

(See Claims.)

SUBSEQUENT PATENTS.

(See Abandoned Applications, 1, 2.)

SUBSEQUENT PATENTS WITHOUT RESERVATION.

A former patent, No. 265,927, granted October 10, 1882, to Marmon jointly with one Warrington, construed, and *Held* that no one can take out a patent either jointly or severally for an invention, and, after the patent is issued, without reservation in his original application, obtain a second patent with broader claims for the device.

[*Consolidated Roller Mill Company *v.* Coombs, 255.

SUITS FOR INFRINGEMENT.

(See Division of Application, 1; Separate Patents.)

AMENDED BILL.

In a suit to restrain the infringement of a patent complainant was defeated because he sued on one only of two patents relating to the same invention. (48 O. G., 116.) The evidence introduced would be necessary under a bill based on the omitted patent. *Held* that he should be permitted to amend by bringing in the other patent, and alleging its infringement, and that the case should be opened for taking additional testimony, but that relief should be granted only on condition that complainant give an undertaking to pay the expense of such additional testimony, including witness fees, mileage, master's or examiner's fees, and printing.

[*Underwood *et al. v.* Gerber *et al.*, 675.

SUPREME COURT OF DISTRICT OF COLUMBIA.

(See Abandoned Applications, 4, 5.)

TERRITORIAL RIGHTS.

(See Use of Patented Articles, 1, 2.)

TESTIMONY BEFORE EXAMINER.

PRACTICE IN THE COURTS—TESTIMONY BEFORE EXAMINER.

On a motion for the appointment of an examiner to take testimony in an equity cause the court will not limit or restrict the taking of testimony or determine what is proper testimony. Objections taken to evidence on the ground of incompetency or irrelevancy properly come before the court at the final hearing.

[*United States *v.* American Bell Telephone Company and Alexander Graham Bell, 894.

TITLE TO PATENT.

(See Separate Patents.)

TRADE-MARKS.

1. USE OF A PATENTEE'S NAME IN CONNECTION WITH A PATENTED ARTICLE AS DESCRIPTIVE THEREOF DOES NOT CONSTITUTE A TRADE-MARK.

The name which is given to a patented device to distinguish it as a patented article from other articles of the same character is not, properly speaking, a Trade-Mark.

[*Adee *v.* Peck Brothers & Co., 823.

2. SAME—IT DESIGNATES STRUCTURE BUT NOT WORKMANSHIP OR MANUFACTURER.

It designates nothing except that the structure has a definite character as the structure that was patented, and indicates nothing in regard to the character of the workmanship or the person by whom it was manufactured. [*Id.

3. TRADE-MARK DEFINED.

A Trade-Mark is something different from the article itself, which the mark designates, and is a name, mark, or device attached to the article to indicate its origin. [*Id.

4. INFRINGEMENT OF PATENT, NOT OF TRADE-MARK.

The selling by the defendant of valves under the name of "Foley's," or "Foley's Patent Valves and Overflows," signifies that they are the kind of valves invented and patented by Foley, but not that they are the valves which he or his successor is manufacturing. [*Id.

5. TRADE-MARKS—WHAT CONSTITUTES.

The word "Valvoline," compounded and used on packages of lubricating-oils by plaintiffs, and registered as a Trade-Mark, may be used for that purpose, and the use thereof by defendant in the same manner will be enjoined, though defendant uses his own name in connection with the word.

[*Leonard *et al. v.* White's Golden Lubricator Company, 1401.

USE OF PATENTED ARTICLES.

1. USE OF PATENTED ARTICLES — ASSIGNMENTS — TERRITORIAL RIGHTS.

Where an assignment of territorial rights has been made, the subsequent purchase of the patented article from the inventor or a later assignee (with notice) will not entitle the purchaser to use said article within the territory of the first-mentioned assignee.

[*Sheldon Axle Company *v.* Standard Axle Works, 117.

2. FORMER DECISION REVIEWED.

Adams v. Burks (23 O. G., 114) commented upon, and *Held* not to conflict. [*Id.

VALID PATENTS.

Barnes, James W., Newark, N. J., assignor to American Writing Machine Company, Hartford, Conn. Type-writing machine	411,428	Sept. 24	2043	540	48	1686
Barnes, Joshua B., Springfield, Ill. Balanced slide-valve	406,557	July 9	798	216	48	166
Barnes, Joshua B., Springfield, Ill. Spark-arrester	409,344	Aug. 20	1740	459	48	1030
Barnes, Joshua B., assignor of one-half to J. J. Seldner, Baltimore, Md. Dust-collector	407,392	July 23	2074	536 537	48	428
Barnes, William J., Oshkosh, Wis. Signal appliance	406,558	July 9	799	216	48	166
Barnett, Charles H., New York, N. Y. Automatic cock or cut-off for gas-burners	411,566	Sept. 24	2158	571	48	1709
Barney & Kilby *et al.* (See Schlmansky, Otto, assignor.)						
Barnhart, Harvey P. and S. L., Potsdam, N. Y. Means for capping and sealing milk-bottles	411,368	Sept. 17	1870	500	48	1648
Barnhart, Henry M., Marion, Ohio. Crane	410,870	Sept. 10	1135	305	48	1496
Barnhart, Samuel L. (See Barnhart, Harvey P. and S. L.)						
Barnum, Joseph P., assignor to himself, C. Godshaw, and J. S. Cain, Louisville, Ky. Ammonia-soda apparatus	409,382	Aug. 20	1804	475	48	1041
Barr, Benjamin H., Kansas City, Mo. Wheelbarrow	411,319	Sept. 17	1802	488	48	1636
Barr Cash and Package Carrier Company. (See Albach, William H., assignor.)						
Barr, Jacob H. (See Barr, Weaver, and Barr.)						
Barr, Jacob N., Milwaukee, Wis. Contracting-chill	411,369	Sept. 17	1871	500	48	1649
Barr, John N., Milwaukee, Wis. Harness-loop	409,726	Aug. 27	2318	608	48	1145
Barr, John N., assignor of one-half to G. D. Benjamin, Edgar, Nebr. Cash and package carrier	411,636	Sept. 24	2266	602	48	1733
Barr, Samuel W., H. M. Weaver, and J. H. Barr, Mansfield, Ohio.	409,767	Aug. 27	2380	624 625	48	1157
Barraclough, Benjamin, Bradford, England. Twilled woven fabric						
Barradall, Norborne D., Dallas, and A. J. Bradley, Fort Worth, Tex. said Barradall assignor to said Bradley. Automatic printing device	407,631	July 23	2122	552	48	498
Barret, Benjamin T., and R. Nussbeck, Henderson, Ky. Wire-fastener	408,065	July 30	3070	803	48	628
Barrett Battery Company, John A. (See Barrett, John A., assignor.)						
Barrett, Charles A. (See Appleyard and Johnson, assignors.)						
Barrett, John A., Brooklyn, N. Y., assignor to J. A. Barrett Battery Company, Baltimore, Md. Electric measuring-instrument	408,157	July 30	3218	840	48	655
Barrett, John P. (See Hyland, David M., assignor.)						
Barrett, Samuel D. (See Stafford and Barrett.)						
Barrett, Sidney H., Springfield, Mass., assignor to Railway Electric Car Lighting and Signal Company, of New York. Connector for secondary batteries	411,370	Sept. 17	1873	500	48	1649
Barrett, Vasan N., Atlanta, Ga. Cooking-stove	407,149	July 16	1602	441	48	347
Barron, Edwin, London, England. Caster	411,181	Sept. 17	1600	422	48	1597
Barrow, Daniel. (See Sexton, William L., assignor.)						
Barrow, James S., *et al.* (See Goodspeed, Charles P., assignor.)						
Barrow, Marion J., New Bloomfield, Mo. Fence	406,695	July 9	1013	271	48	205
Barry, C. Lawrence, and G. B. Upham, Boston, Mass. Producing dramatic performances	406,252	July 2	312	86	48	62
Barry, Henry, assignor of two-thirds to D. Norton and C. Franke, Chicago, Ill. Animal-trap	407,887	July 30	2802	730	48	578
Barry, James C., Rochester, N. Y. Fire-place grate	407,989	July 30	2962	770	48	607
Barth, Gustav A., assignor to P. Chouteau, St. Louis, Mo. Stock or tool-holder for direct-acting engines	409,659	Aug. 27	2209	581 582	48	1125
Barth, Otto J. (See Hall and Barth.)						
Bartlett, Frank L., Portland, Me. Refining fumes	406,868	July 16	1277	336	48	266
Bartlett, Frank L., Portland, Me. Manufacturing pigments	406,869	July 16	1278	336	48	266
Bartlett, Frank L., Portland, Me. Smelting ores	406,870	July 16	1281	336 337	48	266
Bartlett, Frank L., Portland, Me. Apparatus for the manufacture of pigments	406,871	July 16	1283	337	48	267
Bartlett & Rowell. (See Rowell, Almon B., assignor.)						
Barton, Albert G., Three Rivers, Mich. Field-roller	406,078	July 2	78	22	48	18
Barton, Edwin W., Lawrence, Mass. Roll for Jordan pulp-engines	407,276	July 16	1893	499	48	385
Barton, John (See Hawkins and Barton.)						
Barton, William, Liverpool, county of Lancaster, England. Distance-instrument	407,767	July 30	2617	679	48	544
Bartsch, Edwin. (See Kirkwood, Jay W., assignor.)						
Barwis, Thomas S., Arthabaskaville, Quebec, Canada. Hand-car	406,696	July 9	1014	271	48	205
Bash, David W., assignor to Sandwich Enterprise Company, Sandwich, Ill. Cultivator	406,418	July 9	564	139	48	122
Bashaw, Julian S., Chipley, Fla. Combined car coupling and brake	411,567	Sept. 24	2159	571 572	48	1710
Basin, Henry T., Decaturville, Ohio. Saw gumming and sharpening machine	406,079	July 2	79	22	48	18
Bass, Edward W. H., Quincy, Mass. Machine for cutting webbing	411,415	Sept. 24	1944	518	48	1668
Bassett, Fred. H., Saranac Lake, N. Y. Curtain-fixture	411,765	Sept. 24	2450	649	48	1771
Bassett, Fred. H., Saranac Lake, N. Y. Curtain-fixture	411,766	Sept. 24	2451	649	48	1771
Bast, Johann G., Brooklyn, N. Y. Renewable memorandum-book	409,383	Aug. 20	1808	475 476	48	1041
Batchelor, Telford C., West Kensington, county of Middlesex, and A. Latch, South Shields, county of Durham, England. Splicing wire ropes	411,637	Sept. 24	2268	603	48	1734
Bates, Albert J., Joliet, Ill. Barb-wire machine	406,190	July 2	236	69	48	47
Bates, Charles S. (See Thayer, Clifford P., assignor.)						
Batlle, Emilio, Barcelona, Spain. Vehicle-wheel	411,429	Sept. 24	2045	541	48	1686
Batt, Charles F., Brooklyn, N. Y. Self-locking differential hoist	411,096	Sept. 17	1461	389	48	1569
Battey, Sumter B., New York, N. Y. Gas-lighter	409,727	Aug. 27	2319	610	48	1145
Battin, Henry S., Chicago, Ill. Apparatus for manufacturing gas	410,820	Sept. 10	1066	283	48	1483
Batty, Albert, *et al.*, administrators. (See Batty, Job.)						
Batty, Hannah, *et al.*, administrators. (See Batty, Job.)						
Batty, Job, deceased; H. and A. Batty, Philadelphia, Pa., administrators. Feeding device for carding-machines	407,150	July 16	1604	441	48	347
Bauer, Ferdinand, Brooklyn, N. Y. Pump	410,396	Sept. 3	398	106	48	1347
Bauer, Robert A., assignor of one-half to H. G. Krekel, Grand Rapids, Mich. Bag-string cutter	407,567	July 23	2338	605	48	483
Bauer, Theodor, Munich, Bavaria, Germany. Coke-oven	406,966	July 16	1451	389	48	300
Baughman, James A., assignor of one-half to J. L. Whitford, Charlotte, Mich. Toe-weight	407,768	July 30	2619	679	48	544
Baumann, Alfred F., Watertown, Wis. Guard for rocking-chairs or analogous articles of furniture	409,444	Aug. 20	1890	500	48	1060
Baumer, Anton F., Syracuse, N. Y. Candle	407,051	July 16	1538	403	48	316
Bausch, John J., Rochester, N. Y. Lens-blocking	407,990	July 30	2963	770	48	607
Bayles, James C., New York, N. Y. Pipe or tube	406,392	July 2	435	120	48	87
Baylies, Lawson W., Neola, Iowa. Combined end-gate and scoop-board	407,567	July 23	2347	540	48	463
Beach, George A., Chicago, Ill. Flexible drip-cup for umbrellas	406,020	July 2	3	1	48	3
Beach, George I. (See Benedict, Heman A., assignor.)						
Beall, Fletcher W., Birmingham, Ala. Coupling and uncoupling stick	408,158	July 30	3221	841	48	655

Chester, George T., Lockport, N. Y. Barrel-hoop	406,202	July 2	325	90	48	65
Chesterton, Ernest H., Los Angeles, Cal. Finger-guard	408,912	Aug. 13	1091	287	48	896
Chew, Noah M., Southport, Ind. Plant-setting machine	406,336	July 2	440	122	48	88
Chicago Exhaust and Blow Pipe Company. (See Kutsche, Oswald, assignor.)						
Chilcott, Amon W., Matteon, Ill. Gate	407,060	July 16	1550	406 407	48	318
Childs, Charles H., Cleveland, Ohio. Vapor-burner. (Reissue)	11,024	Aug. 20	2201	579	48	1117
Childs, James. (See Jones, Charles, assignor.)						
Childs, Jesse A., and W. E. Muir, Coushatta, La. Seed-planter and fertilizer-distributer	411,215	Sept. 17	1638	441	48	1608
Chlunock, Frank R., Brooklyn, N. Y. Electric wiring	406,994	July 16	1463	383	48	302
Chisholm, Boyd & White. (See White, Bruce C., assignor.)						
Chisholm, William. (See Dow, Joseph H., assignor.) (Reissue.)						
Chittenden, George R. (See Darby and Chittenden.)						
Chivill, John, assignor to Webster & Comstock Manufacturing Company, Chicago, Ill. Shaft-coupling	408,953	Aug. 13	1148	304	48	908
Chorlton, Isaac, and G. L. Scott, Manchester, county of Lancaster, England. Bed-frame	407,165	July 16	1717	448	48	352
Chonteau, Pierre. (See Barth, Gustav A., assignor.)						
Christeneen, Andrew M., Frisco, Utah Ter. Cradle	406,125	July 2	144	43	48	30
Christian, Edmund. (See Emery and Christian.)						
Christie, John H. (See Sibley, Augustine W., assignor.)						
Christie, John J., assignor of one-half to C. M. Williams, Henderson, Tenn. Automatic buggy-brake	406,817	July 9	1200	319	48	241
Christman, John H., assignor of one-half to L. H. Redfield, Syracuse, N. Y. Bottle-stopper	409,922	Aug. 27	2601	681	48	1199
Christoph, André T., Paris, France. Rectification of alcohol	408,583	Aug. 6	581	.....	48	791
Church, Henry A., Providence, R. I. Combined thread-guide and latch-opener for knitting-machines	406,626	July 9	907	245	48	186
Church, Henry W., Graniteville, Mass. Wool-washing machine	410,312	Sept. 3	272	71	48	1321
Church, Isaac, Toledo, Ohio. Expansion-bolt device	406,564	July 9	809	219	48	168
Church, Isaac, Toledo, Ohio. Expansion-bolt	406,565	July 9	810	219	48	168
Church, Melvin B., Grand Rapids, Mich. Mailing-sheet list	407,640	July 23	2439	632	48	502
Church, Melvin B., Grand Rapids, Mich. Ornamentation of walls	409,012	Aug. 13	1240	.....	48	925
Chute, Charles R., *et al.* (See White, Clarence O., assignor.)						
Cilley, Frank H., Boston, Mass. Construction of metallic structures	411,013	Sept. 17	1342	361	48	1547
Cisco, George W., Montvale, N. J. Car-brake	407,575	July 23	2346	607	48	485
Cisco, George W., Montvale, N. J. Device for operating brakes	407,576	July 23	2347	608	48	485
Ciurcu, Alexandre, Paris, France. Apparatus and means for propelling by reaction	407,394	July 23	2079	538	48	429
Claflin, Frank O., assignor of one-half to T. S. Mann, Boston, Mass. Coin-operated toy	409,923	Aug. 27	2602	682	48	1199
Clapp Automatic Fire-Extinguisher Company. (See Clapp, Joseph, assignor.)						
Clapp, Joseph, Evanston, Ill., assignor to Clapp Automatic Fire-Extinguisher Company, of Illinois. Automatic valve	406,087	July 2	90	27	48	30
Clapp, Joseph, Evanston, assignor to Clapp Automatic Fire-Extinguisher Company, Chicago, Ill. Automatic fire-extinguishing apparatus	406,088	July 2	93	27	48	31
Clare, John, Imogen, Iowa. Cultivator	408,594	Aug. 13	765	200	48	832
Clark, Albert M. (See Wheeler and Clark.)						
Clark, Alvin B., assignor of one-half to O. T. Knode, Richmond, Ind. Harmonica-holder	411,374	Sept. 17	1877	502	48	1650
Clark, Asa, *et al.* (See Ashley, Charles A., assignor.)						
Clark, Charlemagne. (See Clark, Edwin M. and C.)						
Clark, Cynthia J., *et al.* (See Clark, Jasper, assignor.)						
Clark, E. Clinton. (See Eastwick, Edward P., assignor.)						
Clark, Edward. (See Armstrong, Clark, and Cottrell.)						
Clark, Edward S., *et al.*, executors. (See Taft, Gustavus E.)						
Clark, Edwin M. and C., Detroit, Mich. Surface cattle-guard	408,695	Aug. 13	767	201	48	838
Clark, Finley Y., Saratoga, N. Y. Bottle-stopper	409,924	Aug. 27	2603	682	48	1200
Clark, Franklin D., and F. Rice, Waukesha, Wis.; said Rice assignor to said Clark. Automatic cut-off	406,877	July 16	1293	339	48	269
Clark, Franklin S., Wilmington, N. C. Retort for distilling wood and making charcoal	407,166	July 16	1719	449	48	352
Clark, George W., Johnstown, Ohio. Brace for fence or gate posts	407,330	July 23	1970	513	48	410
Clark, George W., Boston, Mass., assignor of one-half to Automatic Heater Company, Portland, Me. Vapor-generator	411,712	Sept. 24	2379	631	48	1756
Clark, Hardy M., J. Taylor, and J. B. Henshaw, Manning, Iowa; said Taylor assignor to said Clark and Henshaw. Steam-generator	410,267	Sept. 3	196	52	48	1308
Clark, James H., Flatbush, assignor to C. E. Harris, Brooklyn, N. Y. Car-brake	408,794	Aug. 13	909	243	48	861
Clark, Jasper, assignor to T. C. Northcott and C. J. Clark, Elmira, N. Y. Combined punch and shears	407,167	July 16	1721	449	48	352
Clark, Jay W. (See McPherson, Henry, assignor.)						
Clark, John B. (See Croker, George H., assignor.)						
Clark, Thomas, Philadelphia, Pa. Corner-block for billiard and pool tables	408,584	Aug. 6	583	151	48	791

INDEX OF PATENTS ISSUED FROM THE

Alphabetical list of patentees, July to September, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Clark, Thomas R., *et al.* (See Flagg, Thomas J., assignor.)						
Clark, William P., Elberton, Ga. Cotton-chopper	407,512	July 23	2251	581	48	463
Clark, William S., Philadelphia, Pa. Apparatus for testing and disinfecting drain or soil pipes	409,013	Aug. 13	1241	328	48	925
Clark, William S., Philadelphia, Pa. Drain and soil pipe	409,014	Aug. 13	1243	328	48	925
Clarke, Robert, Gravesend, N. Y. Bottle-trap	408,215	Aug. 6	19	4	48	681
Clarkson, George H. (See Spiegel, William G., assignor.)						
Clause, John J., Chicago, Ill. Rotary printing-machine	410,576	Sept. 10	671	179	48	1406
Claussen, Edward E. (See Lorens, William A., assignor.)						
Claussen, Edward E. (See Lorens and Claussen.)						
Claussen, Edward E., Hartford, and G. Mortson, Bridgeport, Conn. Paper-bag machine	411,544	Sept. 24	2122	{560 561	48	1703
Clayton, George W., Cleveland, Ohio. Hydraulic elevator	410,583	Sept. 3	604	162	48	1367
Clayton, Herbert F., and G. H. Holdroyd, Huddersfield, county of York, England. Filter	409,273	Aug. 20	1640	434	48	1010
Clayton, John, and J. Abraham, New York, N. Y. Card-holder	406,196	July 2	243	67	48	48

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Collis, Fred L., Freedom, Ill. Corn-husker and feed-cutter	408,099	July 2	97	28	48	21
Collis, John, Des Moines, Iowa. Pipe-hanger	411,318	Sept. 24	2067	551	48	1665
Collyer, Robert H., assignor to E. A. Blakely, New Orleans, La. Cotton-seed cleaner	408,085	July 30	3092	810	48	633
Colt, James B., New York, N. Y. Magic lantern	411,092	Sept. 17	1471	390	48	1571
Colville, John, Brunswick, Ga. Machine for boring and trimming slats	410,784	Sept. 10	1015	{272 273	48	1471
Comer, John, assignor of three-fourths to R. Berger, E. Aldersley, Anderson, and F. H. Deakin, Redding, Cal. Lubricator for shaft-bearings	407,771	July 30	2032	679	48	544
Comey, Robert H., Camden, N. J. Machine for tying skeins of yarn, &c	408,216	Aug. 6	19	5	48	682
Commercial Telegram Company. (See Healy, Clarence L., assignor.)						
Comstock, Harry, assignor to Hunter & Comstock Arms Company, Fulton, N. Y. Breech-loading gun	409,017	Aug. 13	1245	329	48	926
Comstock, Willie S., Binghamton, N. Y. Dado-guide	410,319	Sept. 3	334	88	48	1333
Condon, Samuel E., assignor to himself, M. Mickleborough, and N. W. Pratt, Brooklyn, N. Y. Tool for cutting out boiler-tubes	408,162	July 30	3026	842	48	656
Conestoga Cigar Company. (See Abraham, John H., assignor.)						
Conkle, Andrew, Jr., assignor of two-thirds to A. V. and J. H. McVicker, Babb, Ga. Guano-distributer	411,545	Sept. 24	2126	561	48	1703
Conklin, Dewitt C., *et al.* (See Carley, Oliver F., assignor.)						
Conklin, Nathaniel A., Brooklyn, N. Y. Apparatus for elevating water	406,880	July 16	1296	340	48	269
Conkling, Gurdon, Glens Falls, N. Y. Magnetic separator. (Reissue)	11,012	July 16	1942	{505 506	48	396
Conkling, Gurdon, Glens Falls, N. Y. Separating magnetic from non-magnetic particles	410,876	Sept. 10	1142	{307 308	48	1497
Conkling, Gurdon, Glens Falls, assignor to Conkling Ore Dephosphorizing Company, New York, N. Y. Magnetic separator	406,337	July 2	441	122	48	89
Conkling, Gurdon, Glens Falls, assignor to Conkling Ore Dephosphorizing Company, New York, N. Y. Magnetic separator	410,877	Sept. 10	1143	308	48	1497
Conkling Ore Dephosphorizing Company. (See Conkling, Gurdon, assignor.)						
Conley, Edward, Boston, Mass. Beating-engine for paper-pulp	407,641	July 23	2439	632	48	502
Conly, John. (See Keller and Conly.)						
Connee, James, Port Arthur, Ontario, Canada. Automatic weighing-scales	407,170	July 16	1725	450	48	353
Conn, Charles G., Elkhart, Ind. Clarionet	410,072	Aug 27	2831	743	48	1241
Conner, John R. (See Lincoln, George E., assignor.)						
Connett, Martin L., Bellefontaine, Ohio. Calipers and dividers	409,828	Aug. 27	2475	647	48	1173
Connett, Martin L., Bellefontaine, Ohio, assignor, by mesne assignments, to M. F. Connett and J. H. Morse, Kansas City, Mo. Fabric-turning implement	409,139	Aug. 13	1436	{377 378	48	963
Connett, Matthew F., *et al.* (See Connett, Martin L., assignor.)						
Connolly, John B., Minneapolis, Minn. Horse-collar	409,158	Aug. 13	1472	388	48	970
Conover, Stewart. (See Willson and Conover.)						
Conrad, Martin, and C. Hots, Chicago, Ill. Wagon-gear	409,829	Aug. 27	2475	{647 648	48	1173
Conrad, William C. (See Thiele, Felix, assignor.)						
Conrey, James C., Pittsburg, Pa., assignor of one-half to Union Water Meter Company, of Massachusetts. Cross for gas mains or pipes	408,826	Aug. 13	959	255	48	871
Consolidated Coupling Company. (See Barnes, David L., assignor.)						
Consolidated Temperature Controlling Company. (See Butz, Albert M., assignor.)						
Cook, Allen. (See Gregory, Albert A., assignor.)						
Cook, Edward M., New York, N. Y. Apparatus for drying or otherwise treating materials	408,217	Aug. 6	21	5	48	687
Cook, Erwin A., McComb, assignor of one-half to H. W. Doty, Findlay, Ohio. Accelerating the flow of natural gas from gas-wells	408,652	Aug. 6	699	177	48	811
Cook, Frederic, New Orleans, La. Bagasse-furnace	408,587	Aug. 6	586	153	48	792
Cook, Frederic, New Orleans, La. Bagasse-furnace	408,588	Aug. 6	588	153	48	792
Cook, Frederick W., San Francisco, Cal. Saw-mill set-works	410,340	Sept. 3	335	88	48	1334
Cook, Frederick W., assignor of one-half to H. P. Gregory & Co., San Francisco, Cal. Gang-edger	410,315	Sept. 3	281	72, 73	48	1323
Cook, George W., assignor of one-third to C. C. Canny, Detroit, Mich. Underground conduit for electrical conductors	406,818	July 9	1201	319	48	241
Cook, Henry C., Mount Joy, Iowa. Band-cutter and feeder	410,785	Sept. 10	1018	273	48	1473
Cook, Horace W. (See Creaby and Cook.)						
Cook, James, Darlington, S. C. Combined needle-threader and thread-cutter	411,325	Sept. 17	1808	483	48	1637
Cook, Sidney, assignor to himself and W. M. Ogilvie, Orlando, Fla. Roller-colter	407,062	July 16	1552	407	48	319
Cook, Thomas P., assignor of one-half to L. M. Tucker, Columbus, Miss. Spring-motor	410,137	Aug. 27	2935	771	48	1261
Cooke, Augustus R., Syracuse, N. Y. Stop-motion for dental engines	407,950	July 30	2906	757	48	597
Cooke, Ernest W., Chicago, Ill., assignor of one-third to C. P. Warren. Measuring apparatus for filling street-lamps	411,375	Sept. 17	1878	502	48	1650
Cooke, Joseph S. (See Totten, Francis E., assignor.)						
Cooke, Watts, and D. Carlough, Paterson, N. J. Apparatus for upsetting eye-bars	406,501	July 9	715	197	48	151
Cookson, Frederick N., Wolverhampton, England. Feeding mechanism for sewing-machines	411,491	Sept. 24	2046	{541 542	48	1687
Cooley, Charles H., Hartford, Conn. Regulator for grain-scales	410,138	Aug. 27	2938	772	48	1261
Cooley, Charles H., assignor to Pratt & Whitney Company, Hartford, Conn. Regulator for grain-scales	409,669	Aug. 27	2235	587	48	1130
Cooley, Orville, and E. Pridmore, assignors to Johnston Harvester Company, Batavia, N. Y. Grain-binding harvester	408,163	July 30	3228	842	48	656
Cooley, Orville, E. Pridmore, and H. M. Johnston, assignors to Johnston Harvester Company, Batavia, N. Y. Self-binding harvester	406,502	July 9	716	197	48	151
Coombs, Vinton. (See Tebbs, Lane, and Coombs.)						
Coon, James V. D., *et al.* (See Morian, Carlos C., assignor.)						
Coon, John B., Cold Spring, Mo. Combined seeder and harrow	406,881	July 16	1297	340	48	269
Cooper, Alfred J., Duryea, Pa. Mining-machine	409,772	Aug. 27	2389	627	48	1156
Cooper, Alfred J., and E. E. Wigzell, London, England. Electric registering deep-sea sounder	410,786	Sept. 10	1020	274	48	1473
Cooper Boiler and Engine Company. (See Cooper, George D., assignor.)						
Cooper, Charles B., New York, N. Y. Pipe elbow or section	409,631	Aug. 20	2167	571	48	1111
Cooper, Charles B., assignor to W. F. Wallace and H. E. Cooper, New York, N. Y. Making pipe-elbows	410,534	Sept. 3	605	162	48	1367
Cooper, Charles J., Moline, Ill. Harness-saddle	408,827	Aug. 13	960	255	48	871
Cooper, Daniel, Grand Rapids, Mich. Car-coupling	410,579	Sept. 10	675	180	48	1407
Cooper, George D., assignor to Cooper Boiler and Engine Company, St. Johns, Mich. Steam-generator	407,395	July 23	2061	538	48	430
Cooper, George W. (See Giles, Stephen, assignor.)						
Cooper, Henry, Jersey City, N. J. Coin-freed striking-machine	409,453	Aug. 20	1902	{503 504	48	1062

Alphabetical list of patentees, July to September, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drg.	Official Gazette. Vol.	Official Gazette. Page.
Cooper, Henry, Brooklyn, and J. P. O'Brien, assignors of one-half to B. Van Leer, New York, N. Y. Coin-operative blow-testing machine	410,402	Sept. 3	411	116	48	1349
Cooper, Hugh E., *et al.* (See Cooper, Charles B., assignor.)						
Cooper, William H., assignor to M. Seward & Son, New Haven, Conn. Perch-bearing for fifth-wheels	409,561	Aug. 20	2052	541	48	1091
Cooperative Foundry Company. (See Brayer, John F., assignor.)						
Cope, Oliver, assignor of one-third to J. Otis, San Francisco, Cal. Cable-railway brake	407,171	July 16	1796	456 / 451	48	353
Copeland, David W., Syracuse, N. Y. Cash-carrier apparatus	406,627	July 9	908	245	48	186
Copeland, Lucius D., Camden, N. J. Stuffing-box	406,892	July 16	1299	341	48	270
Corbin Cabinet Lock Company. (See Camp, Bushrod H., assignor.)						
Corbin, P. & F. (See Case, Cromwell O., assignor.)						
Corbin, P. & F. (See Fagan, Robert, assignor.)						
Corbin, P. & F. (See Leach, Henry, assignor.)						
Corbus, John. (See Mets, Frank, assignor.)						
Corcoran, Andrew J., Jersey City, N. J. Windmill	411,581	Sept. 24	2180	570	48	1714
Corder, William J., Orange, Tex. Lubricant	406,883	July 16	1299	.....	48	270
Cordrey, Thomas P., Canton, Ohio. Steam fruit-canner	409,274	Aug. 20	1641	434	48	1010
Corell, Abram O., Charlotte, Mich. Fence-bracket	409,172	Aug. 20	1496	396	48	982
Corey, David A. (See Luscomb and Corey.)						
Corey, John A., Rockville, R. I. Saw-handle	407,333	July 23	1974	514	48	410
Corley, John W. (See Stovel and Corley.)						
Corliss, Emily A., administratrix. (See Corliss, George H.)						
Corliss, George H., deceased; E. A. Corliss, Providence, R. I., administratrix. Adjustment of gibs of cross-heads of steam-engines	406,091	July 2	98	29	48	21
Cornelius, Nicholas, assignor of two-thirds to H. Stanley and E. C. Teuscher, St. Louis, Mo. Flour-mill	410,878	Sept. 10	1144	309	48	1498
Cornelius, Nicholas, assignor of two-thirds to H. Stanley and E. C. Tuescher, St. Louis, Mo. Flour-mill	410,879	Sept. 10	1146	309	48	1498
Cornell Engine Company. (See Cornell, Lewis T., assignor.)						
Cornell, Lewis T., assignor to Cornell Engine Company, Chicago, Ill. Gas-engine	406,265	July 2	326	90, 91	48	66
Cornell, Stephen E., Brooklyn, N. Y. Box or canister	408,954	Aug. 13	1149	304	48	908
Cornell, William H., Titusville, Pa. Sectional screw conveyer	409,454	Aug. 20	1905	508	48	1063
Cornillie, Charles P. (See Cornillie, Edward A. and C. P.)						
Cornillie, Edward A. and C. P., Milwaukee, Wis. Knockdown table	409,930	Aug. 27	2611	682	48	1201
Cornwall, John B., assignor to Barnard & Leas Manufacturing Company, Moline, Ill. Rotary bolt	409,632	Aug. 20	2168	571	48	1112
Cornwall, John B., assignor to Barnard & Leas Manufacturing Company, Moline, Ill. Corn-cleaner	411,759	Sept. 24	2441	646 / 647	48	1769
Cornwall, John B., and H. A. Barnard, assignors to Barnard & Leas Manufacturing Company, Moline, Ill. Split pulley	409,140	Aug. 13	1439	378	48	904
Cornwell, Charles, assignor of one-half to H. C. Dunlap, Philadelphia, Pa. Steam-trap	406,264	July 2	328	91	48	66
Corrigan, Patrick D., assignor of one-half to J. W. Gallman, Wellsville, N. Y. Window	410,535	Sept. 3	606	160	48	1367
Cosby, Anderson B. (See Dudley and Cosby.)						
Cosgrave, James B., Binghamton, N. Y. Bottle-stopper	408,872	Aug. 13	1031	273	48	885
Cossey, Michael, Forestville, Iowa. Brake for vehicles	406,628	July 9	909	245	48	186
Costa, Louis. (See Repetti, Joseph, assignor.)						
Cottrell, Calvert B., Stonington, Conn. Stop-cylinder printing-machine	407,172	July 16	1728	451 / 452	48	353
Cottrell, George. (See Armstrong, Clark, and Cottrell.)						
Cottrell, Herbert, Newark, N. J. Apparatus for vaporizing oil	406,503	July 9	719	197 / 198	48	151
Cottrell, Herbert, Newark, N. J. Vaporizing oil	406,504	July 9	722	198 / 199	48	152
Cottrell, William H., *et al.* (See Morrison, Horatio B., assignor.)						
Coughlin, William H., assignor of one-half to H. H. Fairbanks, Worcester, Mass. Instrument for connecting line-wires	411,093	Sept. 17	1472	390	48	1571
Coughtry, John W., Cigarville, N. Y. Cigar-bunching machine	410,268	Sept. 3	198	53	48	1308
Coulter, George A., assignor of one-half to J. C. Ish, Omaha, Nebr. Electric horse-disconnector	406,629	July 9	911	246	48	187
Coulter, J. W., *et al.* (See Roundtree, John T., assignor.)						
Coupal, Joseph. (See Coupal, Peter A. and J.)						
Coupal, Peter A., Boston, and J. Coupal, Quincy, Mass. Seam-finishing machine	410,636	Sept. 10	766	207	48	1425
Courtney, Cyrus W., Bliss, Idaho Ter. Car-coupling	406,884	July 16	1300	341	48	270
Couteau, Jules, Béziers, Hérault, France. Adjustable garment-pattern	406,197	July 2	244	67	48	48
Cowan, Charles B. (See Ash, Joseph S., assignor.)						
Cowan, Stephen G. (See Freeman, Potts, and Cowan.)						
Cowdery, Warren H. (See Silliman and Cowdery.)						
Cowell, Julius J., assignor of two-thirds to C. J. Brown and C. D. Olney, Weedsport, N. Y. Miter-machine	409,455	Aug. 20	1906	504 / 505	48	1063
Cowie, James, Leisenring, Pa. Safety attachment for elevators	406,630	July 9	912	246	48	187
Cowles, George C., assignor of one-half to E. Germain, East Saginaw, Mich. Drive-pulley (Reissue)	11,020	Aug. 6	734	190 / 191	48	819
Cowley, Covel R., Wyoming, and L. H. Cowley, assignors of one-third to W. A. Sutherland, Rochester, N. Y. Motor for land-carriages	410,536	Sept. 3	607	163	48	1367
Cowley, Leonard H. (See Cowley, Covel R. and L. H.)						
Cox, Albert. (See Foster, Andrew T., assignor.)						
Cox, Frank P., Terre Haute, Ind. Arc lamp	411,713	Sept. 24	2380	632	48	1757
Cox, Jacob D., Jr., assignor to Cox & Prentiss, Cleveland, Ohio. Machine for back-clearing twist-drills	407,577	July 23	2349	625 / 626	48	485
Cox, Jacob D., Jr., assignor to Cox & Prentiss, Cleveland, Ohio. Mechanism for back-clearing twist-drills	407,721	July 23	2542	696	48	522
Cox, Patrick, Rochester, N. Y. Machine for marking soles	410,316	Sept. 3	284	73, 74	48	1324
Cox, Patrick, Rochester, N. Y. Apparatus for molding spring-heels of soles	410,317	Sept. 3	285	74	48	1324
Cox & Prentiss. (See Cox, Jacob D., Jr., assignor.)						
Cox, Stephen J. (See Townsend, Eli C., assignor.)						
Coyle, Andrew M., Washington, D. C. Dry closet	408,066	July 30	3094	811	48	633
Coyle, Edward S., Ballston, N. Y. Axle-lubricator	408,018	Aug. 13	1248	330	48	926
Coyne, Thomas F., Brooklyn, N. Y. Sink-back	406,198	July 2	245	67, 68	48	49
Crabtree, James, Heckmondwike, county of York, England. Chenille fabric	409,931	Aug. 27	2612	684	48	1201
Crafts, Perry F., Leeds, Mass. Hand-hold	405,995	July 16	1464	383	48	302
Craig, Frank P., Holton, Kans. Cultivator	406,589	Aug. 6	589	153	48	792
Craig, James D., Rogers Park, Ill., assignor to Keyless Lock Company, of Illinois. Combination-lock	408,795	Aug. 13	910	243	48	861

Alphabetical list of patentees, July to September, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drg.	Official Gazette. Vol.	Official Gazette. Page.
Craig, William S., assignor to National Cash Register Company, Dayton, Ohio. Cash indicator and register	406,498	July 9	580	163 / 164	48	125
Craighead & Kintz Company. (See Kintz, Joseph, assignor.)						
Craigie, Hugh H., Stamford, Conn. Water-closet tank	408,218	Aug. 6	24	5	48	682
Craigie, Hugh H., New York, N. Y. Water-closet	410,369	Sept. 3	202	53, 54	48	1309
Crain, James H., Mounds Junction, Ill. Fence	410,494	Sept. 3	555	149	48	1377
Cramberg, George G., and J. H. Ranck, Dallas City, Ill. Harness	407,852	July 30	2750	715	48	567
Crandal, Mary E., Hyde Park, and E. B. Reeme, Chicago, Ill. Dress-shield	409,173	Aug. 20	1497	397	48	982
Crandal, Henry F., assignor to M. Lyman, Waverly, N. Y. Game or puzzle	410,956	Sept. 10	1252	337	48	1520
Crandall, Charles M., assignor to M. Lyman, Waverly, N. Y. Game or puzzle	407,063	July 16	1554	407 / 408	48	319
Crandall, Henry F., assignor to Milwaukee Harvester Company, Milwaukee, Wis. Harvester	408,463	Aug. 6	387	101 / 102	48	755
Crandall, Henry F., assignor to Milwaukee Harvester Company, Milwaukee, Wis. Reel-adjusting mechanism for harvesters	411,643	Sept. 24	2277	605	48	1735
Crandall, Jesse A., Brooklyn, N. Y. Hobby-horse						
Crandall Type Writer Company. (See Brott, Lucien A., assignor.)						
Crandall Type Writer Company. (See Twiss, Freeman L., assignor.)						
Crane & Co., J. S. (See Crane, John S., assignor.)						
Crane, Edward B., California, Mo. Vulcanizer	410,073	Aug. 27	2831	743	48	1241
Crane, Erastus W., *et al.* (See McNaughton, Peter, assignor.)						
Crane, John S., assignor to J. S. Crane & Co., Lake Village, N. H. Knitting-machine	410,495	Sept. 3	556	149	48	1377
Crane, Richard T., Chicago, Ill. Stuffing-box for valves	411,425	Sept. 24	1961	521	48	1670
Crane, Thomas S., East Orange, N. J., assignor to E. Bradley, New York, N. Y. Machine for cutting boards from logs	410,403	Sept. 3	414	110 / 111	48	1350
Crane, Zenas, Jr., Dalton, Mass. Finishing paper	406,505	July 9	794	199	48	152
Cranford, Henry L. (See Richardson, Clifford, assignor.)						
Cranson, Giles S., Silver Creek, N. Y. Grain-scourer	407,578	July 23	2351	609	48	486
Cranson, Giles S., Silver Creek, N. Y. Grain-scourer	407,722	July 23	2544	659	48	522
Craus, Henry S., Mount Vernon, N. Y. Attachment for ladies' satchels	406,996	July 16	1466	383	48	302
Craven, John R., Cincinnati, Ohio. Truck for carrying brick-pallets	406,885	July 16	1301	341	48	270
Craver, Steele & Austin. (See Pettit and Lottridge, assignors.)						
Crawford, James G., Boston, Mass. Starching-machine	409,019	Aug. 13	1249	330	48	927
Crawley, James E., Whitewater, Wis. Water heater and condenser	406,265	July 2	330	91	48	66
Crawley, James E., St. Louis, Mo. Metal wheel	406,705	July 9	1025	274	48	207
Crecelius, Louis J., St. Louis, Mo. Lifting-jack	407,173	July 16	1730	452	48	354
Crecelius, Louis J., assignor to A. Warren, St. Louis, Mo. Lifting-jack	407,174	July 16	1732	452	48	354
Crecelius, Louis J., assignor to A. Warren, St. Louis, Mo. Lifting-jack	410,074	Aug. 27	2832	743	48	1242
Crecelius, Louis J., assignor to A. Warren, St. Louis, Mo. Lifting-jack	406,506	July 9	795	199	48	152
Cree, James T., Worcester, Mass. Shuttle-motion for looms						
Crepeau, Ferdinand, *et al.* (See Virnoche, Maxime, assignor.)						
Crepe, La Fayette, Sheridan Lake, Colo. Mail-bag fastener	407,858	July 30	2751	716	48	568
Creque, Allen P., New York, N. Y. Apparatus for heating and purifying water	407,819	July 30	2703	701	48	559
Cresap, Charles W., Eyota, Minn. Bob-sleigh	406,028	July 2	12	4	48	5
Cridge, Alfred H., New York, N. Y. Implement for separating checks, tickets, &c	406,199	July 2	246	68	48	49
Criley, John M., Loveland, Ohio. Butter press or printer	409,734	Aug. 27	2351	613	48	1148
Critchlow, John M., Beaver Falls, assignor of one-half to E. T. Roberts, Titusville, Pa., and H. McKay, London, Canada. Apparatus for the manufacture of gas	406,819	July 9	1202	319	48	241
Crittenden, Simeon, Chatfield, Minn. Butter-package	409,318	Aug. 20	1711	450	48	1023
Crocker, William O. and W. P., Turner's Falls, Mass., assignors of one-half to New England Fibre Company, of Massachusetts. Digester	406,886	July 16	1302	341	48	270
Crocker, William P. (See Crocker, William O. and W. P.)						
Crofford, Warren K. (See Bardsley and Crofford.)						
Crofford, Warren K., New York, N. Y., assignor of one-third to W. Bardsley, Kearney Township, N. J. Paper-clip for writing-tablets	410,560	Sept. 10	676	181	48	1407
Croft, Henry, Jr. (See Mast and Croft.)						
Croker, George H., Seacombe, county of Chester, assignor of one-half to J. B. Clark, Liverpool, England. Machine for delinting cotton-seed	406,798	Aug. 13	916	244	48	862
Crompton Loom Works. (See Wyman, Horace, assignor.)						
Crompton Loom Works. (See Wyman and Gale, assignors.)						
Cronk, William S., Apopka, Fla. Washing-machine	408,797	Aug. 13	918	244	48	862
Crook, Charles, Brooklyn, N. Y. Straw-board-lining-cutter machine	407,467	July 23	2197	566	48	452
Crook, Joseph E., assignor of one-half to A. T. Wall & Co., Providence, R. I. Ornamental chain	407,723	July 23	2545	659	48	523
Crook, Samuel H., assignor of one-half to I. Bremer, New York, N. Y. Window-cleaning chair	410,957	Sept. 10	1253	337	48	1520
Crosby, Adon D., Cuba, N. Y. Bucket for chain-pumps	409,592	Aug. 20	2054	541	48	1091
Crosby, Charles H., and H. W. Cook, Boston, Mass. Cover for cooking-vessels	411,185	Sept. 17	1607	427	48	1296
Crosby Steam Gage and Valve Company. (See Moody and Bosworth, assignors.)						
Cross, George H., St. Johnsbury, Vt. Dough-machine	410,350	Sept. 3	336	88	48	1334
Cross, Jerome A., Fultonville, N. Y. Hay-carrier	407,924	July 30	2802	746	48	586
Cross, William C., Boston, Mass. Lasting boots and shoes	406,338	July 2	442	123	48	89
Crossley, William J., Openshaw, Manchester, county of Lancaster, England, assignor to Gas-Motoren-Fabrik-Deuts, Deutz-on-the-Rhine, Germany. Compound gas or oil motor-engine	406,706	July 9	1026	274 / 275	48	207
Crouch, George, New York, N. Y. Nail for trunks, &c	407,468	July 23	2198	567	48	453
Crouch, William T. (See Sherman and Crouch.)						
Crowell, George G., Cincinnati, Ohio. Tool for dressing abrasive surfaces	410,581	Sept. 10	677	181	48	1408
Crowley, Charles F. (See Heitman, Henry, assignor.)						
Crowner, States R., assignor of one-half to W. J. Miles, Newell, Iowa. Steam-generator	407,469	July 23	2199	567	48	453
Crowther, John, Elmwood Place, Ohio. Cable-guide pulley	406,820	July 9	1203	320	48	242
Crozier, George W., Muncie, Ind. Gas-pressure regulator	408,873	Aug. 13	1032	273	48	885
Cruft, Charles A., London, England, assignor to Spratts Patent, (America,) (limited,) New York, N. Y. Knockdown bench for dogs, &c	408,464	Aug. 6	289	102	48	756
Cruickshank, Alexander, Weston, Ontario, Canada. Lumber-measure	407,175	July 16	1732	453	48	355
Cubley, Edwin J., Ravenswood, Ill. Drum	407,579	July 23	2352	609	48	486
Culmer, John W., assignor to J. H. Logan, New Brighton, Pa. Gas-meter	409,275	Aug. 20	1642	435	48	1010
Culp, Peter, Garrett County, Md. Hen's nest or coop	408,998	Aug. 13	961	255	48	871
Cummings, William F., and H. C. McDuffee, Bradford, Vt. Seed-planter	408,378	Aug. 6	258	64, 65	48	729
Cummins, George W., and J. H. Coleman, New Haven, Conn. Preventing the oxidation of metals while in a heated condition	409,276	Aug. 20	1648	435	48	1012

Alphabetical list of patentees, July to September, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drgs.	Official Gazette. Vol.	Official Gazette. Pages.
Cunningham, James F., Sr., Anson, Tex. Cotton-harvester	406,366	July 2	331	91, 92	48	67
Cunningham, John H., Chelsea, Mass. Sectional metal pole	406,379	Aug. 6	960	6	48	729
Cunningham, William E., assignor to Wallace Manufacturing Company, Frankfort, Ind. Clay-working machine	408,337	Aug. 6	199	51	48	718
Cunningham, William R., assignor to Wallace Manufacturing Company, Frankfort, Ind. Brick-machine	409,348	Aug. 20	1757	402	48	1032
Cunningham, William R., assignor to Wallace Manufacturing Company, Frankfort, Ind. Machine for cutting brick or other clay products	411,546	Sept. 24	2127	509, 510, 511	48	1704
Curl, Jesse B., assignor of one-half to A. Anderson, Des Moines, Iowa. Vapor-burning stove	410,537	Sept. 3	608	169, 170	48	1388
Curley, Thomas, assignor of one-half to W. Bailey, Troy, N. Y. Ball-and-socket joint for steam-pipe connections	409,277	Aug. 20	1650	435	48	1012
Curran, John J., Toledo, Ohio. Water-filter	406,126	July 2	145	49	48	31
Currie, John W., Solomon City, Kans. Windmill	409,932	Aug. 27	2613	624, 625	48	1901
Currie, Stanley C. C., Philadelphia, Pa., assignor to United Electric Improvement Company, Gloucester, N. J. Insulating-plate for secondary batteries	406,267	July 2	333	92	48	67
Currie, Stanley C. C., Philadelphia, Pa., assignor to United Electric Improvement Company, Gloucester, N. J. Cut-out	406,268	July 2	334	92	48	67
Currie, Stanley C. C., Philadelphia, Pa., assignor to United Electric Improvement Company, Gloucester, N. J. Dynamo-armature	406,429	July 9	582	164	48	126
Currie, Stanley C. C., Philadelphia, Pa., assignor to United Electric Improvement Company, Gloucester City, N. J. Electric motor	408,590	Aug. 6	591	133, 134	48	792
Currie, Stanley C. C., Philadelphia, Pa., assignor to United Electric Improvement Company, Gloucester City, N. J. Apparatus for automatically charging secondary batteries	410,153	Sept. 3	22	7	48	1273
Currier, James H. (See Blount, Kempster, Currier, and Dore.)						
Curtice Brothers Company. (See Curtice, Simeon G., assignor.)						
Curtice, Henry J., *et al.* (See Smith, John R., assignor.)						
Curtice, Jesse M., Louisville, Ky. Churn	409,020	Aug. 13	1251	330, 331	48	927
Curtice, Simeon G., Rochester, N. Y., assignor to Curtice Brothers Company, of New York. Packing-case for bottles	410,496	Sept. 3	557	150	48	1377
Curtice, William H., assignor to Portable Fan Company, Louisville, Ky. Portable fan	410,497	Sept. 3	558	150	48	1378
Curtin, Cornelius J., High Falls, N. Y. Rolls	408,219	Aug. 6	26	6	48	6:3
Curtin, Cornelius J., High Falls, N. Y. Metallic barrel	409,601	Aug. 20	2118	557	48	1103
Curtis, Charles B. (See Forcier, Joseph J., assignor.)						
Curtis & Curtis. (See Curtis, Roderick P., assignor.)						
Curtis, Henry E., Springfield, Mass., assignor to Yost Writing Machine Company. Type-writing machine	411,563	Sept. 24	2182	579	48	1715
Curtis, John, North Dorset, Vt. Steam-engine	409,563	Aug. 20	2055	542	48	1091
Curtis, Liddie, Calicoon Depot, N. Y. Adjustable rolling-pin	409,564	Aug. 20	2057	542	48	1092
Curtis, Nelson. (See Farrington and Curtis.)						
Curtis, Nelson, Boston, Mass. Steam-pressure regulator	406,029	July 2	12	5	48	5
Curtis, Roderick P., Southport, assignor to Curtis & Curtis, Bridgeport, Conn. Pipe-threading machine	406,092	July 2	99	29	48	22
Curtis, Wallace B., and W. H. Huntley, Pomeroy, assignors of one-third to C. E. Bright, Columbus, Ohio. Sheet-metal roofing, ceiling, or siding	407,772	July 30	2023	600	48	544
Cutbirth, William H., and J. Summers, Hollandsburg, Ind. Welding compound	406,887	July 16	1304	.....	48	271
Cutbirth, William H., and J. Summers, Hollandsburg, Ind. Whiffletree-hook	409,174	Aug. 20	1498	397	48	982
Cutler, Henry H., Newton, Mass. Circuit for electric railways	407,470	July 23	2200	587	48	453
D'Amour, Edward. (See Milliken and D'Amour.)						
D'Unger, Robert D., Chicago, Ill. Telephone receiving-instrument	409,736	Aug. 27	2333	613	48	1148
Dacey, Cornelius P., assignor of one-half to E. L. Firnkoess, Cincinnati, Ohio. Poultice or sponge holder for horses' feet	409,633	Aug. 20	2170	571	48	1112
Daft, Leo, Plainfield, N. J. Tubular conductor for electric railways	410,498	Sept. 3	559	150, 151	48	1378
Daggett, John F., Elgin, Ill. Wire-stitching machine	409,830	Aug. 27	2479	648, 649	48	1174
Dahl, Olof, Brooklyn, N. Y. Generating electricity by gas-batteries	411,426	Sept. 24	1962	521	48	1670
Dain, Albert E., Pittsburg, Pa. Portable forge	411,760	Sept. 24	2443	647	48	1769
Daintree, Robert H., New York, N. Y. Dental jaw-prop	410,665	Sept. 10	812	218	48	1433
Dale, Charles J. (See Dale, Henry J., assignor.)						
Dale, Henry J., Lake View, assignor of one-half to C. J. Dale, Chicago, Ill. Cuff-holder	410,750	Sept. 10	959	256	48	1459
Daley Manufacturing Company. (See Daley, Michael, assignor.)						
Daley, Michael, assignor to Daley Manufacturing Company, De Kalb, Ill. Disk harrow	411,376	Sept. 17	1880	500	48	1650
Dalrymple, George, Fair Haven, Vt. Machine for sawing stone	408,293	Aug. 6	133	33, 34	48	705
Dalrymple, James W., Solsberry, Ind. Photographic washing apparatus	406,269	July 2	336	92	48	68
Daly, William, New York, N. Y. Fuel-cartridge	408,220	Aug. 6	27	6	48	663
Damm, Fredrick C., Cleveland, Ohio. Machine for molding plastic materials	406,707	July 9	1027	275, 276	48	207
Dampierre, Bazile Z., Cleveland, Ohio. Dough-raising tray	411,279	Sept. 17	1743	495	48	1626
Danals, Cyrus A., Zanesville, Ohio. Automatic pole-changer	411,238	Sept. 17	1681	450	48	1614
Dane, Joseph W. (See Haskell, Luther D., Jr., assignor.)						
Daniels, Fred H., Worcester, Mass. Wire-drawing machine	406,030	July 2	14	5	48	5
Daniels, Fred H., Worcester, Mass. Wire-rod-rolling mill	407,176	July 16	1735	453, 454	48	355
Daniels, Fred H., Worcester, Mass. Rolling-mill plant	407,177	July 16	1737	454, 455	48	355
Daniels, Henry A., Yonkers, N. Y. Automatic air-compressor for pumps	410,075	Aug. 27	2033	544	48	1242
Daniels, William H., Southampton, England. Propeller-wheel	406,708	July 9	1030	276	48	208
Darby, Daniel H., and G. R. Chittenden, Mendon, Ill. Clasp for ribbon-rolls	406,517	July 9	743	200	48	155
Darby, John H., Brymbo, county of Denbigh, assignor to P. C. Gilchrist, London, England. Recarbonizing steel	406,430	July 9	584	165	48	126
Darling, Brown & Sharpe. (See Dow, Charles E. W., assignor.)						
Darling, Henry M., assignor to A. S. Davis, Seneca Falls, N. Y. Feeding mechanism for lathes	409,456	Aug. 20	1908	505, 506	48	1063
Darling, Samuel, Providence, R. I. Fire-pot for hot-air furnaces	410,880	Sept. 10	1147	300	48	1498
Darracq, Pierre A., Le Pré St. Gervais, France. Sewing-machine	406,431	July 9	585	165, 166	48	126
Dashiell, Charles C., Washington, D. C. Conduit for electrical wires	411,427	Sept. 24	1963	522	48	1671
Dauchy Iron Works. (See Ross, Christian H., assignor.)						
Davenport, Samuel A. (See Sturgeon, John C., assignor.)						
Davenport, Serena H., St. Paul, Minn. Trunk tray and cover	407,178	July 16	1740	455	48	356

Duplex Shoe Trimmer Company. (See Trask, Charles H., assignor.)						
Durfee, Bradford K., *et al.* (See Hartley, Charles J., assignor.)						
Durkin, James F., Scottdale, Pa. Automatic car-brake	411,547	Sept. 24	2131	564	48	1704
Durkin, Michael T., Brooklyn, N. Y. Metal-forming machine	407,516	July 23	2256	583	48	465
Durward, John M., assignor to Bristol Clock Case Company, Bristol, Conn. Clock-case	410,825	Sept. 10	1072	288	48	1484
Dutcher, John A., *et al.* (See Zimmerling, August F., assignor.)						
Dutcher, Pierrepont E., *et al.* (See Zimmerling, August F., assignor.)						
Dutton, George E., Medford, assignor of one-half to J. Burrill, Boston, Mass. Case-hook	408,380	Aug. 6	261	65	48	730
Dwelley, Lucius H., Foxcroft, Me. Combined hay raking and loading device	408,799	Aug. 13	919	245	48	863
Dwight, George S., deceased; M. T. Dwight, Montclair, N. J., administratrix. Apparatus for the manufacture of fuel-gas	406,637	July 9	928	{250 251	48	190
Dwight, Mary T., administratrix. (See Dwight, George S.)						
Dyer, Isaac T., assignor to himself and P. Fish, Chicago, Ill. Apparatus for heating cars	409,278	Aug. 20	1651	436	48	1012
Dyer, Isaac T., assignor to himself and P. Fish, Chicago, Ill. Apparatus for elevating water	409,279	Aug. 20	1652	436	48	1012
Eames, Charles J., New York, N. Y. Reducing-stack	407,000	July 16	1473	394	48	303
Eames, Elisha D., Watertown, N. Y. Automatic brake-adjuster	410,979	Aug. 27	2837	715	48	1243
Eames, Elisha D., Watertown, assignor of one-half to W. A. Foster, Corning, N. Y. Automatic brake-adjuster	410,909	Sept. 10	1250	339	48	1521
Eames, Gardner T., Racine, Wis. Wooden-rim split pulley	411,651	Sept. 24	2288	608	48	1737
Earle, Harry L., assignor to Earle Manufacturing Company, Minneapolis, Minn. Band-cutter and feeder	409,461	Aug. 20	1916	{507 508	48	1065
Earle Manufacturing Company. (See Earle, Harry L., assignor.)						
Earley, William, Philadelphia, Pa. Portable heater	408,469	Aug. 6	400	105	48	758
Earnshaw, Ellis, assignor of one-half to G. W. Fisher, Grafton, Mass. Shuttle-binder for looms	408,470	Aug. 6	401	105	48	758
Easley, John L., New York, N. Y. Lemon-juice extractor	410,789	Sept. 10	1026	276	48	1474
Eastern Electrical Manufacturing Company. (See Gould, Claude C., assignor.)						
Eastman, David, assignor of one-half to F. Sweeney, Detroit, Mich. Device for stretching and drying lace curtains	410,790	Sept. 10	1027	276	48	1474
Eastman Dry Plate and Film Company. (See Eastman, George, assignor.)						
Eastman, George, Rochester, N. Y. Roll-holder indicator	407,306	July 23	2082	538	48	430
Eastman, George, assignor to Eastman Dry Plate and Film Company, Rochester, N. Y. Photographic roll-holder	407,647	July 23	2447	631	48	503
Eastman, George, assignor to Eastman Dry Plate and Film Company, Rochester, N. Y. Camera	408,596	Aug. 6	599	{155 156	48	794
Eastman, Richard S., Manchester, N. H., assignor of one-half to A. W. Glines, Boston, Mass. Automatic railway-switch	410,961	Sept. 10	1261	340	48	1521
Eastman, William H., Concord, N. H. Mechanical telephone	411,767	Sept. 24	2452	650	48	1771
Easton, Daniel, Grafton, Nebr. Sash-holder	411,330	Sept. 17	1813	485	48	1637
Eastwick, Edward P., Jr., New York, assignor to E. C. Clark, Saratoga, N. Y. Car-coupling	407,821	July 30	2706	702	48	559
Eaton, Ambrose C. (See Eaton, David H. and A. C.)						
Eaton, David H. and A. C., Waverly, N. Y. Shipping-can for perishable articles	411,096	Sept. 17	1477	391	48	1572
Eaton, William S., Sag Harbor, assignor to Fahys Watch Case Company, New York, N. Y. Engraving-machine	409,026	Aug. 13	1263	333	48	930
Eberhardt, Henry, Chicago, Ill., assignor to Gilbert & Bennett Manufacturing Company, Georgetown, Conn. Gate-hinge	406,412	July 2	551	154	48	110
Eberhardt, Henry E. (See Eberhardt, Ulrich and H. E.)						
Eberhardt, Ulrich, Newark, N. J. Tapping attachment for drilling-machines	408,698	Aug. 13	770	{202 203	48	833
Eberhardt, Ulrich, Newark, N. J. Dirt-guard for shaping-machines	409,941	Aug. 27	2630	690	48	1205
Eberhardt, Ulrich and H. E., Newark, N. J. Drilling-machine	407,339	July 23	1989	517	48	413
Ebert, John S., Brooklyn, N. Y. Mechanism for operating hoists	409,737	Aug. 27	2333	614	48	1148
Ebert, Lorens. (See Hoffmann and Ebert.)						
Eck, James L., Kutztown, Pa. Circular-knitting machine	410,505	Sept. 3	569	{153 154	48	1360
Eckenroth, George. (See Rullmann and Eckenroth.)						
Eckstrom, Andrew M. (See Seibert and Eckstrom.)						
Eddy, Willard, Haddam, Conn. Electric signaling apparatus	408,224	Aug. 6	31	7	48	684
Edgar, Dennis P., Jackson, Mich. Car-coupling	410,544	Sept. 3	617	166	48	1390
Edgar, Ellis F., Woodbridge, N. J. Apparatus for burning hydrocarbon oils	410,826	Sept. 10	1074	288	48	1485
Edgar, Ellis F., Woodbridge, N. J. Apparatus for vaporizing and burning hydrocarbon oils	410,827	Sept. 10	1075	289	48	1485
Edgerton, Nathan H, Philadelphia, Pa. Steam-engine	409,672	Aug. 27	2238	{588 589	48	1130
Edison Electric Light Company. (See Edison, Thomas A., assignor.)						
Edison, Thomas A., Llewellyn Park, N. J. Manufacture of incandescent electric lamps	406,130	July 2	150	44	48	32
Edison, Thomas A., Llewellyn Park, N. J. Phonograph	406,568	July 9	814	220	48	169
Edison, Thomas A., Llewellyn Park, N. J. Phonogram-blank	406,569	July 9	815	220	48	169
Edison, Thomas A., Llewellyn Park, N. J. Phonograph	406,570	July 9	815	221	48	169
Edison, Thomas A., Llewellyn Park, N. J. Treating phonogram-blanks	406,571	July 9	816	221	48	169
Edison, Thomas A., Llewellyn Park, N. J. Automatic determining device for phonographs	406,572	July 9	817	222	48	169
Edison, Thomas A., Llewellyn Park, N. J. Automatic determining device for phonographs	406,573	July 9	819	222	48	170
Edison, Thomas A., Llewellyn Park, N. J. Automatic determining device for phonographs	406,574	July 9	821	222	48	170
Edison, Thomas A., Llewellyn Park, N. J. Automatic determining device for phonographs	406,575	July 9	822	223	48	170

Alphabetical list of patentees, July to September, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drgs.	Official Gazette. Vol.	Official Gazette. Page.
Edison, Thomas A., Llewellyn Park, N. J. Phonogram-blank	406,576	July 9	824	223	48	170
Edison, Thomas A., Llewellyn Park, N. J. Manufacture of incandescent electric lamps	411,018	Sept. 17	1346	362	48	1548
Edison, Thomas A., Llewellyn Park, N. J. Manufacture of incandescent electric lamps	411,019	Sept. 17	1347	362	48	1548
Edison, Thomas A., Llewellyn Park, N. J. Manufacture of carbon filaments	411,020	Sept. 17	1348	.....	48	1548
Edison, Thomas A., Llewellyn Park, N. J. Telephone	406,567	July 9	813	220	48	169
Edison, Thomas A., Menlo Park, N. J. Carbonizing-flask	411,017	Sept. 17	1345	362	48	1548
Edison, Thomas A., Menlo Park, N. J., assignor to Edison Electric Light Company, New York, N. Y. Electric meter	406,894	July 9	1207	321	48	243
Edison, Thomas A., Menlo Park, N. J., assignor to Edison Electric Light Company, New York, N. Y. Electric meter	406,895	July 9	1209	321	48	243
Edison, Thomas A., Menlo Park, N. J., assignor to Edison Electric Light Company, New York, N. Y. Manufacture of carbon filaments	411,016	Sept. 17	1344	362	48	1547
Edmands, Isaac P. T., trustee. (See Ethridge, Frank N., assignor.)						
Edmunds, Isaac P. T., *et al.* (See Ayer, Albert E., assignor.)						
Edson, Elijah H., Rochester, N. Y. Safety-heater for railway-cars	407,726	July 23	2549	660	48	523
Edson, William N., assignor of one-half to S. Frankenstein, Chicago, Ill. Injector oil-burner	407,065	July 16	1556	409	48	319
Edwards, Albert, Brooklyn, N. Y. Portfolio	407,284	July 16	1903	495	48	388
Edwards, Ayres M., Lewiston, Me. Teacher's dial	407,183	July 16	1747	457	48	357
Edwards, Edward P., Sterling, Ill. Foot-guard for railway-tracks	410,666	Sept. 10	813	218	48	1433
Edwards, Evan A. (See Phelps and Edwards.)						
Edwards, Joseph, Brooklyn, N. Y. Dumping-scow	408,290	Aug. 6	139	35, 36	48	706
Edwards, Joseph, Brooklyn, N. Y. Dumping-scow	409,942	Aug. 27	2039	{690 691	48	1205
Edwards, Richard J., Galena, Ill. Car-coupling	410,060	Aug. 27	2838	745	48	1243
Edwards, Thomas, Sr., Chicago, Ill. Floor-beam connection	407,066	July 16	1558	409	48	320
Effler, Philip A., *et al.* (See Horn, Ferdinand, assignor.)						
Egan, James P., New York, N. Y. Pen-holder	407,517	July 23	2257	583	48	465
Egan, Patrick J., Carleton, New Brunswick, Canada. Car-coupling	406,203	July 2	250	69	48	50
Egbert, Peter V., Genoa, N. Y. Scraper	406,093	July 2	100	20	48	22
Egelston, Edgar A., Albion, N. Y. Washing-machine	411,494	Sept. 24	2058	542	48	1688
Eggimann, August. (See Jericka and Eggimann.)						
Egley, John C. (See Frederick and Egley.)						
Ehnlich, Ernst, Berlin, Germany. Pocket-inkstand	411,021	Sept. 17	1349	363	48	1548
Ehrenwerth, Simon. (See Paul, Albert, assignor.)						
Ehret, Michael, Jr., Philadelphia, Pa. Roofing-paper roll	407,563	July 23	2360	611	48	487
Ehrlich, Johannes, Marion, Kans. Flue-cleaner	407,856	July 30	2756	716	48	569
Ehrlich, Leo. (See Tivy and Ehrlich.)						
Ehrlich, Leo, St. Louis, Mo. Letter-box	409,027	Aug. 13	1266	333	48	930
Ehrlich, Leo, assignor to American Roll Paper Company, St. Louis, Mo. Paper-cutter	407,518	July 23	2258	584	48	465
Ehrlich, Leo, assignor to American Roll Paper Company, St. Louis, Mo. Paper-cutter	407,519	July 23	2259	584	48	465
Ehrlich, Leo, assignor to American Roll Paper Company, St. Louis, Mo. Combined paper printer and cutter	408,597	Aug. 6	604	156	48	795
Ehrlich, Leo, assignor to American Roll Paper Company, St Louis, Mo. Roll-paper holder and cutter	408,598	Aug. 6	604	156	48	795
Ehrlich, Leo, assignor to American Roll Paper Company, St. Louis, Mo. Roll-paper holder and cutter	409,028	Aug. 13	1267	334	48	930
Eiche, Friedrich, Schandau, Saxony, Germany. Key-hole guard	410,506	Sept. 3	571	154	48	1380
Eichelberg, Leopold. (See Böhm and Eichelberg.)						
Eickershoff, John H., assignor to Triumph Compound Engine Company, Cincinnati, Ohio. Single-acting compound engine	407,184	July 16	1748	457	48	358
Eiseman, Max, and J. Kaiser, Chicago, Ill. Cuff-holder	409,833	Aug. 27	2485	649	48	1174
Elbert, Vincent L., Minneapolis, Minn. Apparatus for the manufacture of gas	411,022	Sept. 17	1350	363	48	1548
Elder, Joseph, Peoria, Ill. Carburetor	409,570	Aug. 20	2064	544	48	1093
Eldredge, Curtis B. (See Eldredge, John V. D., assignor.)						
Eldredge, John V. D., assignor of one-half to C. B. Eldredge, Detroit, Mich. Car-coupling	408,699	Aug. 13	774	203	48	833
Eldridge, George V., Somerville, Mass. Water-closet attachment	407,397	July 23	2084	539	48	430
Eldridge, James R., assignor to himself and R. McKinnon, Yarmouth, Nova Scotia, Canada. Whistle	407,067	July 16	1559	409	48	320
Electric Cable Construction and Maintenance Company. (See Brooks, David, Jr., assignor.)						
Electric Cutting Machine Company. (See Nevens, Frank W., assignor.) (Reissue.)						
Electric Gold and Silver Chlorination Company. (See Wiswell, Jacob C., assignor.)						
Electrical Accumulator Company. (See Faure, Camille A., assignor.)						
Electrical Accumulator Company. (See Griscom, William W., assignor.)						
Electrical Spectacle and Eye Glass Manufacturing Company. (See Smith and Martin, assignors.)						
Electrical Supply Company. (See Phalan, James H., assignor.)						
Electro-Automatic Transit Company. (See Weems, David G., assignor.)						
Electro Dynamic Company. (See Griscom, William W., assignor.)						
Elfering, John H., Chicago, Ill. Coin-operated induction-coil	409,738	Aug. 27	2335	614	48	1148
Elfers, August H., Phœnix, Aris. Ter. Water-elevator	408,406	Aug. 6	309	78, 79	48	739
Elfreth, Jacob R. (See Riess, Frederick W., assignor.)						
Elge, Alexander A. (See Mixter, Henry M., assignor.)						
Elgin National Watch Company. (See Hunter, George, assignor.) (Reissue.)						
Elkins, Ira S., New York, N. Y. Metal lathing	408,599	Aug. 6	605	156	48	795
Ellenwood, Raymond E., Cohoes, N. Y. Attachment for looping machines	406,638	July 9	933	252	48	191
Ellicott, Benjamin W., Flemington, N. J. Metal railway-tie	410,684	Sept. 10	842	226	48	1439
Elling, William H., Cleveland, Ohio. Type-writing machine	407,185	July 16	1750	{458 459	48	358
Elliot, W. G., *et al.* (See Grassler, William F., assignor.)						
Eliot, William H., Brooklyn, N. Y. Apparatus for transferring packages to moving cars	406,343	July 2	447	124	48	90
Elliott, Austin, Kansas City, Kans. Car-coupling	406,639	July 9	934	252	48	191
Elliott, Francis E., Miles, Wash. Ter. Combined tobacco and match case	409,029	Aug. 13	1268	334	48	931
Elliott, George S., Mobile, Ala. Shutter-worker	411,548	Sept. 24	2132	{564 565	48	1704
Elliott, Gilbert R., Boston, Mass. Store-service apparatus	409,098	Aug. 13	1370	{361 362	48	949
Elliott, James W., assignor of one-half to G. Witting, Columbus, Tex. Seed-cotton cleaner and distributer	410,962	Sept. 10	1262	340	48	1521
Elliott, Julius A., assignor of one-half to A. S. J. Gammon, Norfolk, Va. Back-band hook	410,061	Aug. 27	2339	745	48	1243
Elliott, Larkin V., Mooresville, Ind. Acoustic telephone	410,791	Sept. 10	1029	278	48	1475
Elliott, William E., Marion, Iowa. Button-machine	408,700	Aug. 13	775	{303 304	48	834
Elliott, William P., and A. Farrar, Chicago, Ill. Gate	406,577	July 9	825	223	48	171
Ellis, Augustin, Bedford, Ind. Cultivator	409,695	Aug. 20	2122	558	48	1163

Alphabetical list of patentees, July to September, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drgs.	Official Gazette. Vol.	Official Gazette. Page.
Ellis, David R., Chicago, Ill. Oil-filter	410,319	Sept. 3	290	75	48	1325
Ellis, Elijah P., Oak Hall, Kans. Flour-bin	406,038	July 2	25	8	48	8
Ellis, John, Jersey City, assignor of one-half to W. T. Wallis, East Orange, N. J. Folding baby-carriage	410,963	Sept. 10	1264	340 341	48	1522
Ellis, Lewis S., Eminence, Ky. Crupper	408,240	Aug. 6	203	51	48	719
Ellis, W. S., *et al.* (See Waterman, George, assignor.)						
Ellis, Washington L., assignor of one-half to M. E. and D. Pratt, Prattville, Ala. Saw-gin	410,082	Aug. 27	2840	746	48	1243
Ellis, William W., *et al.* (See Waterman, George, assignor.)						
Elsas, Julius, and H. Weissenburger, Canustadt, Würtemberg, Germany. Loom-shuttle	411,097	Sept. 17	1478	392	48	1573
Elterich, G. Otto. (See Elterich, Otto P. and G. O.)						
Elterich, Otto P. and G. O., assignors of one-third to C. Heitemeyer, Newark, N. J. Heating-stove	407,001	July 16	1474	384	48	303
Elterich, Otto P. and G. O., assignors of one-third to C. Heitemeyer, Newark, N. J. Furnace-grate	407,002	July 16	1476	385	48	304
Elterich, Otto P. and G. O., assignors of one-third to C. Heitemeyer, Newark, N. J. Mantel for stoves	407,003	July 16	1477	385	48	304
Emanuel, Max, London, England, assignor to G. Borgfeldt & Co., New York, N. Y. Money-box	409,778	Aug. 27	2399	629	48	1160
Emerson, Charles H., Yonkers, N. Y. Coasting-toboggan	406,892	July 16	1312	344 345	48	273
Emerson, Charles T., Lawrence, Mass. Faucet and faucet-bushing	408,831	Aug. 13	965	256	48	872
Emerson & Co., Charles H. (See McLaren, John R., Jr., assignor.)						
Emerson, Edward W., assignor to himself, W. W. Coe, and F. G. Reynolds, Boston, Mass. Theatrical appliance	406,271	July 2	338	93	48	68
Emerson, James C., Waterbury Centre, Vt. Cuff-holder	406,435	July 9	596	167	48	128
Emerson, James E. (See Midgley, Thomas, assignor.)						
Emerson, Talcott & Company. (See Jones, James H., assignor.)						
Emery, Henry C. W., and E. Christian, London, England. Tobacco-pipe	408,341	Aug. 6	204	52	48	719
Emmens, Stephen H., London, England. Projectile for smooth-bore guns	407,648	July 23	2450	634	48	504
Emmens, Stephen H., London, England. Gun and projectile for high explosives	409,943	Aug. 27	2634	691	48	1206
Emmens, Stephen H., London, England. Gun for throwing externally-applied projectiles	410,390	Sept. 3	299	76	48	1325
Emmert, John W., Eaton Rapids, Mich. Attachment for shears	406,039	July 2	26	8	48	8
Emmons, Charles C. (See Hine, Charles M., assignor.)						
Emmons, Freeman, *et al.* (See Radford, Case M., assignor.)						
Endres, Josef, and E. Schoellig, Long Island City, N. Y. Making ornamental glass panels	409,834	Aug. 27	2486	650	48	1175
Engel, Clement, assignor of one-half to P. Broyer, St. Paul, Minn. Lemon-squeezer	407,433	July 23	2147	554	48	442
Engels, Emil, Engelskirchen, near Cologne, Germany. Device for protecting gage-glass tubes	409,280	Aug. 20	1653	436	48	1013
Engels, William H., Farmington, Ark. Hand-car	408,225	Aug. 6	35	8	48	684
Engler, Karl, Home, Kans. Manufacture of writing-surfaces	407,649	July 23	2451	.....	48	504
Engler, Nicholas J., Ipswich, Dak. Ter. Stove	406,204	July 2	251	69	48	50
English, James G., New Haven, Conn. Carriage-pole crab	408,961	Aug. 13	1161	307	48	910
Ennes, John D., Norfolk, Va. Dental-bib clamp	410,063	Aug. 27	2842	746	48	1243
Enoch, Jacob, New York, N. Y. Vegetable-slicer	410,582	Sept. 10	678	181	48	1408
Ensign, Charles H., Temescal, and P. B. Wright, Berkeley, Cal. Packing for stuffing-boxes	408,407	Aug. 6	311	79	48	739
Ensminger, Christian, assignor, by mesne assignments, of one-half to C. S. Babcock, Albany, N. Y. Combined square, level, protractor, &c.	407,285	July 16	1905	496	48	388
Epple, Herman, Belleville, Ill. Reel or swift	410,405	Sept. 3	420	111	48	1351
Eppler, Andrew, Jr., Boston, Mass. Shoe-sewing machine	409,261	Aug. 20	1655	436 437	48	1013
Erdmann, Adolph, Hamburg, Germany. Copying-press	406,578	July 9	827	224	48	171
Erickson, Erick E., assignor of one half to W. Thayer, Boston, Mass. Insulating-coupling for pipes	408,600	Aug. 6	606	157	48	795
Ernst, Victor H., Jersey City, N. J. Secondary battery	408,002	July 30	2981	776	48	611
Eschenbach, Gus W. (See Steiner, Henry W., assignor.)						
Essig, Isaiah R., Canton, Ohio. Fence-machine	410,706	Sept. 10	873	235	48	1445
Estabrook, Sylvester B., Leicester, and J. P. Ashey, Worcester, Mass. Measuring can or canister	407,650	July 23	2452	635	48	504
Esten, George T. (See Parker and Esten.)						
Ethier, Callixte, St. Jérôme, Quebec, Canada. Bedstead	408,299	Aug. 6	140	36	48	707
Ethridge, Frank N., Lynn, assignor, by mesne assignments, to I. P. T. Edmands, trustee, Boston, Mass. Heel-trimming machine	411,121	Sept. 17	1517	404 405 406	48	1581

Gray, James R., Ayer, Mass. Automatic fire-extinguisher	408,302	Aug. 6	144	37	48	707
Gray, Philander R. and P. R., Jr., Elizabeth, N. J. Refrigerative apparatus	406,345	July 2	450	125 126	48	90
Gray, William, Hartford, Conn. Coin-controlled apparatus for telephones	408,709	Aug. 13	789	208	48	837
Gray, William D., Milwaukee, Wis., assignor to E. P. Allis & Company, of Wisconsin. Shaft-coupling	408,011	July 30	2997	781	48	613
Gray, William D., Milwaukee, Wis., assignor to E. P. Allis & Company, of Wisconsin. Friction-clutch	408,012	July 30	2998	782	48	614
Gray, William D. A., and J. D. Klepper, Limestone, Tenn. Post-hole digger	411,285	Sept. 17	1749	467	48	1027
Gray, William M., and W. M. White, Crawfordsville, Ind. Register for slat-fence looms	410,587	Sept. 10	687	184	48	1409
Greeley & Company, E. S. (See Smith, Thomas J., assignor.)						
Greeley, R. P. M. (See Peirce, Parker I., assignor.)						
Green & Co., George D. (See Nolley, David D., assignor.)						
Green, Henry C., St. Louis, Mo. Automatic fountain coffee-pot	411,656	Sept. 24	2298	610	48	1740
Green, Joseph J., Canton, Ohio. Hoist	406,579	July 9	827	224	48	171
Green, Joseph W., Jr., *et al.* (See Moore, George C., assignor.)						
Green, Nelson E., Minneapolis, Minn. Driving-head for sewer-sheathing	407,348	July 23	2003	520	48	415
Green, Sarah F., Brooklyn, N. Y. Self-adjusting cover for vessels	409,354	Aug. 20	1765	465	48	1033
Green, Sidney, Brooklyn, N. Y. Photographer's portable compartment for transferring plates	407,728	July 23	2551	661	48	524
Greene, Benjamin F., Pittsburg, Pa. Bottle-stopper	410,668	Sept. 10	816	219	48	1434
Greenhalgh, James, assignor of one-half to J. F. Mulvey, Woonsocket, R. I. Flushing-tank	409,147	Aug. 13	1448	380 381	48	965
Greening, Frederick, Uxbridge, England, assignor of two-thirds to O. R. Peck, Toronto, Canada, and T. W. T. Potts, London, England. Substitute for ivory, &c.	406,344	Aug. 6	207	.....	48	720
Greenlee, George J., Belvidere, Ill. Grain-binder	411,025	Sept. 17	1356	364 365	48	1549
Greenough, John J., Boston, Mass. Step for sleeping-car berths	410,793	Sept. 10	1035	277	48	1476
Greensfelder, Moses, Baltimore, Md. Cigar-machine	409,785	Aug. 27	2412	631	48	1162
Greenwood, Arthur. (See Halford and Metford, assignors.)						
Greer, William H. C., Sherman, Tex. Suspension-bridge	411,499	Sept. 24	2057	545	48	1689
Greg, Arthur, Eagley Mills, near Bolton, county of Lancaster, England. Self-acting sawing-machine	407,523	July 23	2264	586 587	48	466
Gregory, Albert A., assignor of one-half to A. Cook, Canton, Ohio. Axle-lubricator	409,962	Aug. 27	2660	698	48	1210
Gregory & Co., H. P. (See Cook, Frederick W., assignor.)						
Gregory, Edward G. (See Pollock, Joseph, assignor.)						
Gregory, George H., New York, N. Y. Gas-fitting	409,577	Aug. 20	2078	549	48	1096
Gresham, James, Stretford, near Manchester, county of Lancaster, England. Applying sand to rails of railways	409,578	Aug. 20	2079	549	48	1096
Greville-Williams, Rupert, assignor to Albany Coal Tar Dye and Chemical Company, Albany, N. Y. Compound orcin dye. (Reissue)	11,016	July 30	3317	.....	48	671
Greville-Williams, Rupert, assignor to Albany Coal Tar Dye and Chemical Company, Albany, N. Y. Making orcine dye	410,057	Aug. 27	2792	.....	48	1235
Greville-Williams, Rupert, assignor to Albany Coal Tar Dye and Chemical Company, Albany, N. Y. Making orcine dye	410,058	Aug. 27	2793	.....	48	1235
Grey, Elmer H. (See Seymour, William S., assignor.)						
Grey, Sylvester P., Nashville, Tenn. Circular saw	411,189	Sept. 17	1611	428	48	1499
Grice, Alexander P., *et al.* (See Lewis, George W., assignor)						
Griffen, Charles H. (See Taber, William, assignor.)						
Griffin, Edwin C., Brooklyn, assignor to Griffin Manufacturing Company, New York, N. Y. Pulverizing-mill	410,756	Sept. 10	967	260 261	48	1560
Griffin, Edwin C., Brooklyn, assignor to Griffin Manufacturing Company, New York, N. Y. Pulverizing-mill	410,757	Sept. 10	971	261	48	1461
Griffin, Edwin C., Brooklyn, assignor to Griffin Manufacturing Company, New York, N. Y. Pulverizing-mill	410,758	Sept. 10	974	262	48	1462
Griffin, James K., Brooklyn, N. Y. Pulverizing-mill	409,579	Aug. 20	2082	549 550	48	1096
Griffin Manufacturing Company. (See Griffin, Edwin C., assignor.)						
Griffin, Patrick H., Buffalo, N. Y. Car-wheel grinder	411,244	Sept. 17	1689	451 454	48	1615
Griffin, Thomas A., Chicago, Ill. Balancing apparatus for wheels, &c.	407,589	July 23	2366	613	48	488
Griffith, Humphrey G., Indianapolis, Ind. Lautern	408,614	Aug. 6	622	161	48	799
Griffith, Jacob K., Philadelphia, Pa. Tap-nozzle	411,519	Sept. 24	2067	551	48	1695
Grimes, Orlando M., New Haven, Conn. Machine for grinding and polishing rifle-barrels	406,643	July 9	938	253 254	48	192
Grimm, Paul H., assignor to Glen Cove Manufacturing Company, Glen Cove, N. Y. Obtaining cattle-food from starch refuse	406,166	July 2	199	.....	48	41
Grimmesey, Hiram F. (See McNutt and Grimmesey.)						
Grimston, George S., Greenwich, county of Kent, assignor to Lucigen Light Company, (limited,) Westminster, England. Vapor-burner	407,198	July 16	1770	464	48	362
Griscom, Samuel E., Philadelphia, Pa. Ore-separator	409,099	Aug. 13	1375	363	48	950
Griscom, William M., Berlin, Germany. Rotary engine	408,101	July 30	3128	819	48	639
Griscom, William W., Haverford College, Pa. Means for propelling vehicles by secondary batteries	406,833	July 9	1223	324 325	48	245
Griscom, William W., Haverford College, Pa. Mechanical movement	409,193	Aug. 20	1521	402	48	987
Griscom, William W., Haverford College, Pa., assignor to Electrical Accumulator Company, of New York. Secondary battery	406,439	July 9	601	160	48	129
Griscom, William W., Haverford College, assignor to Electro Dynamic Company, Philadelphia, Pa. Automatic regulation of electrical circuits	407,006	July 16	1480	389	48	304
Griscom, William W., Haverford College, assignor to Electro Dynamic Company, Philadelphia, Pa. Means for propelling vehicles by secondary batteries	408,231	Aug. 6	48	11	48	687
Griscom, William W., Haverford College, assignor to Electro Dynamic Company, Philadelphia, Pa. Means for propelling vehicles by secondary batteries	408,232	Aug. 6	51	11, 12	48	688
Griscom, William W., Haverford College, assignor to Electro Dynamic Company, Philadelphia, Pa. Vehicle-motor	408,233	Aug. 6	53	12	48	688
Grisenthwaite, Thomas. (See Sanford and Grisenthwaite.)						
Griswold, Merritt W., Ridgewood, N. J. Manufacture of window-glass	410,546	Sept. 3	619	160	48	1390
Groat, Elias. (See Patterson and Groat.)						
Grosbéty, Peter, Neoga, Ill. Lotion	411,657	Sept. 24	2300	.....	48	1740
Groshon, John A., New York, N. Y. Direct-acting steam-engine	410,411	Sept. 3	428	113 114	48	1353
Groshon, John A., New York, N. Y. Steam-engine	410,412	Sept. 3	430	114	48	1353
Gross, Milton H., Abilene, Kans. Saw-set	407,438	July 23	2155	537	48	444
Gross, Samuel E., Chicago, Ill. Seed-planting	407,822	July 30	2708	705	48	559

Alphabetical list of patentees, July to September, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Groswith, Henry, assignor of three-fourths to C. W. Kennedy and R. F. Rankin, Philadelphia, Pa. Galvanic battery	406,726	July 9	1054	281	48	213
Gruber, George C., and T. D. Wogan, Marita, Ohio. Burglar-alarm	407,654	July 23	2456	630	48	505
Grumbach, Charles, Houston, Tex. Heel attachment	407,860	July 30	2760	718	48	569
Gruesonwerk. (See Dreger, Max, assignor.)	410,688	Sept. 10	849	.....	48	1441
Guelick, Otto E. C., Detroit, Mich. Artificial stone	409,400	Aug. 20	1533	483	48	1047
Gueringer, Edward J. (See Le Beau, John M. V., assignor.)	410,092	Aug. 27	2663	751	48	1243
Gumbinner, Paul, New York, N. Y. Drapery-trimming	410,515	Sept. 3	583	157	48	1383
Gummer, Henry R., Dayton, Ohio. Burner for gas-stoves						
Gunckel, Winfield O., Terre Haute, Ind. Revolving coal-screen	406,345	Aug. 6	208	53	48	720
Gunklach & Co., A. (See Heine, Frederick, assignor.)	407,070	July 16	1561	410	48	321
Gunn, Andrew J., Valley Falls, Kans. Car-coupling	411,146	Sept. 17	1550	414	48	1527
Gunn, Robert, Buffalo, N. Y. Device for operating car-coupling pins	411,147	Sept. 17	1551	414	48	1527
Gunz, Oscar F., Rutherford, N. J. Stem winding and setting watch	411,744	Sept. 24	2422	641 642	48	1765
Gunz, Oscar F., Rutherford, N. J. Stem winding and setting watch						
Guptill, Winslow W., Boston, Mass. Check-punching machine	407,199	July 16	1771	464 465	48	362
Gurnee, Elbert M. (See Burtch and Gurnee.)	407,200	July 16	1774	465	48	363
Gustafson, Axel R., Marinette, Wis. Laundry-machine						
Guthrie, James F., Somerville, Mass. Fire-escape	406,834	July 9	1226	325	48	246
Guthrie, James F., Jr., Somerville, assignor to T. C. Ashley, Boston, and G. H. Graves, Malden, Mass. Nipple-holder	408,836	Aug. 13	971	258	48	873
Guy, Joseph, New York, N. Y. Water-closet	406,580	July 9	828	224	48	171
Guyot, Sumner H., Boston, Mass. Nasal respirator	409,322	Aug. 20	1716	451	48	1024
Guyton, Joshua S., Granger, Mo. Wire-tightener						
Gwinn, George L. (See Forsythe and Gwinn.)	411,026	Sept. 17	1359	365	48	1550
Haas, Edwin, Philadelphia, Pa. Syrup-faucet	406,346	July 2	453	126	48	91
Haas, George. (See Melchior and Haas.)	407,951	July 30	2907	757	48	597
Haas, Levi, Chester, Pa. Railway-tie	407 594	July 30	2813	732	48	580
Haas, William L., Charles City, Iowa. Gate	411,550	Sept. 24	2134	565 566	48	1705
Haberkorn, Theodore H., Fort Wayne, Ind. Valve for steam-engines						
Haberlein, Edward F., McPherson, Kans. Windmill	406,727	July 9	1055	281	48	213
Hacker, Joseph, L. W. Colby, and J. W. Helton, Waterloo, Iowa. Water-heater	408,303	Aug. 6	146	37	48	708
Hackett, Edmond. (See Allen and Hackett.)						
Hackney, Herbert, Topeka, Kans. Steam-boiler	410,413	Sept. 3	432	115	48	1354
Hackney, Herbert, Topeka, Kans., assignor to Hackney Steam Boiler Improvement Company, of Illinois. Feed-water purifier for steam-boilers						
Hackney Steam Boiler Improvement Company. (See Hackney, Herbert, assignor.)						
Hadcock, Judson F. (See Terrill, Delancy E., assignor.)	410,275	Sept. 3	213	56	48	1311
Hadfield, Reuben, assignor to Akron Iron Company, Akron, Ohio. Clutch for rods	406,042	July 2	29	9	48	6
Hadley, Horace W., Orange, Mass. Rotary shuttle-actuating mechanism for sewing-machines	410,276	Sept. 3	213	56	48	1311
Haenichen, Friedrich and O., Philadelphia, Pa., assignors to themselves and O. Seebass, New York, N. Y. Neutralizing the residual magnetism in electro-magnets	409,283	Aug. 20	1660	438	48	1014
Haenichen, Otto. (See Haenichen, Friedrich and O.)	407,349	July 23	2004	520	48	416
Hager, John H., Marietta, Mich. Device for carrying and applying postage-stamps	409,036	Aug. 13	1275	336	48	932
Hagerty, Michael H., Brooklyn, N. Y. Mold for glassware	407,479	July 23	2209	570	48	455
Hagey, Lewis W., St. Louis, Mo. Heating-stove	407,927	July 30	2868	717	48	589
Haglund, Oscar B., Nyköping, Södermannland, Sweden. Lock	411,435	Sept. 24	1974	524	48	1673
Haight, Jonathan, Pittsfield, Mass. Umbrella-tree	406,043	July 2	31	9	48	8
Haight, Levi A., Tyndall, Dak. Ter. Flour or meal safe	411,190	Sept. 17	1642	428	48	1599
Haiu, John B., Edgerton, Wis. Holdback for vehicles						
Haines, Burr A., Smithville, N. J. Combined wrench and screw-driver	411,436	Sept. 24	1975	524	48	1673
Haines, Charles J., trustee, *et al.* (See Graham, Alvaro B., assignor.)						
Haines, John H. J., Flushing, N. Y. Canning food	407,399	July 23	2067	540	48	431
Haines, John H. J., Flushing, N. Y., assignor of one-half to A. B. Fernald, Jersey City, N. J. Welding metal foil	409,323	Aug. 20	1717	451	48	1025
Hainkel, Sigel, assignor of one-half to L. Wolf, Quincy, Ill. Riding-saddle	408,970	Aug. 13	1177	311	48	913
Haldeman, Ephraim A., Chicago, Ill. Drafting-board	409,606	Aug. 20	2124	559	48	1104
Hale, Frank A. (See Duncan and Hale.)						
Hale, Henry S., Philadelphia, Pa. Folding bedstead						
Hale, William E. (See Baldwin, Cyrus W., assignor.)						
Haley, Thomas. (See McNeil, Murdock, assignor.)						
Halford, Henry S., Wistow, and W. E. Metford, Redland, Bristol, assignors of one-third to A. Greenwood, Leeds, England. Projectile	406,728	July 9	1057	281	48	213
Hall, Edward C., *et al.* (See Kinney, Robert, assignor.)	406,522	July 9	753	205	48	157
Hall, Frank C., assignor to W. C. Stevenson, Philadelphia, Pa. Grinding-mill	407,201	July 16	1775	465	48	363
Hall, Frank J., Philadelphia, Pa. Loom-shuttle	406,899	July 16	1324	347	48	274
Hall, Hiram, Jr., Spruce Head, Me. Ax-helve	410,669	Sept. 10	817	219	48	1434
Hall, John A., *et al.* (See Wanner, Martin, assignor.)						
Hall, Lester, and O. J. Barth, Kansas City, Mo. Grate-bar	406,835	July 9	1226	325	48	246
Hall, Martin E., U. S. Navy, assignor of one-half to M. C. Hall, Lowell, Mass. Valve-gear	409,284	Aug. 20	1661	438 439	48	1014
Hall, Mary C. (See Hall, Martin E., assignor.)	408,615	Aug. 6	696	161	48	800
Hall, Milan W., Brooklyn, N. Y. Steam-engine	410,414	Sept. 3	434	115	48	1354
Hall, Osborn B., Malden, Mass. Automatic fire-extinguishing apparatus	407,524	July 23	2206	567	48	467
Hall, Perry E., Sr., Ashtabula, Ohio. Plumber's adjustable bracket	409,100	Aug. 13	1377	363	48	951
Hall, Samuel, St. John, New Brunswick, Canada. Brush-holding cabinet	407,655	July 23	2457	636	48	505
Hall, Stephen T., St. Paul, Minn. Valve for steam or water	409,580	Aug. 20	2085	550	48	1097
Hall, Theodore F., assignor to J. Short, Marietta, Ohio. Drive-chain	407,590	July 23	2367	613	48	488
Hall, Thomas, and D. Young, Lawrence, Mass., said Young assignor to said Hall. Picker-staff check for looms	408,102	July 30	3129	819	48	639
Hall, William E., Butte City, Mont. Ter. Indicator and signal for elevators						
Hall, Zachary T., Philadelphia, Pa. Tray	409,148	Aug. 13	1450	381	48	966
Haller, John, assignor of one-half to W. Bertsch, Port Clinton, Ohio. Device for holding fruit-cans	407,928	July 30	2870	747	48	589
Hallock, Daniel Y., Southold, N. Y. Potato-digger	408,837	Aug. 13	973	259	48	874
Hallowell, Charles T., Philadelphia, Pa. Railway-signal	409,101	Aug. 13	1378	363	48	951
Halstead, Charles, Providence, R. I. Covering for rollers	410,300	Sept. 3	348	91	48	1337
Ham, Benjamin F., Cimarron, Kans. Windmill	410,886	Sept. 10	1165	313 314	48	1502
Haman, Fredrick H., Wapakoneta, Ohio. Churn						

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Hambay, James T., Wilkinsburg, assignor to Union Switch and Signal Company, Pittsburg, Pa. Coupling for signal-rods	406,211	July 2	259	71, 72	48	52
Hambay, James T., Wilkinsburg, assignor to Union Switch and Signal Company, Pittsburg, Pa. Switch and signal interlocking apparatus	406,212	July 2	261	72	48	52
Hambay, James T., Wilkinsburg, assignor to Union Switch and Signal Company, Pittsburg, Pa. Switch and signal apparatus	406,213	July 2	263	72, 73	48	52
Hambay, James T., Wilkinsburg, assignor to Union Switch and Signal Company, Pittsburg, Pa. Mechanism for operating signals	408,616	Aug. 6	627	102	48	800
Hambujer, Ephraim, Detroit, Mich. Slate-pencil sharpener	406,900	July 16	1324	347	48	274
Hamilton, Clarence J., assignor of one-half to C. A. Pinckney, Plymouth, Mich. Pump-rod coupling	406,276	July 2	345	94	48	70
Hamilton, Clarence J., assignor of one-half to R. L. Root, Plymouth, Mich. Air-gun	408,971	Aug. 13	1179	311	48	913
Hamilton, Cornelius J., assignor to J. H. Wilson, Philadelphia, Pa. Gas-burner	407,291	July 16	1913	498	48	389
Hamilton, James E., assignor to Hamilton Manufacturing Company, Two Rivers, Wis. Cutting-stick for paper-cutting machines	407,861	July 30	2761	718	48	569
Hamilton, James T., Council Bluffs, Iowa. Harrow	408,234	Aug. 6	55	12	48	699
Hamilton, John J., St. Louis, Mo. Parallel-ruler	407,350	July 23	2005	521	48	416
Hamilton Manufacturing Company. (See Hamilton, James E., assignor.)						
Hamilton, Silas H., New York, N. Y., assignor to Niagara Hydraulic Electric Company, Alexandria, Va. Apparatus for utilizing the force of water-falls	407,007	July 16	1481	386 / 387	48	305
Hamilton, Tobias. (See Achor and Hamilton.)						
Hamilton, Walter S., *et al.* (See Wray, Robert, assignor.)						
Hamlin, Arthur D., assignor of one-half to D. A. Meaher, Portland, Me. Hoof-pad	410,093	Aug. 27	2864	751	48	1248
Hamlin, Arthur D., assignor to D. A. Meaher, Portland, Me. Hoof-pad	411,745	Sept. 24	2424	642	48	1766
Hamlin, George B., Providence, R. I. Buckboard-vehicle	410,094	Aug. 27	2866	751	48	1248
Hammann, Edward, Brooklyn, assignor to J. L. Mott Iron Works, New York, N. Y. Water-closet	411,520	Sept. 24	2090	551	48	1696
Hammelmann, Charles, Buffalo, N. Y. Portable forge	410,161	Sept. 3	37	10	48	1276
Hammerly, Anton, *et al.* (See Swanger, David, assignor.) (Reissue.)						
Hammerslough, Louis. (See Wolf, Julius J., assignor.)						
Hammesfahr, Ernst, Solingen, Prussia, Germany. Drop-hammer	409,836	Aug. 27	2487	650	48	1175
Hammond, Henry, New Haven, Conn. Manufacture of axes	407,501	July 23	2368	614	48	489
Hammond, Henry, New Haven, Conn. Wrench	410,240	Sept. 3	156	41	48	1299
Hampton, Robert I., Athens, Ga. Coupling for the steam-pipes of railway-cars	406,397	July 2	533	149	48	106

Kloeppinger, George F. C., Toledo, Ohio. Device for steaming food for stock	411,595	Sept. 24	2097	553	48	1697
Klotz, Joseph, and F. Kuschel, Pittston, Pa. Carriage-pole coupling	407,017	July 16	1491	389	48	307
Knapp, Augustus S., *et al.* (See Albert, Aaron B., assignor.)						
Knapp, William H., Galesburg, Mich. Grain-carrier	410,526	Sept. 3	597	160	48	1385
Knapp, William H., Galesburg, Mich. Elevator for harvesters	410,527	Sept. 3	597	160	48	1386
Knapp, William H., Galesburg, Mich. Elevator for harvesters	411,151	Sept. 17	1558	415	48	1589
Kneeland, Joseph C., Northampton, Mass. Paper-folding machine	407,465	July 23	2097	542	48	433
Kneen, William, Barrow-in-Furness, county of Lancaster, England. Latch						
Knickerbocker Company. (See Holt, Noah W., assignor.)						
Knickerbocker Company. (See Morse, Orville M., assignor.)						
Knickerbocker, Millis, Lawtey, Fla. Refrigerator	411,665	Sept. 24	2310	613	48	1742
Knight, Edgar, Saybrook, Conn., assignor to Stoddard Lock and Manufacturing Company, New York, N. Y. Hasp-lock	411,382	Sept. 17	1690	505	48	1632
Knight, Edwin L., Springfield, Mass. Water-closet valve. (Reissue)	11,029	Sept. 3	659	175	48	1396
Knight, Henry, Ryde, Isle of Wight, England. Coin-freed weighing-machine	407,483	July 23	2214	571, 572	48	456
Knight, Henry W., Columbus, Ohio. Rain-water cut-off	410,597	Sept. 10	696	187	48	1412
Knight, Octavius, administrator. (See Buchholz, Gustav A.)						
Knight, Walter H., New York, N. Y. Electric railway	406,743	July 9	1076	287	48	217
Knight, Walter H., New York, N. Y. Electric track-sweeper	406,917	July 16	1349	354	48	280
Knight, Walter H., New York, N. Y. Electric track-sweeper	410,364	Sept. 3	355	94	48	1339
Knight, Walter N., assignor of one-half to W. H. Smith, Boardman, Fla. Railway-switch	410,103	Aug. 27	2690	750	48	1253
Knisley, James P., Adrian, Mo. Washing-machine	410,902	Sept. 10	1183	319	48	1505
Knoble, John, Wilmot, Ohio. Washing-machine						
Knode, Oliver T. (See Clark, Alvin R., assignor.)						
Knode, Zachariah U. (See Young and Knode.)						
Knoll, Jonas L., Lebanon, Pa. Washing-machine	406,918	July 16	1350	354	48	280
Knorpp, Phillip, and G. A. Mayer, Stapleton, N. Y. Machine for making confectionery	407,935	July 30	2877	749	48	591
Knothe, Adolph C., *et al.* (See Mann, Charles A., assignor.)						
Knothe, Frank, *et al.* (See Mann, Charles A., assignor.)						
Knouff, James, and S. Pope, assignors of one-third to T. Beatty, Philadelphia, Pa. Heel-burnishing machine	410,838	Sept. 10	1069	292	48	1487
Knowles, Edward R., Brooklyn, N. Y. Electrical indicator	408,018	July 30	3007	784	48	616
Knowles, Edward R., Brooklyn, N. Y. Electrical indicator	409,207	Aug. 20	1543	408	48	991
Knowles, Edward R., Brooklyn, N. Y., assignor, by mesne assignments, to Mutual Electric Manufacturing Company, of New York. Electric meter	408,016	July 30	3004	783	48	615
Knowles, Edward R., Brooklyn, N. Y., assignor, by mesne assignments, to Mutual Electric Manufacturing Company, of New York. Electric meter	408,017	July 30	3006	784	48	615
Knowles, Edward R., Brooklyn, N. Y., assignor, by mesne assignments, to Mutual Electric Manufacturing Company, of New York. Alloy for secondary-battery plates	408,182	July 30	3070	854	48	663
Knowles, Hugh A., administrator. (See Knowles, Lewis G.)						
Knowles, John H., and J. K. Proctor, assignors to Philadelphia Textile Machine Company, Philadelphia, Pa. Drying-machine	410,110	Aug. 27	2692	759	48	1253
Knowles, Lewis G., deceased, New York, N. Y.; H. A. Knowles administrator. Vertically-swinging gate	411,505	Sept. 24	2068	547	48	1692
Knowles Loom Works. (See Hutchins, George F., assignor.)						
Knowles Loom Works. (See Loyd, Richard B., assignor.)						
Knowlton, Charles H., and B. F. Meyer, assignors to M. A. Furbish & Son Machine Company, Camden, N. J. Loom	407,597	July 23	2376	615, 616	48	490
Knox, Andrew, Pewamo, Mich. Tire-tightener	407,828	July 30	2713	704	48	560
Knox, Harvey, Rixford, Pa. Sucker-rod elevator	408,415	Aug. 6	324	83	48	741
Knox, Washington L., Terrell, Tex. Stalk cutter and mower	409,979	Aug. 27	2661	703	48	1214
Knüpfer, August, Dorndorf, near Dornburg, Germany. Drill-machine	410,692	Sept. 10	854	229, 230	48	1441
Knuth, Julius F. (See Smith, Knuth, Thompson, and Ewald.)						
Koehler, Albert, Freeport, Ill. Wagon-tongue attaching device	406,515	July 9	739	202	48	155
Koehler, Frank G., St. Louis, Mo. Tuyere-iron	410,903	Sept. 10	1184	319	48	1505
Koepke, William. (See Carter and Koepke.)						
Koerner, Alfred C., Paris, France, assignor, by mesne assignments, to Hotchkiss Ordnance Company, (limited,) London, England. Operating ordnance	407,018	July 16	1492	390	48	307
Koerner, Alfred C., Paris, France, assignor to Hotchkiss Ordnance Company, (limited,) London, England. Training mechanism for ordnance	408,882	Aug. 13	1046	276, 277	48	868
Koffler, Friedrich W., Unter St. Veit, near Vienna, assignor of one-half to A. Breden, Vienna, Austria-Hungary. Apparatus for coating metals with zinc or other metals	407,222	July 16	1509	473, 474	48	309
Köhler, Franz S., Smichow, near Prague, Austria-Hungary, assignor of one-half to L. Keyling, Berlin, Germany. Apparatus for producing shot	406,353	July 2	463	129, 130	48	93
Kohn, Herman, San Francisco, Cal. Double-acting bellows	409,960	Aug. 27	2662	703	48	1215
Kohnen & Co. (See Brab, August, assignor.)						
Kohns, Lazarus, New York, N. Y. Cup for receiving condensed milk or marmalade packages	406,841	July 9	1234	327	48	247

Alphabetical list of patentees, July to September, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drgs.	Official Gazette. Vol.	Official Gazette. Page.

Kolb, Louis. (See Norwood, George, assignor.)						
Kolle, Harold W., London, county of Surrey, England. Electric meter	411,042	Sept. 17	1382	370, 371	48	1545
Konrad, Nicholas. (See Peirce, Andrew J., assignor.)						
Kookogey Electric Company. (See Kookogey, William P., assignor.)						
Kookogey, William P., Brooklyn, N. Y. Means for measuring and regulating the charge and discharge of secondary batteries	408,112	July 30	3155	825	48	643
Kookogey, William P., Brooklyn, N. Y., assignor to Kookogey Electric Company. System for charging and discharging storage-batteries	406,354	July 2	464	130	48	93
Kookogey William P., Brooklyn, N. Y., assignor to Kookogey Electric Company. Shipping-case	407,957	July 30	2914	750	48	509
Kookogey, William P., Brooklyn, N. Y., assignor to Kookogey Electric Company. Making solution compounds for galvanic batteries	409,291	Aug. 20	1674	.....	48	1016
Kookogey, William P., Brooklyn, assignor to Kookogey Electric Company, New York, N. Y. Galvanic battery	407,781	July 30	2637	663	48	547
Kookogey, William P., Brooklyn, assignor to Kookogey Electric Company, New York, N. Y. Producing battery solutions	408,629	Aug. 6	647	.....	48	804
Kookogey, William P., Brooklyn, assignor to Kookogey Electric Company, New York, N. Y. Electrode for secondary batteries	409,106	Aug. 13	1383	363	48	952
Kookogey, William P., Brooklyn, assignor to Kookogey Electric Company, New York, N. Y. Apparatus for charging secondary batteries	410,111	Aug. 27	2694	700	48	1254
Koopman, Bearard W., Terre Haute, Ind. Last	410,528	Sept. 3	599	166	48	1386
Kopp, Henry S. (See Dixon and Kopp.)						
Kornblum, Joseph, J. A. Brashear, and P. Painter, Allegheny, Pa. Astigmatic eye-piece for optical instruments	408,725	Aug. 13	810	215	48	840
Köthner, Paul, Berlin, Germany. Atomizer	406,268	July 2	360	98	48	73
Koyl, Charles H., Philadelphia, Pa. Semaphore-signal for railways	410,509	Sept. 10	701	187	48	1411
Koyl, Charles H., Philadelphia, assignor to National Switch and Signal Company, Bethlehem, Pa. Semaphore-signal for railways	410,508	Sept. 10	699	187	48	1411
Kraetzer, Edwin J., Gloversville, N. Y., assignor to International Fastening Company, Portland, Me. Glove-fastener	407,295	July 16	1917	490	48	390
Kranich, Hellmuth, and J. Bach, New York, N. Y. Piano-action	411,246	Sept. 17	1605	453	48	1617
Kranwenkal, Ferdenand, and W. Kelley, Aurora, Ill. Railway-car heater	408,113	July 30	3158	825	48	643
Kranz, Fredrich, Sandusky, Ohio. Limekiln	407,406	July 23	2098	548	48	431
Kratz, Peter A. (See Lindenmayer, Jacob, assignor.)						
Krauser, John L., Leeper, Pa. Bucket or tub	407,019	July 16	1494	390	48	307
Krausse, Carl R., administrator. (See Krausse, Karl L.)						
Krausse, Karl L., deceased; C. R. Krausse, Philadelphia, Pa., administrator and assignor to Decker Machine Company, of Pennsylvania. Card-cylinder	411,105	Sept. 17	1483	394	48	1575
Krebs, George L. (See Solter, John, assignor.)						
Krekel, Henry G. (See Bauer, Robert A., assignor.)						
Kremmler, Richard. (See Schubert, Carl, assignor.)						
Krengel, Ernst E. (See Washburn and Krengel.)						
Krick, Irwin S., Conneautville, Pa. Device for catching animals	408,309	Aug. 6	158	39	48	709
Krick, William C., Brooklyn, N. Y. Floral letter or design	408,416	Aug. 6	325	83	48	742
Kriete, Henry W., assignor to L. F. Kriete, Charleston, S. C. Washing-machine	410,980	Sept. 10	1295	350	48	1523
Kriete, Laura F. (See Kriete, Henry W., assignor.)						
Kriner, Jeremiah, Carlisle Springs, Pa. Fruit-gatherer	406,744	July 9	1081	287	48	219
Krogmann, Charles H. E., Cincinnati, Ohio. Photographic lens	409,981	Aug. 27	2683	704	48	1215
Kron, Charles A., New York, N. Y. Holder for finger-rings	407,668	July 23	2473	640	48	508
Kroncke, Peter H., Santa Rosa, Cal. Counter-shaft and belt-tightener	408,417	Aug. 6	325	84	48	742
Krug & Son, G. (See Krug, Theodore F., assignor.)						
Krug, Theodore F., assignor to G. Krug & Son, Baltimore, Md. Machine for bending metal bars	410,112	Aug. 27	2697	700	48	1254
Krumbein, Charles J., Chicago, Ill. Artist's field and material case	409,982	Aug. 27	2683	704	48	1215
Kruse, Charles C. (See Boefer and Kruse.)						
Krutsch, Willis W., assignor of one-half to S. Van Buskirk, Fort Scott, Kans. Wood embossing, filling, and backing out machine	407,223	July 16	1813	473, 475	48	370
Kuehne, Oscar R., Topeka, Kans. Ventilator smoke-stack	410,113	Aug. 27	2698	703	48	1254
Kuess, Victor J., assignor to F. Bapterosses & Company, Paris, France. Ornamenting china, porcelain, &c	406,745	July 9	1083	288	48	219
Kugler, Ephraim R., Kingwood, N. J. Hay-binder	409,983	Aug. 27	2685	704	48	1215
Kuhl, Charles, Cincinnati, Ohio. Flagstone and cement pavement	406,289	July 2	361	99	48	73
Kuhn, David C., Albany, N. Y. Pin for hinges of stove-doors	411,152	Sept. 17	1562	415	48	1589
Kuhn, Williams, Clermont-Ferrand, France. Apparatus for the pasteurization of beer	410,287	Sept. 3	227	59, 60	48	1314
Kunkle, Allen A. (See Kunkle, Kenton C. and A. A.)						
Kunkle, Kenton C. and A. A., Lebanon, Ohio; said A. A. Kunkle assignor to said Kenton C. Kunkle. Knotting device for grain-binders	407,734	July 23	2559	662, 663	48	525
Künzler, Conrad, Toledo, Ohio. Car-coupling	407,020	July 16	1495	391	48	308
Kürbitz, Gustav. (See Kaselowski, Gramm, and Kürbitz.						
Kürsten, Paul E. (See Illgen, Paul C., assignor.)						
Kurtz, Harry H., assignor of one-half to J. H. Bair, Salisbury, Pa. Nut-lock	406,842	July 9	1235	317	48	247
Kuschel, Ferdinand. (See Klotz and Kuschel.)						
Kntsche, Oswald, Chicago, Ill., assignor to Chicago Exhaust and Blow Pipe Company, of Illinois. Dust-collector	407,598	July 23	2378	616	48	490
Kynoch, George, and H. A. Schlund, Birmingham, county of Warwick, England. Manufacturing projectiles	407,536	July 23	2290	591	48	470
L'Esperance, Raoul T., *et al.* (See Virnoche, Maxime, assignor.)						
La Casse, Henry, Syracuse, and S. Wile, Rochester, N. Y.; said La Casse assignor to said Wile. Machine for corking bottles and wiring the corks thereto	406,450	July 9	617	173, 174, 175, 176	48	133
La Dow Charles, Albany, N. Y. Harrow	411,199	Sept. 17	1627	433, 434	48	1603
La Roe, Albert E., Cincinnati, Ohio. Paper-perforating machine	410,643	Sept. 10	776	210	48	1427
La Rue, Henry. (See Aymond and La Rue.)						
Laasa, Emil, *et al.* (See Dewey, Mark W., assignor.)						
Lacavalerie, Sébastien, and C. Doriot, assignors to S. S. White Dental Manufacturing Company, Philadelphia, Pa. Dental plugger	408,8-3	Aug. 13	1048	277	48	888
Lackawanna Mills. (See Bean, Charles E., assignor.)						
Laconia Car Company. (See Sargent, Arthur G., assignor.)						
Lacroix, Charles. (See Ostermann and Lacroix.)						
Lacroix, Léonide, Fils, Masères sur Salat, France. Machinery for cutting and winding stripe of paper for cigarettes or other purposes	409,408	Aug. 20	1840	485, 486	48	1049

Alphabetical list of patentees, July to September, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drgs.	Official Gazette. Vol.	Official Gazette. Page.
Lacy, Benjamin T. (See Behr, Hans C., assignor.)						
Ladd, Calvin P., Cambridge, Mass., and W. Muir, New York, N. Y., assignors, by mesne assignments, to National Loom Harness Company, of Maine. Heddle-frame for looms	407,078	July 16	1572	413	48	323
Ladd, Lafayette, Adrian, Mich. Machine for separating seed from pulp	408,243	Aug. 6	65	15	48	692
Ladd, Leonard E. (See Jesson and Weed, assignors.)						
Lafferty, John. (See Garcia, Leon P., assignor.)						
Lafferty, Samuel C., assignor to Western Electric Company, Chicago, Ill. Terminal plug attachment for flexible electric cords	411,153	Sept. 17	1563	416	48	1589
Laflin, Louis E. (See King, Molesworth, assignor.)						
Laidlaw, John, Glasgow, counties of Lanark and Renfrew, Scotland. Gearing for driving centrifugal machines	409,984	Aug. 27	2685	704, 705	48	1215
Laidlaw, William A., Cherokee, Kans. Wire-bale-tie machine	406,114	July 30	3159	826	48	644
Laidlaw, William A., Cherokee, Kans. Baling-press	406,115	July 30	3163	826, 827	48	644
Lairesse, Edouard, San Francisco, Cal. Safety device for elevators	406,843	July 9	1236	327	48	247
Lake Shore Manufacturing Company. (See Becker, Albert C., assignor.)						
Lakiu, Thomas W., administrator. (See Snowden, Charles S.)	410,365	Sept. 3	335	94, 95	48	1339
Lamar, James S., Valdosta, Ga. Hand-propeller for boats	410,520	Sept. 10	1092	292	48	1488
Lamb, Elijah, Camden, N. J. Elastic webbing	406,051	July 2	42	12	48	11
Lamb, William, Downey, Cal. Cooking-stove	406,355	July 2	466	130	48	94
Lamberton, Andrew, Coatbridge, county of Lanark, Scotland. Grinding-mill						
Lambinet, Edouard, Marseilles, France, assignor to J. G. Alison & Co., Birkenhead, England. Indicator of motion and speed of steam and like motors	406,222	July 2	272	75, 76	48	54
Lamson Consolidated Store Service Company. (See Goodfellow, John H., assignor.)						
Lamson, Warren H., Bridgeport, Conn. Pencil-sharpener	411,526	Sept. 24	2098	553	48	1697
Landis, Abraham B., Waynesborough, Pa. Screw-cutting head	409,806	Aug. 20	1544	408	48	991
Landis, Israel L., Lancaster, Pa. Pavement-curb	409,469	Aug. 20	1528	392	48	1067
Landmann, Gustavus, Hartford, Conn. Machine for making screws	407,537	July 22	2282	592, 593	48	470
Landon, Marcus O. (See Johnson, William H., assignor.)						
Lane, Edward. (See Agee and Lane.)	411,453	Sept. 24	1998	530	48	1677
Lane, John, Massillon, Ohio. Stop-action for reed-organs	407,357	July 23	2028	525	48	419
Lane, John G., Poughkeepsie, N. Y. Door-hanger track						
Lane, John H. (See Pratt and Lane.)						
Lane, Nathan C. (See Tebbs, Lane, and Coombe.)						
Lang, Fred N., assignor to National Automatic Device Company, Minneapolis, Minn. Automatic race-course	410,961	Sept. 10	1297	350	48	1529
Lang, Frederick C., Hoboken, N. J. Steam-steering apparatus	409,749	Aug. 27	2350	618	48	1151
Lang, George, *et al* (See Horn, Ferdinand, assignor.)						
Lang, William F., Allegheny, assignor to Union American Cigar Company, (limited,) Pittsburg, Pa. Packing cigars	410,553	Sept. 3	630	168	48	1392
Langau, Hugh, *et al.* (See Norton, James A., assignor.)						
Langbein, George, Omaha, Nebr. Carriage-spring	409,668	Aug. 27	2263	595	48	1135
Lange, Arthur, Dresden, Saxony, Germany. Apparatus for cleaning windows	411,154	Sept. 17	1563	416	48	1589
Lange, Diego, La Crosse, Wis. Carpet binding and fastener	406,451	July 9	998	176	48	136
Lange, Frederick G., St. Acheul-les-Amiens, France. Machine for combing wool, &c	410,429	Sept. 3	444	117, 118	48	1356
Lange, Lars G., Cannon River Falls, Minn. Injector	409,046	Aug. 13	1290	340	48	934
Langenhagen, Gustav, Leipsic, Saxony, Germany. Leather-polish	406,102	July 2	113	.....	48	24
Langer, Carl. (See Mond and Langer.)						
Langer, Carl, London, England. Apparatus for treating solids with gases	409,409	Aug. 20	1842	486, 487	48	1049
Langevin, Dominick L., *et al.* (See Dumais, Jean B. Z., assignor.)						
Langlais, Alonzo, assignor of one-half to A. Ramsay & Son, Montreal, Quebec, Canada. Glass-beveling machine	408,726	Aug. 13	812	214	48	841
Lannert, John A., Cleveland, Ohio. Electric registering apparatus	406,172	July 2	208	57, 58	48	42
Lansberg Brake Company. (See Lansberg, Frank, assignor.)						
Lansberg, Frank, St. Louis, Mo., assignor to Lansberg Brake Company, East St. Louis, Ill. Brake for locomotives	406,844	July 9	1237	328	48	247
Lanum, David. (See Blume and Armstrong, assignors.)						
Lapp, John, Honeoye Falls, N. Y. Boiler	411,249	Sept. 17	1696	453, 454	48	1617
Larkin, David, assignor to himself, J. B. and F. D. Larkin, Pittsburg, Pa. Making strap or hoop iron	409,047	Aug. 13	1291	341	48	935
Larkin, David, assignor to himself, J. B. and F. D. Larkin, Pittsburg, Pa. Rolling-mill for hoop or scrap iron	409,048	Aug. 13	1293	341	48	935
Larkin, Frank D., *et al.* (See Larkin, David, assignor.)						
Larkin, John B., *et al.* (See Larkin, David, assignor.)	408,418	Aug. 6	326	84	48	742
Larkin, John F., Manchester, N. H. Self-closing stop-cock	408,488	Aug. 6	427	.....	48	763
Larkin, John F., Manchester, N. H. Remedy for corns						
Larochelle, Amelie, Hoboken, N. J. Remedy for corns						
Larrabee, C. S., trustee. (See Fischer, Benno, assignor.)						
Larrabee, Henry L., and D. Putnam, Peabody, Mass. Manufacture of wigwam shoes or slippers	411,454	Sept. 24	1999	530	48	1677
Larrabee, Philip J. (See Loring, George A., assignor.)						
Larsen, Christian F., Copenhagen, Denmark. Centrifugal machine for creaming milk	406,746	July 9	1084	288	48	220
Lash, Horace W. (See Slocum and Lash.)						
Laskey, Lewis B., Dover, N. H. Ladder platform-bracket	407,079	July 16	1574	413	48	323
Latch, Arthur. (See Batchelor and Latch.)						
Latham, Ernest. (See Carey and Latham.)						
Lathe, James E. (See Van Horn and Lathe.)						
Latimer, John W., assignor to Milwaukee Harvester Company, Milwaukee, Wis. Raising and lowering device for harvesters	407,599	July 23	2379	616	48	491
Latimer, John W., assignor to Milwaukee Harvester Company, Milwaukee, Wis. Harvester	406,244	Aug. 6	66	15	48	692
Latimer, William, Wilmington, N. C. Pine fiber	409,608	Aug. 20	2128	.....	48	1104
Latimer, William G., assignor to Universal Automatic Cashier Company, Detroit, Mich. Cash register and indicator	409,107	Aug. 13	1385	365, 366	48	952
Lattan, Louis, and H. Tripp, Chicago, Ill. Cigar-perforator	407,358	July 23	2028	525	48	419
Lattan, Louis, H. Tripp, Chicago, and J. Faulkner, Austin, Ill. Water-closet	411,455	Sept. 24	2001	531	48	1678
Lanbe, Godfried, Huron, Dak. Ter. Straw-burning cook-stove	409,909	Aug. 20	1547	409	48	991
Laudenslager, Charles. (See Swanson, Charles A., assignor.)						
Lauferty, Joseph, New York, N. Y. Suspender-buckle	407,407	July 23	2099	542	48	433
Laughlin, Homer. (See Jackson, Samuel P., assignor.)						
Laughlin, Patrick, Mount Sterling, Ky. Filter	409,210	Aug. 20	1548	409	48	992

Alphabetical list of patentees, July to September, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr's.	Official Gazette. Vol.	Official Gazette. Page
Laundry, Andrew. (See Warren, Henry H., assignor.)						
Laureau, Louis G., and F. W. Gordon, assignors to Gordon, Strobel & Laureau, (limited,) Philadelphia, Pa. Steel-furnace	407,600	July 23	2380	617	48	491
Lauria, Warren, Kalamazoo, Mich. Two-wheeled vehicle	406,919	July 16	1351	354	48	280
Lautermilch, Frederick, assignor of one-half to E. Wilmas, Kirkwood, Mo. Split chuck for watch-makers' lathes	406,356	July 2	467	131	48	94
Lavigne, Joseph P., New Haven, Conn. Making cannon	406,438	July 9	639	176	48	136
Lawitzka, Julius, Peoria, Ill. Car-brake	408,916	Aug. 13	1096	269	48	698
Lawrence, Charles F., Lithium, and M. Rueckert, St. Mary's, Mo. Grain-drill	407,359	July 23	2029	525 526	48	490
Lawrence, Georgina M., London, England. Apparatus for treating animals by electricity	409,470	Aug. 20	1929	510 511	48	1068
Lawrence, Leroy P. (See Brennan, Nicholas, assignor.)						
Lawrence, Louis P., Passaic, N. J., assignor to Lawrence Railway Brake Company, New York, N. Y. Packing for pistons	408,981	Aug. 13	1191	314	48	916
Lawrence, Louis P., Passaic, N. J., assignor to Lawrence Railway Brake Company, New York, N. Y. Car-brake	408,982	Aug. 13	1192	314	48	916
Lawrence Railway Brake Company. (See Lawrence, Louis P., assignor.)						
Lawrence, Victor V., Waterford, Vt., assignor of one-half to I. F. Paul, Boston, Mass., and A. H. Carpenter, West Waterford, Vt. Rotary planing-machine	406,587	July 9	838	226	48	173
Lawson, Daniel T., Wellsville, Ohio. Steam-boiler	407,538	July 23	2299	593	48	474
Lawson Manufacturing Company. (See Lawson, Thomas W., assignor.)						
Lawson, P. V., and W. L. Field, Menasha, Wis. Pulley	407,866	July 30	2770	720	48	571
Lawson, Thomas W., Cambridge, assignor to Lawson Manufacturing Company, Boston, Mass. Manifold sales-book	406,845	July 9	1228	328	48	248
Layman, Hiram D., Little Rock, Ark. Car-coupling	408,906	Aug. 13	929	247 248	48	865
Layng, George, Worcester, Mass. Condensing mechanism for carding-engines	409,211	Aug. 20	1549	409 410	48	992
Layng, George, assignor of one-half to S. W. Goddard, Worcester, Mass. Apparatus for reversing rotary motion	406,586	July 9	836	226	48	173
Le Beau, John M. V., assignor of one-half to E. J. Gueringer, New Orleans, La. Corset-clasp	409,410	Aug. 20	1843	487	48	1050
Leach, Frank H. (See McCulla, Frank M., assignor.)						
Leach, Henry, Bristol, assignor to P. & F. Corbin, New Britain, Conn. Door-bell	410,713	Sept. 10	894	241	48	1447
Leach, Joseph B., Roberts, Ill. Stove-pipe attachment	408,884	Aug. 13	1049	277	48	698
Leach, William, Accrington, county of Lancaster, England. Mechanical stoker	410,735	Sept. 10	935	250	48	1454
Leadbeater, Frederick, Detroit, Mich. Oil-burning apparatus for steam-boilers	409,846	Aug. 27	2502	654	48	1177
Leas, James W., Angoria, Tex. Plow	411,342	Sept. 17	1838	491	48	1642
Leavitt, John E., Boston, Mass. Waistband for trousers	411,250	Sept. 17	1698	454	48	1617
Leblanc, Alfredo, Havana, Cuba. Sugar-cane mill	408,630	Aug. 6	648	168	48	804
Lechner, Francis M., Columbus, Ohio. Mining-machine and apparatus for operating the same	411,200	Sept. 17	1630	434	48	1603
Leckron, Benjamin E., assignor of one-half to A. Castanien, Glenford, Ohio. Spring-bed	411,343	Sept. 17	1840	491	48	1643
Ledig, Ernst, Chemnitz, Saxony, Germany, assignor of one-half to B. Terne, Philadelphia, Pa. Gas-washing apparatus	407,996	July 30	2879	750	48	591
Leduc, Ambrose. (See Leduc, Frank and A.)						
Leduc, Frank and A., Detroit, Mich. Window-screen	407,669	July 23	2473	640	48	508
Lee, Charles T., *et al.* (See McCarthy, Louis, assignor.)						
Lee, Charles T., assignor of one-half to Gould & Watson Company, Boston, Mass. Composition of matter	409,985	Aug. 27	2687	.....	48	1215
Lee, Charles T., assignor of one-half to Gould & Watson Company, Boston, Mass. Attaching composition of matter to metal	409,986	Aug. 27	2687	.....	48	1216
Lee, Charles T., Boston, Mass., assignor of one-half to Gould & Watson Company, of Massachusetts. Packing for steam-pipes	411,384	Sept. 17	1891	505	48	1652
Lee Company, J. Ellwood. (See Lee, John E., assignor.)						
Lee, John, Jr., Sterling, Ohio. Washing-machine	407,484	July 23	2217	572	48	457
Lee, John E., assignor to J. E. Lee Company, Conshohocken, Pa. Galvanic battery	406,223	July 2	276	76	48	55
Lee, John M., Douglas, Ark. Cart-seat	411,597	Sept. 24	2210	588	48	1721
Leeder, Frederick G., Dalmuir, county of Dumbarton, Scotland. Sand-molding machine	409,471	Aug. 20	1931	511	48	1068
Leeds-Barratt Supply Company. (See Doane, Azadore M., assignor.)						
Leedy, Byram B., West Independence, Ohio. Corn-harvester	409,987	Aug. 27	2688	705	48	1216
Lees, James, Lucknow, Ontario, Canada, assignor to G. Draper & Sons, Hopedale, Mass. Compound spinning-spindle	410,982	Sept. 10	1299	350	48	1329
Lefevre, E. L. (See Cahoon, William, Jr., assignor.)						
Leforestier, Alexandre, Philadelphia, Pa. Bottle-stopper fastening	408,419	Aug. 6	327	84	48	742
Leggett, Jasper N. (See Leggett, John and J. N.)						
Leggett, John and J. N., Hagerstown, Md. Family or invalid bedstead	408,350	Aug. 6	214	54	48	721
Lehman, Simon S., Marticville, and C. K. Herr, West Lampeter, Pa. Car-coupling	406,103	July 2	113	33	48	24
Leibe, Hugo, Baltimore, Md. Harness-stuffing machine	408,489	Aug. 6	428	112	48	763
Leighton, Arthur M., assignor of one-half to J. H. Livermore, Port Townsend, Wash. Ter. Adjustable last	407,080	July 16	1574	413	48	323
Leighton, Arthur M., assignor of one-half to J. H. Livermore, Port Townsend, Wash. Ter. Boot or shoe last	407,081	July 16	1576	413	48	324
Leighton, Thomas R., assignor to Jarecki Manufacturing Company, (limited,) Erie, Pa. Nipple-holding chuck	409,108	Aug. 13	1389	366	48	953
Leikvold, Sander H. (See Jeglum and Leikvold.)						
Leimke, Herman H. (See Rabich, William, assignor.)						
Leinard, Edgar A., and G. W. Sheets, Karle, Ohio. Branding-chute	406,920	July 16	1351	354	48	280
Leinbach, Felix W., *et al.* (See Lorenz, William A., assignor.)						
Leinbach, Felix W., *et al.* (See Lorenz and Claussen, assignors.)						
Leinbach, Felix W., *et al.* (See Lorenz and Honiss, assignors.)						
Leith, Alexander J., *et al.* (See Barnes, David L., assignor.)						
Leland, Edwin A., New York, assignor to L. Richardson, Brooklyn, N. Y. Elastic-faced type	407,670	July 23	2474	640	48	508
Leland, Edwin A., assignor to L. Richardson, Brooklyn, N. Y. Coupling for steam-pipes for railway-car-heating apparatus	407,671	July 23	2476	641	48	508
Leland, Edwin A., assignor to L. Richardson, Brooklyn, N. Y. Brake-hose coupling	408,116	July 30	3166	827	48	645
Leland, Hiram F., Lockport, N. Y. Steam or water trap	407,324	July 16	1815	475	48	371
Lemberger, Edward, Toledo, Ohio. Attachment for writing-desks	411,456	Sept. 24	2002	531	48	1678
Lemen, Austin H., assignor of one-half to W. W. Millard, Fenton, Mich. Buckle	411,457	Sept. 24	2003	532	48	1678
Lemmon, Frank. (See Carroll and Lemmon.)						
Lemonde, Louis, *et al.* (See Virnoche, Maxime, assignor.)						
Lemp, Hermann, Lynn, Mass. Lightning-arrester	409,689	Aug. 27	2964	585	48	1135
Lemp, Hermann, Lynn, Mass., assignor to Thomson-Houston Electric Company, of Connecticut. Joint for carbon filaments	410,168	Sept. 3	45	12	48	1277
Lempert, Leon H. (See Lerman and Thomas, assignors.)						
Leng, Charles. (See Leng, Christian F. and C.)						
Leng, Christian F. and C., Pittsburg, Pa. Forming the necks of fruit-jars	411,043	Sept. 17	1383	371	48	1545
Lennier, Alexander W., Jamestown, N. Y. Fire-escape	411,106	Sept. 17	1494	396	48	1576
Lennon, Watson S., Hardinsburg, Ky. Wire-splicing tool	407,782	July 30	2038	693	48	547
Lentz, August, assignor to Lentz Iron Smelting Company, Chicago, Ill. Hydrocarbon-burner for furnaces	411,385	Sept. 17	1891	505	48	1652
Lentz Iron Smelting Company. (See Lentz, August, assignor.)						
Leonard, Charles L. (See Manning, Thomas J., assignor.)						
Leonhardt, John H. (See Leonhardt, William and J. H.)						
Leonhardt Wagon Manufacturing Company. (See Leonhardt, William and J. H., assignors.)						
Leonhardt, William and J. H., assignors to Leonhardt Wagon Manufacturing Company, Baltimore, Md. Lumber-wagon	409,411	Aug. 20	1845	487	48	1050
Leruth, Michel, assignor to himself, L. Sewell, and W. Blake, New Orleans, La. Decorticator for ramie, &c	409,647	Aug. 27	2503	654	48	1178
Leslie, Arthur M., Chicago, Ill. Sewing-machine	408,019	July 30	3008	784	48	616
Lester, George, *et al.* (See Day and Spofford, assignors.)						
Leuener, John E., Nashville, Tenn. Removable horseshoe-calk	408,983	Aug. 13	1193	315	48	916
Letot, Clement, Letot Station, Tex. Cotton and corn planter	410,904	Sept. 10	1185	320	48	1505
Leuchs, Georg, and F. Meiser, Nuremberg, Germany. Bottle or similar article	411,157	Sept. 17	1570	418	48	1591
Levarn, Daniel, New Haven, Vt. Potato-digger	409,472	Aug. 20	1932	511	48	1068
Levi, Ernst, *et al.* (See Clorer, Wilhelm, assignor.)						
Levy, Dreyfus & Co. (See Clements, Abner B., assignor.)						
Levy, Dreyfus & Co. (See Meyrowitz, Emil B., assignor.)						
Levy, Leon, Nashville, Tenn. Bottle-cooler	409,292	Aug. 20	1675	441	48	1016
Lewis, Abram W., Asbury Park, N. J. Cocoanut-parer	411,598	Sept. 24	2211	588 589	48	1721
Lewis, Douglas P., Cincinnati, Ohio. Attachment for open fire-places	410,169	Sept. 3	46	12	48	1277
Lewis, Ellsworth J., Warrenton, Ohio. Releasing attachment for automatic air-brakes	410,288	Sept. 3	230	60	48	1314
Lewis, Enoch P., Gastonia, N. C. Fertilizer-distributer	408,885	Aug. 13	1050	277 278	48	886
Lewis, Frank W., Brooklyn, N. Y. Detachable hat sweat and lining	411,155	Sept. 17	1564	416	48	1589
Lewis, G. W. (See Mellon, John S., assignor.)						
Lewis, George W., assignor of one-half to C. Brunner, La Salle, Ill. Steam-engine	408,490	Aug. 6	429	112 113	48	764
Lewis, George W., assignor of two-thirds to A. P. Grice and L. C. Godwin, Portsmouth, Va. Seal-lock	408,886	Aug. 13	1052	278	48	889
Lewis, James A., Hassall, near Sandbach, assignor to Powell Brothers & Whitaker, Wrexham, England. Potato-digger	409,293	Aug. 20	1676	441	48	1017
Lewis, John F. (See Mattes and Lewis.)						
Lewis, Robert B., assignor of two-thirds to H. V. Snead, New York, N. Y., and W. B. Fonda, Morristown, N. J. Attachment for mail-boxes	410,905	Sept. 10	1186	320	48	1506
Lewis, William, Sauk Centre, Minn. Draft-equalizer	408,727	Aug. 13	814	214	48	841
Lewis, William F., assignor to Plume & Atwood Manufacturing Company, Waterbury, Conn. Machine for forming screw-threads on articles of sheet metal	411,156	Sept. 17	1565	416 417	48	1590
Lewis, William J., Pittsburg, Pa. Rolling metal	409,049	Aug. 13	1205	343	48	935
Lewis, William J., Pittsburg, Pa. Rolled metal plate	409,050	Aug. 13	1206	342	48	935
Lewis, William W., Cheyenne, Wyo. Ter. Connecting-bar for riding-saddles	409,848	Aug. 27	2504	655	48	1178
Leyson, Sackville G., and E. Thomas, Rome, assignors of fifty-one one-hundredths to L. H. Lempert, Rochester, N. Y. Brick-machine	409,988	Aug. 27	2689	705 706	48	1216
Libbey, Hosea W., Boston, Mass. Car-wheel	406,104	July 2	115	31	48	24
Libbey, Hosea W., Boston, Mass. Car-wheel	406,105	July 2	116	34	48	25
Libbey, Hosea W., Boston, Mass. Railway-rail	411,344	Sept. 17	1841	492	48	1643
Libby, Charles L., assignor to E. P. Bullard, Bridgeport, Conn. Turret lathe	406,413	July 2	553	154 155 156	48	111
Liberty Manufacturing Company. (See Waldron and Jones, assignors.)						
Liddell, Mark J., Mount Pleasant, Mich. Pipe-damper	407,662	July 16	1577	414	48	324
Liddell, Robert, Blakeman, Kans. Roofing-tile	411,666	Sept. 24	2311	613	48	1742
Liedke, Edward L., Sandusky, Ohio. Check-punch	407,867	July 30	2772	720	48	571
Liedl, Joseph, Fergus Falls, Minn. Radiator	408,420	Aug. 6	328	84	48	742
Lighthall, John A., Syracuse, N. Y. Fertilizer	408,491	Aug. 6	431	113	48	764
Lighthipe, James A., Wilmington, Del., assignor to himself, G. W. Bratton, Philadelphia, Pa., and H. Nunez, New York, N. Y. Multiple-wire system of electrical distribution	407,485	July 23	2218	573	48	457
Lighthipe, James A., assignor to himself and G. W. Bratton, Philadelphia, Pa., and H. Nunez, New York, N. Y. Arc lamp	408,987	Aug. 13	1053	278	48	889
Lightwardt, Henry, Jr., and C. F. Bachler, Philadelphia, Pa. Bottle-stopper	410,421	Sept. 3	447	119	48	1356
Likes, William, Osceola, Iowa. Neck-yoke	411,458	Sept. 24	2004	532	48	1678
Lilley, Henry, assignor to Lilley & Hillsley, Philadelphia, Pa. Machine for making plumbers' hooks	408,184	July 30	3271	854	48	663
Lilley & Hillsley. (See Lilley, Henry, assignor.)						
Lilly, Francis G., Jamestown, N. Y. Petroleum-burner	408,245	Aug. 6	67	16	48	692
Limont, Alexander H., Waterbury, Conn., assignor to Holmes, Booth & Haydens, New York, N. Y. Tubing	408,728	Aug. 13	815	215	48	841
Limont, Alexander H., Waterbury, Conn., assignor to Holmes, Booth & Haydens, New York, N. Y. Making duplex tubing	408,729	Aug. 13	816	215	48	841
Lincoln, George E., New York, N. Y., assignor, by mesne assignments, of one-half to J. R. Conner, Brooklyn, N. Y. Galley	407,539	July 23	2300	593	48	474
Lindenmayer, Jacob, assignor of one-half to P. A. Kratz, Syracuse, N. Y. Stove-pipe fastener	408,020	July 30	3010	781	48	616
Lindley, Leonard, Nottingham, England. Machine for finishing lace or other fabrics	408,492	Aug. 6	432	113 114	48	764
Lindrum, Friederick, Chicago, Ill. Boiler-setting	406,357	July 2	469	131	48	94
Lindrum, Friederick, Chicago, Ill. Boiler-cleaner	406,358	July 2	470	132	48	94
Lindrum, Friederick, Chicago, Ill. Tube for steam-boilers	406,359	July 2	471	132	48	95
Lindsay, John R. (See Hoke, Quinton J., assignor.)						
Lindsey, William E., Arcata, Cal. Cartridge-shell	408,246	Aug. 6	67	16	48	692
Lindsley, William D., Hunkerville, Kans. Seeding attachment for plows	406,360	July 2	472	132	48	95
Lingle, John M., assignor of one-half to P. F. Brashear, Sedalia, Mo. Vehicle-hub	408,730	Aug. 13	817	215	48	842
Linsley, Florence, executrix. (See Linsley, Newton.)						
Linsley, Newton, deceased, Freeport, Ill.; F. Linsley executrix. Tool-handle	409,989	Aug. 27	2691	706	48	1216
Lipe, Charles E., Syracuse, N. Y., assignor to Hand Stitch Broom Sewing Machine Company, Pittsburg, Pa. Broom-corn-sizing machine	410,840	Sept. 10	1093	292	48	1468

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drg.	Official Gazette. Vol.	Official Gazette. Page.
Lipe, Willard C., Syracuse, N. Y. Box-catch	406,173	July 2	212	58	48	42
Lippold, Henry, Jr., Corry, Pa. Corn-sheller	407,829	July 30	2716	703	48	561
Lippy, David, Mansfield, Ohio. Pipe-coupling	409,473	Aug. 20	1933	512	48	1068
Lipton, Erastus B. (See Kennedy, David, Jr., assignor.)						
Lister, George. (See Brining, Thomas, assignor.)						
Litchfield, Pliny T., Southbridge, Mass. Loom-shuttle	407,958	July 30	2915	700	48	599
Little, Addison M. (See Little, Orton C. and A. M.)						
Little, E. Knox, *et al.* (See Wray, Robert, assignor.)						
Little, George E. (See Little, William H., assignor.)						
Little, James R., assignor, by mesne assignments, to Quincy Metal Wheel Company, Quincy, Ill. Manufacture of metal wheels	406,747	July 9	1086	280	48	220
Little, James R., assignor to Quincy Metal Wheel Company, Quincy, Ill. Manufacturing metal wheels	409,474	Aug. 20	1934	513	48	1069
Little, James R., assignor to Quincy Metal Wheel Company, Quincy, Ill. Metal wheel	409,475	Aug. 20	1935	513	48	1069
Little, John E., Princeton, Ind. Gate	406,117	July 30	3168	820	48	645
Little, Orton C. and A. M.; said Orton C. Little assignor to D. T. H. MacKinnon, Menasha, Wis. Key-seat-cutting machine	406,525	July 9	756	200	48	158
Little, William F., Jonesborough, Ark. Churn	411,667	Sept. 24	2313	613	48	1743
Little, William H., Picture Rocks, Pa., assignor of one-half to G. E. Little, Washington, D. C. Clothes-drier	409,642	Aug. 20	2180	574	48	1113
Littlefield, Landan M., Valdosta, Ga. Churn-dasher	407,672	July 23	2477	641	48	509
Littman, Selig. (See Schneekloth, Hans A., assignor.)						
Lively, Louis P. (See Lively, Robert M. and L. P.)						
Lively, Robert M. and L. P., Canton, Tex. Gate	410,644	Sept. 10	777	210	48	1427
Livermore, James H. (See Leighton, Arthur M., assignor.)						
Livingston, Andrew W., and G. Wilcox, San Francisco, Cal. Soldering-machine	410,761	Sept. 10	980	265	48	1463
Livingston, Thomas P., *et al.* (See Phillips, Edwin G., assignor.)						
Livingstone, William, Jersey City, N. J. Sash-fastener	406,493	Aug. 6	437	115	48	765
Livingstone, William, Jersey City, assignor of one-half to J. Toler, trustee, Newark, N. J. Caster	411,747	Sept. 24	2496	643	48	1766
	407,021	July 16	1496	391	48	308
Lloyd, James C., Chicago, Ill. Planter	406,453	July 9	629	177	48	136
Lloyd, John U., Cincinnati, Ohio. Device for evaporating liquids	407,408	July 23	2100	{542 543	{48	433
Lloyd, Seth, West New Brighton, N. Y., assignor to Old Bangor Slate Company, Bethlehem, Pa. Machinery for grinding the edges of a series of slabs of slate, &c.						
Lobdell, Henry, Troy, N. Y. Water-power vessel-propelling mechanism	408,310	Aug. 6	154	39	48	709
Locke, Warren E., West Somerville, assignor of one-third to T. F. Hovey, Boston, Mass. Pie-turner	406,654	July 9	952	257	48	194
Lockwood, Frederick J., Bridgeport, Conn. Check-punch	409,294	Aug. 20	1677	422	48	1017
Lockwood, George E. (See Van Kannel and Lockwood.)						
Loe, Silver, assignor of one-half to M. Anderson, La Crosse, Wis. Car-coupling	407,296	July 16	1918	499	48	391
Loetscher, Christian, Dubuque, Iowa. Screen and storm door	409,750	Aug. 27	2352	619	48	1152
Loewer, Henry, and B. L. Blair, assignors of one-fourth to A. S. McNab, Rochester, N. Y. Sole-cutting machine	407,735	July 23	2561	653	48	526
	407,083	July 16	1578	404	48	324
Lofer, Solomon, Maitland, Mo. Hog-trap						
Löffler, Andrew. (See Ford, Edward C., assignor.)						
Lofts, Ezra, Cambridge, England. Stove	411,459	Sept. 24	2004	525	48	1679
Loftus, John, assignor of one-half to E. W. Smith, Albany, N. Y. Detachable coupler for connecting supply-pipes of steam-heating apparatus for railway-cars	409,109	Aug. 13	1390	356	48	953
Logan, John, Waltham, Mass. Apparatus for testing watch-balances and hair-springs	406,655	July 9	953	256	48	194
Logan, John F. (See Campbell, John W., assignor.)						
Logan, John H. (See Culmer, John W., assignor.)						
Logan, Thomas H., Lowell, Mass. Support for spinning-spindles	408,185	July 30	3272	854	48	663
Lohagen, John A., Milwaukee, Wis. Knockdown music-rack	406,921	July 16	1354	355	48	221
Lomont, Francis T., deceased; M. P. Lomont, Fort Wayne, Ind., administratrix. Road-scraper	410,249	Sept. 3	169	44.45	48	1301
Lomont, Mary P., administratrix. (See Lomont, Francis T.)						
Long & Allstatter Company. (See Allstatter, Robert, assignor.)						
Long, Benjamin, Boulder, Colo. Gun-sight	410,422	Sept. 3	448	119	48	1356
Long, Charles, Toronto, Ontario, Canada. Heating attachment for gas-burners	411,126	Sept. 17	1525	407	48	1583
Long, Charles R., Louisville, Ky. Spectacle-case	410,798	Sept. 10	1038	278	48	1477
Long, Henry C., and I. B. Walker, Salem, Mo. Combined hay rake and loader	408,494	Aug. 6	439	115	48	766
Long, William A. N., Boston, Mass. Carving-machine	407,736	July 23	2564	664	48	597
Longacre, Matthias R., Philadelphia, Pa. Cash register and indicator	406,748	July 9	1086	{289 290	{48	220
Longacre, Matthias R., Philadelphia, Pa. Cash register and indicator	406,749	July 9	1092	{290 291	{48	221
Loomis, Alvah, assignor of one-half to J. W. Brough, St. Albans, Vt. Piston-valve	410,906	Sept. 10	1187	321	48	1506
Loomis Electric Manufacturing Company. (See Loomis, Osborn P., assignor.)						
Loomis, Justin H., Vail's Gate, N. Y. Butter-cutter	411,509	Sept. 24	2213	569	48	1722
Loomis, Lysander N., Wauwatosa, Wis. Animal-trap	409,212	Aug. 20	1551	410	48	992
Loomis, Osborn P., Somerville, Mass., assignor to Loomis Electric Manufacturing Company, of New York. Commutator brush and holder	407,225	July 16	1816	475	48	371
Loomis, Osborn P., assignor to Loomis Electric Manufacturing Company, New York, N. Y. Regulation of coupled dynamos	410,170	Sept. 3	47	12	48	1278
	406,750	July 9	1096	291	48	222
Loppentien, Johan D., Pittsburg, Pa. Violin	408,118	July 30	3169	{828 829	{48	646
Lord, George E., Utica, N. Y. Chair	406,664	Aug. 6	765	192	48	814
Loree, James K., assignor of one-half to J. M. Bradley, Iosco, Mich. Buggy-boot	406,526	July 9	759	206	48	159
Lorenz, Wilhelm, Carlsruhe, Baden, Germany. Tubular lance	410,843	Sept. 10	1093	{295 296	{48	1489
Lorenz, William A., Hartford, Conn., assignor to F. W. Leinbach and C. A. Wolle, Bethlehem, Pa. Paper-bag machine						
Lorenz, William A., assignor of one-half to E. E. Clanssen, Hartford, Conn. Making paper bags	411,288	Sept. 17	1752	469	48	1628
Lorenz, William A., and E. E. Clanssen, Hartford, Conn., assignors to F. W. Leinbach and C. A. Wolle, Bethlehem, Pa. Paper-bag machine	410,841	Sept. 10	1094	{292 293 294	{48	1488
Lorenz, William A., and W. H. Honiss, Hartford, Conn., assignors to F. W Leinbach and C. A. Wolle, Bethlehem, Pa. Paper-bag machine	410,842	Sept. 10	1097	{294 295	{48	1488
Loretz, Arthur J. L., Brooklyn, N. Y. Water regulator and accumulator for house purposes	407,890	July 30	2718	705	48	561
Loreta, Arthur J. L., Brooklyn, N. Y. High-service pumping-engine	411,724	Sept. 24	2392	634	48	1759
Lorey, William, assignor of two-thirds to C Geta Philadelphia and F. S. Dickensbied, Hosensack, Pa. Vise	407,486	July 23	2219	573	48	457
Lorimer, John H., Philadelphia, Pa. Apparatus for treating textile fabrics	406,143	July 2	168	48	48	35
Loring, George A., assignor to P. J. Larrabee, Portland, Me. Bench-clamp	409,295	Aug. 20	1677	442	48	1017

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drg.	Official Gazette. Vol.	Official Gazette. Page.
Lorraine, Madison J., St. Louis, Mo., assignor, by mesne assignments to Keystone Car Coupler Company, of Illinois. Car-coupling	411,289	Sept. 17	1753	469	48	1628
Loso, John H., assignor of one-half to W. S. Maxwell, Los Angeles, Cal. Combined wrench and oil-can	409,476	Aug. 20	1936	512	48	1069
Lottridge, William. (See Pettit and Lottridge.)						
Lotz, Friedrich, assignor to J. A. Amundson, New York, N. Y. Galvanic battery	406,656	July 9	955	258	48	195
Loud, Waldo A., Springfield, Mass. Lawn-mower	410,366	Sept. 3	358	95	48	1339
Lough, John A., Chetopa, Kans. Belt-gearing	410,367	Sept. 3	360	96	48	1340
Loughary, La Fayette W., Monmouth, Oreg. Gate	408,351	Aug. 6	215	55	48	721

Love, Joseph W., assignor of one-half to A. Beck, Baltimore, Md. Ash-sifter	406,224	July 2	277	77	48	55
Love, Matthew S. (See Moore and Love.)						
Lovejoy, Fred. E. (See Bachelder and Lovejoy.)						
Loveless, Charles B., Worthington, Minn. Chimney-cowl and ventilator	409,990	Aug. 27	2891	706	48	1216
Lovibond, Joseph W., Salisbury, county of Wilts, England. Kaleidoscope	407,937	July 30	2881	750	48	592
Low, Abbott A. (See Johnson and Low.)						
Low, Abbott A., Brooklyn, assignor to Alden Type Machine Company, New York, N. Y. Type-distributing apparatus	409,690	Aug. 27	2986	{595 596 597	{48	1135
Low, Hamilton F. (See Bacon and Low.)						
Low, Hamilton F., assignor to Triumph Self-Wringing Mop Company, Manchester, N. H. Mop-head	408,495	Aug. 6	443	116	48	766
Low, John G., Chelsea, Mass. Soda-fountain	408,868	Aug. 13	1055	278	48	990
Lowden, James J., Boston, Mass. Steam-pressure or damper regulator	408,869	Aug. 13	1057	279	48	990
Lowden, Leonidas C., Indianapolis, Ind. Wire-fence machine	409,477	Aug. 20	1937	513	48	1069
Lowe, Frank W., Boston, Mass. Gage-knife	409,849	Aug. 27	2505	655	48	1178
Lowe, James, Philadelphia, Pa. Spinning-mule	407,783	July 30	2939	{683 684	{48	547
Lowell, Charles H., trustee. (See Patterson, William D. C., assignor.)	409,213	Aug. 20	1552	410	48	992
Lowry, Charles A., Knoxville, Tenn. Paper-bag and twine holder	410,323	Sept. 3	300	78	48	1327
Loynd, Richard B., assignor of one-half to Knowles Loom Works, Worcester, Mass. Pile-fabric loom	407,400	July 23	2101	543	48	433
Lucas, Harry, Birmingham, county of Warwick, England. Lamp for velocipedes	407,601	July 23	2381	{617 618	{48	491
Lucas, William M., Uhrichsville, Ohio. Flour-bolt	410,171	Sept. 3	48	13	48	1278
Lucigen Light Company. (See Grimston, George S., assignor.)	408,478	Aug. 20	1938	513	48	1069
Luckenbach, Frederic A., New York, N. Y. Preventing the flouring of mercury						
Lucky, Simon K., Long Bottom, Ohio. Hay-fork	406,361	July 2	474	133	48	95
Ludington, Frank J. (See Pollard and Ludington.)	411,158	Sept. 17	1571	418	48	1591
Ludwig, Heinrich E., Berne, Switzerland. Pulley	409,110	Aug. 13	1391	{366 367	{48	953
Luebben, Melchior L., Sutton, Nebr. Hand-stamp	409,214	Aug. 20	1553	411	48	993
Luebra, Michel D., and D. S. Coe, assignors to Acme Machinery Company, Cleveland, Ohio. Bolt heading and forging machine						
Luetke, Oscar, Brooklyn, N. Y. Standard for lamps						
Lull & Co., L. C. (See Kipp, Henry D., assignor.)						
Lund, Joseph. (See Smith and Lund.)						
Lunkenheimer Brass Manufacturing Company. (See Lunkenheimer, Edmund, assignor.)						
Lunkenheimer, Edmund, assignor to Lunkenheimer Brass Manufacturing Company, Cincinnati, Ohio. Oil-cup	409,215	Aug. 20	1554	411	48	993
Lunkenheimer, Edmund, assignor to Lunkenheimer Brass Manufacturing Company, Cincinnati, Ohio. Grease-cup	410,423	Sept. 3	450	119	48	1357
Lunn, David H., Ferndale, Cal. Wire-stretcher	411,600	Sept. 24	2214	589	48	1722
Luscomb, Frederick W., and D. A. Corey, New Bedford, Mass. Drilling-machine	410,762	Sept. 10	982	263	48	1463
Lutticke, George F., London, England. Toy locomotive	409,991	Aug. 27	2883	707	48	1216
Lutticke, George F., London, England. Mechanism for operating dancing, acrobatic, and other toy figures	410,907	Sept. 10	1188	321	48	1506
	408,247	Aug. 6	60	.....	48	692
Lyall, James, New York, N. Y. Manufacturing binder-twine	410,903	Sept. 10	1300	351	48	1529
Lyles, John H., and E. C. Ward, Parsons, Kans. Hub-attaching device						
Lyman, Moses. (See Crandall, Charles M., assignor.)	406,454	July 9	630	177	48	136
Lynch, Charles D., Detroit, Mich. Steam-whistle	407,410	July 23	2103	543	48	434
Lynch, Matthew, Malta Bend, Mo. Stock-watering tank						
Lynch, Peter. (See Wendlick and Lynch.)						
Lyne, Thomas B. (See Russell, Charles M., assignor.)	410,799	Sept. 10	1039	278	48	1477
Lynn, Robert, Sr., Brighton, Iowa. Wagon-tongue support						
Lynne, James H. (See Yarborough, Cora M., assignor.)						
Lyon, Benjamin, Bridgeport, assignor, by mesne assignments, to G. S. Smith, Norwich, Conn. Belt-fastener	406,106	July 2	117	34	48	25
	409,111	Aug. 13	1394	{367 368	{48	954
Lyon, Samuel, Pultneyville, N. Y. Paring and coring machine	406,362	July 2	476	133	48	95
Lytle, Murdick, Duke Centre, Pa. Operating oil-wells						
Mabie, George W., *et al.* (See Sageman and Seibold, assignors.)						
MacArthur, John S., Pollokshields, county of Renfrew, Scotland. Extracting precious metals from their ores	411,047	Sept. 17	1388	.....	48	1556
MacKinnon, Duncan T. H. (See Little, Orton C. and A. M., assignors.)	408,922	Aug. 13	1103	291	48	899
MacKnight, John W., New York, N. Y. Fire-proof ceiling	407,299	July 16	1922	500	48	391
Macdonald, Thomas J. A., Detroit, Mich. Sale-slip						
Mackenzie, John. (See Perry and Mackenzie.)	408,496	Aug. 6	444	116	48	766
Macker, Dean W., Grafton, Mass. Threshold-measuring gage	411,159	Sept. 17	1574	418	48	1592
Mackey, John C., Detroit, Mich. Portable steam-radiator						
Macklin Adjustable Car Seat Company. (See Macklin, Athol B., assignor.)						
Macklin, Athol B., Toronto, Ontario, Canada, assignor to Macklin Adjustable Car Seat Company, Chicago, Ill. Car-seat	407,022	July 16	1497	392	48	308
Macomber, Clarence R., assignor to Worcester Fire Appliance Company, Worcester, Mass. Chemical fire-extinguishing apparatus	411,552	Sept. 24	2138	{566 567	{48	1706
Macres, Henry E., Hudson, N. Y. Fence	406,657	July 9	956	258	48	195
Maddin, Mary, *et al.* (See Maddin, Samuel D., assignor.)						
Maddin, Samuel D., assignor to M. Maddin and A. Tetrault, Miamisburg, Ohio. Grain-binder	409,795	Aug. 27	2498	{636 637	{48	1165
Maddin, Samuel D., Miamisburg, Ohio, assignor to M. Maddin, Sarnia, Ontario, Canada. Grain-binder	410,424	Sept. 3	450	{119 120 121 122	48	1357
Madigan, Patrick T., Troy, N. Y. Car-coupling	411,460	Sept. 24	2006	533	48	1679

Alphabetical list of patentees, July to September, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Maeriens, Emile, Providence, R. I. Tension-regulating device for driving-bands of spinning-machines	409,412	Aug. 20	1847	468	48	1051
Maenrer, Henry, Brooklyn, N. Y. Clothes-line attachment	409,327	Aug. 20	1723	453	48	1026
Maffett, Albert, Hayesville, Ohio. Bag-tie	410,172	Sept. 3	49	13	48	1278
Magaldi, Michele, New York, N. Y. Fire-extinguisher	409,796	Aug. 27	2432	637	48	1166
Magee, Daniel W., New York, N. Y. Flexible pipe-joint	409,216	Aug. 20	1555	411	48	993
Magnus, Edwin R., New Britain, Conn. Dentist's bench-block	411,461	Sept. 24	2007	533	48	1679
Magnusson, Howard C., Chicago, Ill. Horseshoe-bar	409,850	Aug. 27	2506	655	48	1178
Maher, Michael R., Zanesville, Ohio. Self-sealing bung for ice-cream freezers	410,400	Sept. 10	1040	278	48	1477
Mahle, Clemence A., Corry, Pa. Machine for making wooden curry-combs	411,345	Sept. 17	1641	492	48	1643
Mahle, Clemence A., Corry, Pa. Brush-block-boring machine	411,346	Sept. 17	1643	492	48	1643
Mahlmann, George W., Chicago, Ill. Faucet	409,691	Aug. 27	2270	597	48	1136
Mahoney, William P., Newburyport, Mass., assignor of one-half to C. H. Folsom, Brooklyn, N. Y. Machine for starting hat-bodies	406,658	July 9	957	258	48	195
Maierhoefer, Frederick. (See Schubert and Maierhoefer.)						
Main, William, Brooklyn, N. Y. Power-transmitting device	407,085	July 16	1579	414 415	48	324
Main, William, Brooklyn, N. Y. Power-transmitting connection for vehicles	407,086	July 16	1583	415 416	48	325
Main, William, Brooklyn, N. Y. Power-transmitting device	407,087	July 16	1589	417 418	48	326
Main, William, Brooklyn, N. Y. Power-transmitting device	407,088	July 16	1595	419	48	328
Main, William, Brooklyn, N. Y. Transmitting power	407,089	July 16	1598	419	48	328
Main, William, Brooklyn, N. Y. Power-transmitting device	407,090	July 16	1600	420	48	329
Main, William, Brooklyn, N. Y. Power-transmitting device	407,091	July 16	1603	420	48	330
Main, William, Brooklyn, N. Y. Power-transmitting device	407,092	July 16	1607	420	48	331
Main, William, Brooklyn, N. Y. Vehicle-propulsion by electric motors	407,093	July 16	1609	421 422	48	332
Main, William, Brooklyn, N. Y. Car-propelling apparatus	407,094	July 16	1612	422 423	48	332
Main, William, Brooklyn, N. Y. Vehicle-propulsion	407,095	July 16	1618	423 424	48	333
Mair, Charles R., *et al.* (See Dunlap, John W., Sr., assignor.)						
Maish, Wilbur F. (See Kohler, Amos, assignor.)						
Maitland, Thomas, Williamsport, Pa. Clothes-pounder	406,311	Aug. 6	155	39	48	710
Major, Emanuel, assignor of one-fourth to J. H. Stedman, Rochester, N. Y. Regulator for hot-water heating apparatus	407,784	July 30	2641	684	48	548
Makepeace, Abel D., *et al.* (See Bee, Benjamin F., assignor.)						
Malandin, Léon P. C. (See Debouttéville and Malandin.)						
Maley, Thomas H., Andover, Dak. Ter. Carpet-stretcher	407,540	July 23	2301	594	48	474
Mallary, D. D. (See Brooks, William D., assignor.)						
Mallory, Charles H., Springborough, Pa. Tool for grinding reaper-cutters	407,023	July 16	1499	392	48	309
Malone, Micajah C., assignor of one-half to F. B. Spooner, Palmyra, Ill. Combined metal shears and tire-upsetter	411,386	Sept. 17	1693	506	48	1652
Maloney, James A., assignor to M. J. Colbert, trustee, Washington, D. C. Specnlum	411,160	Sept. 17	1575	419	48	1592
Maloney, Patrick, and G. Robertson, assignors of one-third to G. A. Jacobs, Red Creek, N. Y. Spout for vessels	410,908	Sept. 10	1189	321	48	1506
Maloy, James W., Marietta, Ga. Implement for reducing stone, &c.	409,051	Aug. 13	1297	342	48	935
Maloy, James W., Marietta, Ga. Implement for reducing stone, &c.	409,052	Aug. 13	1297	342	48	936
Malquist, John, Salt Lake City, Utah Ter. Forge-tuyere	408,120	July 30	3172	829	48	646
Manahan, Margaret E. (See Manahan, Thomas, assignor.)						
Manahan, Thomas, assignor to M. E. Manahan, New York, N. Y. Waterproofing compound	409,479	Aug. 20	1939	.....	48	1069
Maubes, Pierre, Lyons, France. Refining nickel	409,992	Aug. 27	2694	.....	48	1217
Mani, John, French Gulch, Cal. Vehicle-brake	408,421	Aug. 6	329	85	48	743

Meier, John B., Port Huron, Mich., assignor of one-half to B. J. Karrer. Nut-wrench	410,985	Sept. 10	1303	351	48	1529
Meigs, Arthur, *et al.* (See Tracy, William P., assignor.)						
Meikle, Hugh F. (See Meikle, Thomas, assignor.)						
Meikle, Thomas, assignor of one-half to H. F. Meikle, Louisville, Ky. Fagot	411,748	Sept. 24	2427	643	48	1766
Meiser, Franz. (See Leuchs and Meiser.)						
Meister, David A. (See Oulton and Meister.)						
Melchior, Ludwig, and G. Haas, Wilmington, Del. Spring-motor	407,939	July 30	2883	750	48	592
Melendy, Hervey D., Nashua, N. H. Spool	408,732	Aug. 13	818	216	48	842
Melhouse, Andrew B., Villard, Dak. Ter. Distance-instrument	407,786	July 30	2644	685	48	549
Mellino, William, *et al.* (See Card, William J., assignor.)						
Mellon, John S., assignor of six-tenths to G. W. Lewis, St. Louis, Mo. Galvanic shoe	407,673	July 23	2478	641	48	509
Melrose, Thomas H., San Francisco, Cal. Speed-controlling device for elevators	409,995	Aug. 27	2699	709	48	1218
Menger, Ottomar. (See Ewig, John, assignor.)						
Mercer, James D., Ottawa, Ohio. Cornstalk-cutter	410,369	Sept. 3	362	96	48	1340
Mercer, Thomas M. (See Vail, Joseph C., assignor.)						
Merchants Roll Paper Supply Company. (See Kennedy, Guy L., assignor.)						
Meriam, Benjamin, Boston, Mass. Drain-tester	408,527	July 9	759	206	48	159
Meriden Bronze Company. (See Miller, John C., assignor.)						
Meriden Bronze Company. (See Peck, Eugene H., assignor.)						
Merrell, Gains L., Syracuse, N. Y. Can-filling machine	406,926	July 16	1361	357	48	282
Merrill, John S., Columbus, Ohio. Bracket for electric lamps	409,852	Aug. 27	2508	656	48	1179
Merriman, John, Saugerties, N. Y. Constructing lead-lined converters	406,927	July 16	1365	357	48	283
Merritt, Charles H., Danbury, Conn. Hat sizing or shrinking machine	406,456	July 9	638	179	48	137
Merritt, James C., Highland Falls, N. Y. Stereotype block	410,714	Sept. 10	896	242	48	1447
Meriwether, William A., *et al.* (See Gathright, John R., assignor.)						
Merrow, Oscar L. (See Sanborn and Merrow.)						
Mersman, James B., La Grange, Ind. Folding wash-bench	408,123	July 30	3175	830	48	647
Mertz, Nathaniel D., Plum River, Ill. Refrigerator	410,911	Sept. 10	1191	322	48	1507
Meserole, Abraham V., New York, N. Y., assignor of one-half to H. A. Wilson, Ridgefield, N. J. Electrode for secondary batteries	408,809	Aug. 13	934	249	48	867
Messer, George E., Boston, Mass. Lamp-wick holder	408,313	Aug. 6	158	40	48	710
Messer, Gerry C. (See Messer, Leverett, assignor.)						
Messer, Horace W., Berlin, Ontario, Canada. Swinging chair or hammock	407,099	July 16	1626	425	48	334
Messer, Leverett, Haverhill, Mass., assignor of one-half to G. C. Messer, Brattleborough, Vt. Adjustable picture-hanger	409,644	Aug. 20	2183	575	48	1114
Messimer, Henry E., Williamsport, Pa. Attaching device for suspender straps	409,694	Aug. 27	2273	598	48	1137
Metcalf, Foster M., assignor of one-half to W. Andrus, Battle Creek, Mich. Constructing spring packing-rings	410,426	Sept. 3	457	122	48	1338
Metford, William E. (See Halford and Metford.)						
Metz, Frank, assignor of one-half to J. Corbus, New Brighton, Pa. Cork-machine	406,225	July 2	278	77	48	56
Metzger, Gustav, Newark, N. J. Compound compressor	411,252	Sept. 17	1703	455	48	1618
Metzler, Paul G., and R. S. Davis, Leadville, Colo. Liquid-blacking box	409,415	Aug. 20	1852	489	48	1052
Metzner, William C., Chicago, Ill. Stove-grate	407,767	July 30	2646	685	48	549
Metzner, William C., Chicago, Ill. Stove-damper	410,646	Sept. 10	779	211	48	1428
Mey, Fredrick H. C., Buffalo, N. Y. Conveyer	408,733	Aug. 13	819	216	48	842
Meyer, Benjamin F. (See Knowlton and Meyer.)						
Meyer, Emil, Berlin, Germany. Obtaining methyl alcohol from wood-pulp lyes	407,442	July 23	2160		48	446
Meyer, Henry H., Atkinson, Nebr. Sash-fastener	411,128	Sept. 17	1536	407	48	1582
Meyer, Leopold, Ahnapee, Wis. Siphon	408,918	Aug. 13	1099	290	48	898
Meyer, Max, assignor to R. B. Ayres, New York, N. Y. Thermometric indicator	409,196	Aug. 27	2702	709	48	1218
Meyer, Philip, and W. Schrage, Sheboygan, Wis. Fodder-cutter	406,660	July 9	950	259	48	196
Meyer-Sniffen Company. (See Bunting, William, Jr., assignor.)						
Meylan, Charles H., assignor to Mathey Brothers, Mathez & Co., New York, N. Y. Watch-barrel	410,327	Sept. 3	305	79	48	1328
Meyrose, Ferdinand. (See Stempel, Omar A., assignor.)						
Meyrowitz, Emil B., Ridgefield, N. J., assignor to Levy, Dreyfus & Co., New York, N. Y. Opera-glass holder	411,527	Sept. 24	2009	554	48	1697

Miller, John D., Ottoville, Ohio. Fence	410,912	Sept. 10	1192	322	48	1507
Miller, John D., assignor of one-half to J. A. Baker, Washington, D. C. Draft attachment for vehicles	406,755	July 9	1103	293	48	223
Miller, John H., Lewistown, Pa. Thill-coupling jack	408,921	Aug. 13	1102	291	48	899
Miller, John H., Newark, Ohio. Baking-oven	410,913	Sept. 10	1193	322 / 323	48	1507
Miller, Joseph, assignor to J. Miller and H. Snow, Greenfield, Ind. Automatic cut-off	406,847	July 9	1243	329	48	248
Miller, Joseph F., Hamburg, Iowa. Reel-carriage	408,499	Aug. 6	447	117	48	767
Miller, Joseph M., Chicago, Ill. Discharge-cock for fire-extinguishers	408,423	Aug. 6	331	86	48	744
Miller, Lewis. (See Davis, Charles D., assignor.)						
Miller, Lewis, Akron, Ohio. Lifting-jack	407,788	July 30	2647	685 / 686	48	549
Miller, Lewis, Akron, Ohio. Grain-binder	410,427	Sept. 3	459	123 / 124	48	1358
Miller, Ludvic M., Winneconne, Wis. Vehicle-hub	409,054	Aug. 13	1300	343	48	936
Miller, Luther L. (See Shoudy and Miller.)						
Miller, Michael M. (See Grant, Alexander, assignor.)						
Miller, Peter J., Upper Lehigh, Pa. Fastener for envelopes, boxes, &c	411,045	Sept. 17	1385	371	48	1555
Miller, Robert B., *et al.* (See Kittredge, Anson O., assignor.)						
Miller, Robert C., Channahon, Ill. Weather-strip	407,443	July 23	2161	558	48	446
Miller, Samuel J., Cambridge City, Ind. Fence-post	407,365	July 23	2037	528	48	421
Miller, Simon, Philadelphia, Pa. Shirt	410,328	Sept. 3	307	79	48	1328
Miller, Thomas T. (See Steiner, Henry W., assignor.)						
Miller, Uriah E., Heilig's Mill, N. C. Running-gear	406,226	July 2	281	78	48	57
Miller, Uriah E., Heilig's Mill, N. C. Quilting-frame	406,929	July 16	1367	358 / 359	48	284
Miller, William I. (See McKenzie and Miller.)						
Miller, William J., Mamaroneck, N. Y., assignor to E. & T. Fairbanks & Company, St. Johnsbury, Vt. Weighing-scales for suspension-tramways	411,507	Sept. 24	2070	548	48	1692
Milliken, Charles H. (See Milliken and D'Amour.)						
Milliken, George F., Boston, assignor of one-half to A. P. Sawyer, Newburyport, Mass. Signaling apparatus	407,101	July 16	1028	426	48	335
Milliken, John A., New York, C. H. Milliken and E. D'Amour, assignors of one-fourth to C. F. Smith, Brooklyn, N. Y. Ticket-printing machine	410,555	Sept. 3	632	169 / 170	48	1392
Mills, Daniel, Philadelphia, Pa. Button-hole attachment for sewing-machines	408,500	Aug. 6	448	117 / 118	48	767
Mills, Dwight P., Naugatuck, Conn. Bobbin	407,831	July 30	2719	706	48	561
Mills, Dwight P., Naugatuck, Conn. Making blanks for knitted drawers	410,600	Sept. 10	701	187	48	1412
Mills, George W. (See Jordan, Mills, and Jordan.)						
Mills, Mortimer B., Chicago, Ill. Derailing mechanism for railway-crossings	408,840	Aug. 13	977	259	48	874
Mills, William F. (See Flint, Samuel E., assignor.)						
Milwaukee Harvester Company. (See Crandall, Henry F., assignor.)						
Milwaukee Harvester Company. (See Graham, James A., assignor.)						
Milwaukee Harvester Company. (See Latimer, John W., assignor.)						
Milwaukee Harvester Company. (See Riley, Edward, assignor.)						
Minor, Henry C. (See Ghirardi, Etienne, assignor.)						
Mishler, Phares M., Hagerstown, Md. Portable fence	406,053	July 2	44	13	48	11
Mishler, Phares M., Hagerstown, Md. Hedge	410,914	Sept. 10	1194	323	48	1507
Mishler, Phares M., Hagerstown, Md. Hedge	411,464	Sept. 24	2012	534	48	1680
Misic, Michael, and E. Schweizer, Brooklyn, N. Y. Valve-gear for pumping-engines	409,654	Aug. 27	2510	656 / 657	48	1179
Missud, John A., New Orleans, La. Sewer-pipe	407,102	July 16	1031	426	48	335
Mitchell, Andrew W., Detroit, Mich. Shot-proof cage for railway-cars	407,832	July 30	2720	706	48	561
Mitchell, Charles C., Ann Arbor, Mich. Transom-lifter	411,465	Sept. 24	2013	534	48	1680

Alphabetical list of patentees, July to September, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drg.	Official Gazette. Vol.	Official Gazette. Page.
Mitchell, Charles P., Boston, Mass. Twine package	408,841	Aug. 13	979	259	48	875
Mitchell, Charles P., Boston, Mass. Twine ball	408,842	Aug. 13	980	260	48	875
Mitchell, James G., assignor to Atlantic Refining Company, Philadelphia, Pa. Sectional roof for stills	409,998	Aug. 27	2704	710	48	1218
Mitchell, Joseph T., assignor of two-thirds to J. N. Sullivan and J. R. Wallace, trustee, Shelbyville, Tenn. Pulley	408,632	Aug. 6	651	169	48	805
Mitchell, Kerr M., St. Joseph, Mo. Apparatus for scrubbing and washing gas	407,025	July 16	1500	{392 / 393}	48	309
Mitchell, Nathaniel C., Philadelphia, Pa. Apparatus for washing and separating rubber	408,424	Aug. 6	335	86	48	744
Mitchell, Nathaniel C., Philadelphia, Pa. Mill for grinding and sheeting rubber	408,734	Aug. 13	821	216	48	842
Mitchell, Wickliff B., Owensburg, Ind. Match-safe	409,055	Aug. 13	1301	343	48	936
Mitchell, William P. (See Stump, Christian H., assignor.)						
Mitchum, Bettie, Hammonsville, Ky. Churn	408,126	July 30	3178	831	48	647
Mix, Frank W., New Britain, Conn. Hinge	407,366	July 23	2030	{528 / 529}	48	421
Mixter, Henry M., assignor of one-half to A. A. Elge, Empire, Mont. Ter. Miner's candlestick	410,892	Sept. 10	1042	279	48	1479
Mixter, Jason W., Plymouth, Mass. Saw-swage	406,227	July 2	282	78	48	57
Mixter, Jason W., Plymouth, Mass. Saw-gummer	406,228	July 2	283	78	48	57
Moeckel, Albert C. (See Moeckel, Gustave A. and A. C.)						
Moeckel, Gustave A. and A. C., Allegheny, assignors of one-half to A. H. Heisey, Pittsburg, Pa. Watch-movement box	410,370	Sept. 3	364	97	48	1341
Moffat, George D., assignor to R. P. Pattison, Chicago, Ill. Water-closet	408,038	July 30	3027	792	48	621
Mohan, Michael J., Covington, Ky. Side-saddle tree	406,108	July 2	120	35	48	25
Mohn, John G., and A. Yelles, Reading, Pa. Smoke-consuming apparatus	407,026	July 16	1502	393	48	309
Mohrig, Edwin, San Francisco, Cal. Bicycle	406,681	July 9	961	250	48	196
Mohrmann, Albert M., Port Townsend, Wash. Ter. Stove or furnace damper	411,603	Sept. 24	2218	500	48	1723
Molitor, John P., Vallejo, Cal. Nose-pad for eyeglasses	411,164	Sept. 17	1578	420	48	1592
Molyneux, Barton S., Minneapolis, Minn., assignor to National Water Supply Company, of Minnesota. Automatic electrical fluid-releaser	409,364	Aug. 20	1776	468	48	1036
Mond, Ludwig, Northwich, county of Chester, and C. Langer, London, county of Middlesex, England. Gas-battery	409,365	Aug. 20	1777	{468 / 469}	48	1037
Mond, Ludwig, Northwich, county of Chester, and C. Langer, London, county of Middlesex, England. Obtaining electricity from gas-batteries	409,366	Aug. 20	1781	469	48	1037
Monfort, Charles E., Utica, Mich. Watch-pivot	410,173	Sept. 3	50	13	48	1278
Monk, John, Preston, county of Lancaster, England. Picking-motion for looms	408,501	Aug. 6	451	114	48	768
Monk, Luther S., Bridgeton, Me., assignor of one-half to D. J. Head, Hanover, Mass. Carriage-jack	407,869	July 30	2774	721	48	572
Montelius, Frederick M., West Perry, Pa. Railway-gate	410,915	Sept. 10	1195	322	48	1508
Montgomery, Georgo V., Amsterdam, N. Y., assignor of one-half to A. S. Bridgess. Carriage-bow	407,959	July 30	2916	760	48	599
Montgomery, James H., Denver, Colo. Hoisting apparatus	409,656	Aug. 20	2198	{570 / 571}	48	1116
Montgomery, John, Jarvis, Ontario, Canada. Freight-car door	410,694	Sept. 10	857	230	48	1442
Montmiuy, Charles. (See Matte and Montminy.)						
Moody, Henry T., assignor to Victor Manufacturing Company, Newburyport, Mass. Rail-support	408,892	Aug. 13	1060	280	48	891
Moody, William K., Boston, Mass. Apparatus for holding and washing photographic negatives	411,253	Sept. 17	1704	{455 / 456}	48	1618
Moomy, Joseph G., Erie, Pa. Belt-pulley	410,763	Sept. 10	982	264	48	1464
Moomy, Joseph G., Erie, Pa. Friction-clutch	410,764	Sept. 10	983	264	48	1464
Moomy, Joseph G., assignor to Taper Sleeve Pulley Works, Erie, Pa. Wooden pulley	406,402	July 2	540	151	48	109
Moore, Arthur, Toronto, Ontario, Canada. Grain-scourer	406,931	July 16	1371	359	48	284
Moore, Benjamin F., Ivanhoe, Kans. Corn-cutter	410,371	Sept. 3	365	97	48	1341
Moore, C. D., *et al.* (See Paine, George C., assignor.)						
Moore, Calvin L., Lebanon, Pa. Valve-head for blowing-engines	410,372	Sept. 3	366	97	48	1341
Moore, Commodore D., Pursley, W. Va. Car-coupling	409,855	Aug. 27	2511	658	48	1179
Moore, Daily S., assignor of two-thirds to A. and A. Price, Chicago, Ill. Railway-track layer	408,186	July 30	3274	835	48	663
Moore, Edward Y., and H. B. Tefft, Milwaukee, Wis. Hoisting-machine	411,604	Sept. 24	2219	{500 / 501}	48	1723
Moore, Everett D. (See Applegarth and Moore.)						
Moore, Everett D., assignor of one-half to R. W. Applegarth, Baltimore, Md. Water coil boiler	409,056	Aug. 13	1302	{343 / 344}	48	936
Moore, Everett D., and T. C. Chappell, Baltimore, Md., said Moore assignor to said Chappell. Letter-box	407,870	July 30	2775	721	48	572
Moore, Frank S., Brooklyn, N. Y. Feeder for stoves or lamps for burning oil	406,932	July 16	1373	360	48	285
Moore, Frederic H., Boston, Mass. Apparatus for purifying water	411,292	Sept. 17	1756	470	48	1638
Moore, George C., assignor to J. W. Green, Jr., and Glendale Elastic Fabric Company, Easthampton, Mass. Tension-regulating device for loom-shuttles	407,411	July 23	2104	543	48	434
Moore, George C., assignor to J. W. Green, Jr., and Glendale Elastic Fabric Company, Easthampton, Mass. Loom-shuttle	407,671	July 30	2776	731	48	572
Moore, George C., assignor to J. W. Green, Jr., and Glendale Elastic Fabric Company, Easthampton, Mass. Narrow-ware loom	407,872	July 30	2778	{732 / 733}	48	572
Moore, John T. (See Michalea, Moses A., assignor.)	408,610	Aug. 13	936	249	48	867
Moore, Lindley M., Rochester, N. Y. Truck-basket	411,347	Sept. 17	1644	402	48	1643
Moore, Linn B. and M. S. Love, Morley, Mo. Plant-protector	408,386	Aug. 6	270	67	48	731
Moore, Matthew R., Indianapolis, Ind. Sand-molding machine	409,797	Aug. 27	2433	638	48	1166
Moore, Melville M., Springfield, Mo. Gate-latch	408,314	Aug. 6	158	40	48	710
Moore, Samuel, Providence, R. I. Machine for making bead chains	408,039	July 30	3029	792	48	621
Moore, Seth M., Harper, Kans. Mail-bag fastening	409,695	Aug. 27	2274	598	48	1137
Moore, Stephen F., Milwaukee, Wis. Carving-machine	408,735	Aug. 13	822	217	48	843
Moore, Theophilus W., Fruit Cove, Fla. Device for preserving cut flowers						
Moorhead, Robert J., *et al.* (See Gifford and Allen, assignors.)	406,145	July 2	171	49	48	35
Moos, Henry A., Seguin, Tex. Packing-case						
Moosbrugger, Joseph, assignor of one-third to C. B. McBride, St. Paul, Minn. Cover for barrels. (Reissue)	11,027	Aug. 27	2940	772	48	1202
Moran, John D., New York, N. Y. Chain-wrench	406,662	July 9	962	250	48	196
Morand, Paul J. (See Taft and Morand.)						
Morant, Robert, assignor to J. K. Welch, London, England. Glass or porcelain lined metal T-piece or elbow for pipes	409,112	Aug. 13	1308	368	48	955
Morehouse, Melvin W., and N. S. Kellogg, Brooklyn, N. Y. Pipe-wrench	406,177	July 2	218	59	48	43
Morgan Envelope Company. (See Gibbons, Watson E., assignor.)						
Morgan Envelope Company. (See Hicks, Oliver H., assignor.)						
Morgan, John S., and E. M. Beanblossom, Emporia, Kans. Car-coupling	406,933	July 16	1375	360	48	285

Alphabetical list of patentees, July to September, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drg.	Official Gazette. Vol.	Official Gazette. Page.
Morgan, Richard, *et al.* (See Kleman, Henry, assignor.)						
Morgan, Waltman M., Kansas City, Mo. Car-wheel	409,219	Aug. 20	1558	412	48	994
Morian, Carlos C., assignor of one-half to J. V. D. Coon and M. C. Follett, Olean, N. Y. Hot-soda apparatus	411,293	Sept. 17	1757	470	48	1639
Morley, James H., Florence, assignor of one-half to G. Nightingale, Holyoke, Mass. Sliding door	408,502	Aug. 6	452	119	48	768
Morley, James H., Florence, assignor of one-half to G. Nightingale, Holyoke, Mass. Trolley-track	408,503	Aug. 6	455	119	48	769
Morley, Joseph D., Philadelphia, Pa. Trimming for the edges of fabrics	410,498	Sept. 3	464	125	48	1359
Morley, Joseph D., assignor to Scott, Morley & Co., Philadelphia, Pa. Trimming for fabrics	409,416	Aug. 20	1653	439	48	1052
Moriot, George, Paterson, N. J. Bougie	408,425	Aug. 6	336	87	48	745
Morrin, Thomas F., Jersey City, N. J. Steam-generator	407,940	July 30	2985	751	48	592
Morris Box Lid Company. (See Freidel, Leonard, assignor.)						
Morris, Edward E. (See Norton, Henry M., assignor.)						
Morris, Henry G., and P. G. Salem, Philadelphia, Pa. Apparatus for filling secondary-battery plates	408,986	Aug. 13	1197	{315 / 316}	48	916
Morris, Joseph, London, England. Fountain-pen	407,412	July 23	2105	544	48	434
Morrison, Horatio B., Britt, assignor of three-fourths to F. M. Rogers, C. H. Hughes, and W. H. Cottrell, Mason City, Iowa. Wrench	407,740	July 23	2569	665	48	538
Morrison, John H., Pawtucket, R. I. Feeder for braid-rolls and small spools	408,187	July 30	3275	855	48	664
Morrison, William, Toronto, Ontario, Canada. Boiler	407,229	July 16	1823	476	48	372
Morrissey, Timothy, and J. Doyle, assignors to Ionia Steam Hand Car Company, Ionia, Mich. Steam hand-car. (Reissue)	11,021	Aug. 13	1473	388	48	970
Morrow, Horace G., Bradford, Pa. Head-protector	411,348	Sept. 17	1645	403	48	1643
Morse, John H., *et al.* (See Connett, Martin L., assignor.)						
Morse, Marcellus A., Chicago, Ill. Cupola gas-generating furnace	410,846	Sept. 10	1102	297	48	1490
Morse, Marcellus A., Chicago, Ill., and T. G. Springer, New York, N. Y. Process of and apparatus for manufacturing gas	411,329	Sept. 17	1696	506	48	1653
Morse, Orville M., assignor to Knickerbocker Company, Jackson, Mich. Dust-collector	408,987	Aug. 13	1198	316	48	917
Morse, Orville M., assignor to Knickerbocker Company, Jackson, Mich. Dust-collector	409,482	Aug. 20	1945	515	48	1071
Morse, Charles A. (See Oulton and Meister, assignors.)						
Morton, Joseph C., Hamilton, Mo. Vehicle-brake	408,736	Aug. 13	823	217	48	843
Morton, William S., Edinburgh, county of Mid-Lothian, Scotland. Making decorative embossed work	407,603	July 23	2383	619	48	492
Morton, William S., Edinburgh, county of Mid-Lothian, Scotland. Wall-decorating materials	407,604	July 23	2386	619	48	492
Mortson, George. (See Claussen and Mortson.)						
Moses, Frank D., Zanesville, Ohio. Apparatus for the manufacture of gas	410,174	Sept. 3	51	13	48	1278
Mosher, Charles, South Bend, Ind. Package for dress-stays	407,674	July 23	2479	641	48	509
Mosher, Silas H., assignor to Mosher Tubular Metallic Packing and Manufacturing Company, Chicago, Ill. Glue-heater	410,765	Sept. 10	984	264	48	1464
Mosher Tubular Metallic Packing and Manufacturing Company. (See Mosher, Silas H., assignor.)						
Moskovits, Maximilian H., Kansas City, Mo. Furnace-grate	407,873	July 30	2782	723	48	573
Mosler, Moses, and M. S. Goldsmith, assignors to Mosler Safe and Lock Company, Cincinnati, Ohio. Fire-proof safe	406,848	July 9	1244	329	48	248
Mosler Safe and Lock Company. (See Mosler and Goldsmith, assignors.)						
Mosman, Charles F., assignor to Foster, Merriam & Company, Meriden, Conn. Drawer-pull	407,027	July 16	1503	393	48	310
Motherwell, David M., Logan, Ohio. Bolt	409,696	Aug. 27	2276	599	48	1138
Mott Iron Works, J. L. (See Hammann, Edward, assignor.)						
Mott, Joseph T., Brooklyn, N. Y. Transporting-package for fruit	410,429	Sept. 3	466	125	48	1359
Motter, Jerome B., Mannington, W. Va., and E. B. Todd, assignors of one-eighth to C. L. Schaum, Pittsburg, Pa. Car-coupling	411,466	Sept. 24	2014	{534 / 535}	48	1680
Munat, Thomas G. G., Detroit, Mich. Water-heater	408,249	Aug. 6	70	17	48	692
Mouat, Thomas G. G., and L. Burt, Detroit, Mich. Water-heater	408,893	Aug. 13	1062	280	48	891
Moulton, Edward M. and M., Rochester, N. Y.; said M. Moulton assignor to Edward M. Moulton. Clock	408,605	Aug. 6	706	183	48	814
Moulton, Mark. (See Moulton, Edward M. and M.)						
Mountain, Robert T. (See Martin, Frank F., assignor.)						
Moxham, Arthur J., Johnstown, Pa. Rolling steel or iron	408,843	Aug. 13	981	260	48	875
Moxham, Arthur J., Johnstown, Pa. Rolling iron or steel	408,844	Aug. 13	982	{260 / 261}	48	875
Moyer, Harvey A., Syracuse, N. Y. Spring-vehicle	410,847	Sept. 10	1104	297	48	1490
Moyer, Jesse H., Temple, Tex. Padded hat	409,417	Aug. 20	1654	490	48	1052
Moyer, Jesse H., and J. P. Stansell, Temple, Tex. Dental-drill attachment	408,923	Aug. 13	1101	291	48	899
Moyle, Edward, Grass Valley, Cal. Drill-chuck	410,601	Sept. 10	702	183	48	1412
Mozingo, Lewis W., Kansas City, Mo. Combined water cooler and filter	406,054	July 2	45	13	48	12
Muir, George, Brooklyn, N. Y. Copy-holder	410,602	Sept. 10	703	188	48	1412
Muir, William. (See Ladd and Muir.)						
Muir, William E. (See Childs and Muir.)						
Mullan, John. (See Frazer, William H., assignor.)						
Mullen, Francis M. (See Mullen, Winfield W. and F. M.)						
Mullen, Winfield W. and F. M., Bunker Hill, Ind. Grain-drill	411,528	Sept. 24	2100	554	48	1696

Norwalk Lock Company. (See Hoffman, Henry, Jr., assignor.)						
Norwalk Lock Company. (See Taylor, Thomas, assignor.)						
Norwood, George, Boston, Mass., assignor of one-half to L. Kolb, Cincinnati, Ohio. Vehicle-spring	410,716	Sept. 10	901	243	48	1448
Norwood, Richard W., assignor of one-half to J. C. Grant, Courtland, Ala. Railway-signal	409,648	Aug. 20	2186	576	48	1115
Notley, William, London, county of Middlesex, England. Lamp-extinguisher	407,232	July 16	1825	477	48	373
Notley, William, Peckham, county of Surrey, England. Lamp-burner	409,614	Aug. 20	2139	561 562	48	1106
Nunes, Henry, *et al.* (See Lighthipe, James A., assignor.)						
Nungesser, Philip P., Cleveland, Ohio. Kiln for the manufacture of carbons	409,489	Aug. 20	1954	517	48	1072
Nungesser, Philip P., Cleveland, Ohio. Manufacturing carbons	409,490	Aug. 20	1956	518	48	1073
Nusbaum, George W., Lehighton, Pa. Toy	409,421	Aug. 20	1950	491	48	1053
Nussbeck, Richard. (See Barret and Nussbeck.)						
Nutting, Granville, assignor to United States Watch Company, Waltham, Mass. Pinion-holder for pinion-polishing machines	410,558	Sept. 3	610	170	48	1394
Nyblin, Anders G., Stockholm, Sweden. Dental forceps	408,739	Aug. 13	827	218	48	844
Nye, Walter B. (See Midgley and Nye.)						
Nygaard, Christian, Oshkosh, Wis. Cant-hook	406,297	July 2	376	102	48	76
O'Beirne, William H., New Orleans, La., assignor to Star Iron Tower Company, Fort Wayne, Ind. Mast-arm	410,556	Sept. 3	642	171	48	1394
O'Brian, Leonard W., assignor to Fremont Cultivator Company, Bellevue, Ohio. Clip or saddle rake-tooth holder	408,128	July 30	3179	831	48	648
O'Brian, Leonard W., assignor to Fremont Cultivator Company, Bellevue, Ohio. Right-angle tooth-holder	410,435	Sept. 3	473	127	48	1360
O'Brien, Dennis, Oswayo, Pa. Astronomical mirror	408,511	Aug. 6	468	123	48	771
O'Brien, James P. (See Cooper and O'Brien.)						
O'Brien, Joseph S., Springfield, Mass. Toy	410,010	Aug. 27	2722	716	48	1222
O'Connell, Patrick, assignor to Johnson Company, Johnstown, Pa. Interlocking brace-chair for railway-rails	409,114	Aug. 13	1400	369	48	955
O'Connor, Stephen, Bridgeport, Conn. Sewing-machine	410,011	Aug. 27	2723	716	48	1222
O'Donnell, Bryan, Vail, Iowa. Marking and dropping attachment for corn-planters	410,605	Sept. 10	715	192	48	1414
O'Hearne, John E. (See Riesenberg and O'Hearne.)						
O'Kelly, James M., New York, N. Y., assignor to Automatic Vending Box Company, of New York. Selling-machine	406,593	July 9	844	228	48	175
O'Neil, James C., Cleveland, Ohio. Electric signaling device	406,057	July 2	48	14	48	12
O'Neill, Ellis I. (See Josephs and O'Neill.)						
O'Shea, Dennis, *et al.* (See Sanborn and Merrow, assignors.)						
O'Shea, John, Jr., *et al.* (See Sanborn and Merrow, assignors.)						
Oakes, Lucien R., Valparaiso, Ind. Lamp-burner	408,510	Aug. 6	467	123	48	770
Ober, William Y., Lynn, Mass., assignor to Standard Mining and Ventilating Company, Portland, Me. Ventilator	409,224	Aug. 20	1569	414	48	995
Obrist, Andrew J., Toledo, Ohio. Thill-coupling	410,849	Sept. 10	1106	296	48	1491
Odell, Jabez T., Richmond, Va., and T. J. De Lamere, St. Paul, Minn. Railway-train indicator	407,548	July 23	2315	507 508	48	477
Oehmigen, Richard. (See Werner and Oehmigen.)						
Oestreicher, Daniel, *et al.* (See Clorer, Wilhelm, assignor.)						
Oestreicher, Leopold, *et al.* (See Clorer, Wilhelm, assignor.)						
Office Specialty Manufacturing Company. (See Jewell, Major R., assignor.)						
Offutt, William N., assignor of one-half to J. R. Portness, Keyser, W. Va. Nut-lock	411,674	Sept. 24	2324	616	48	1745
Ogilvie, William M. (See Cook, Sidney, assignor.)						
Ogle, Eli T. (See McMakin, Rodolph, assignor.)						
Ohio Rake Company. (See Bell, John T., assignor.)						
Ohm, Charles H., San Francisco, Cal. Safety-guard for cars	409,861	Aug. 27	2518	656	48	1181
Olcott, Charles A., North Vernon, Ind. Lawn-mower	408,426	Aug. 6	337	87	48	745
Old Bangor Slate Company. (See Lloyd, Seth, assignor.)						
Oldham, Carrick P., assignor of one-half to S. H. McNutt and E. S. Shepard, Knoxville, Tenn. Machine for stamping and molding soap	407,233	July 16	1826	477 478	48	373
Oldham, Joseph and O., Denton, county of Lancaster, England. Machine for settling and planking felt hat-bodies	406,948	July 16	1395	366 367	48	289
Oldham, Oriando. (See Oldham, Joseph and O.)						
Olds, Henry G. (See Andersen, Peter, assignor.)						
Olin, Edgar W., assignor of two thirds to A. E. Burnam and J. W. Johnston, Pueblo, Colo. Heating apparatus	410,736	Sept. 10	936	253	48	1454
Oliver, William G., Waupun, Wis. Street-lamp	408,988	Aug. 13	1199	318	48	917
Olmstead, Homer E., Decatur, Mich. Running-gear for vehicles	406,296	July 2	377	102	48	76
Olney, Charles D., *et al.* (See Cowell, Julius J., assignor.)						
Olp, Robert, Manitowoc, Wis. Flour-sifter	409,491	Aug. 20	1958	519	48	1073
Olson, Jacob, Muchachinock, assignor of one-half to J. E. Buxton, Oskaloosa, Iowa. Coal-hoist	411,166	Sept. 17	1580	429	48	1593
Oneida Community. (See Kelley, Harry E., assignor.)						
Ongley, Charles E., New York, N. Y., assignor to Hydraulic Elevator Company, of Illinois. Electrically-controlled elevator	410,180	Sept. 3	58	15, 16	48	1220
Ongley, Charles E., New York, N. Y. assignor to Hydraulic Elevator Company, of Illinois. Elevator	410,181	Sept. 3	63	16	48	1221
Ongley, Charles E., New York, N. Y., assignor to Hydraulic Elevator Company, of Illinois. Electrically-controlled elevator	410,182	Sept. 3	65	16, 17	48	1221
Ongley, Charles E., New York, N. Y., assignor to Hydraulic Elevator Company, of Illinois. Electrically-controlled elevator	410,183	Sept. 3	69	17	48	1222
Ongley, Charles E., Yonkers, N. Y., assignor to Hydraulic Elevator Company, of Illinois. Electrically-controlled elevator	410,184	Sept. 3	72	18	48	1222
Opal, Jonas E., Lake Linden, Mich. Padlock	411,054	Sept. 17	1398	375	48	1557

Alphabetical list of patentees, July to September, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Oppenheim, Eli, Baltimore, Md. Shirt	410,376	Sept. 3	371	99	48	1342
Oppermann, Adolf F., Chicago, Ill. Filament for incandescent electric lamps	408,740	Aug. 13	828	218 219	48	844
Ordner, John L., Thompson, Ohio. Car-coupling	407,605	July 23	2383	619	48	492
Ore Reduction Company. (See Geetz, George W., assignor.)						
Oriel Cabinet Company. (See Davis, George P., assignor.)						
Orr, Jesse, assignor to Orr, Painter & Co., Reading, Pa. Door for stove-ovens	408,191	July 30	3280	856	48	665
Orr, Louis H., Springfield, Mass. Calendar	408,041	July 30	3031	793	48	621
Orr, Painter & Co. (See Orr, Jesse, assignor.)						
Orr, Walker P. (See Gaines and Orr.)						
Orr, William, and P. S. Brown, Glasgow, county of Lanark, Scotland. Sheet-metal structure	407,111	July 16	1646	431	48	338
Orrell, Ephraim E., Ware, Mass. Shuttle-box-operating device for looms	410,850	Sept. 10	1107	298	48	1491
Orrett, John. (See Powter, Nathaniel B., assignor.)						
Orser, Levi, Galveston, Tex. Feeder for power printing-presses	406,058	July 2	50	14, 15 16	48	12
Orser, Levi, Galveston, Tex. Feeder for treadle printing-presses	406,059	July 2	54	17 18	48	13
Ortell, Otto, and W. Rottman, Union, N. J. Frame for ruling slates	408,367	Aug. 6	273	67	48	732
Osborne & Cheesman Company. (See Kennedy, John, assignor.)						
Osborne, John H., Auburn, N. Y. Waste-basket	408,129	July 30	3180	832	48	648
Osgood, George W. (See Arnold, Eliphas W., assignor.)						
Ostermann, Heinrich, and C. Lacroix, assignors to Usine Genevoise de Dégrossissage d'Or, Geneva, Switzerland. Non-magnetic alloy	408,130	July 30	3181	.....	48	648
Ostheimer, Alfred J. (See Seyberth, Johann, assignor.)						
Otis Brothers & Company. (See Smith, Rudolph C., assignor.)						
Otis, James. (See Cope, Oliver, assignor.)						
Otis, Phillip A., Leeds, Mass. Button-making machine	409,225	Aug. 20	1570	414	48	996
Otis, William F., Norwalk, Ohio. Sewing-machine treadle	408,131	July 30	3181	832	48	648
Otte, Adrian, Grand Rapids, Mich. Laundry-press	408,132	July 30	3183	832	48	649
Ottignon, Augustus W., Boston, Mass. Adjustable broom band or clasp	406,850	July 9	1247	330	48	249
Otto, Nicolaus A., Cologne, assignor to Gas-Motoren-Fabrik-Deutz, Deutz-on-the-Rhine, Germany. Igniting apparatus for gas or oil motor-engines	406,762	July 9	1112	295	48	225
Otto, Nicolaus A., Cologne, Prussia, assignor to Gas-Motoren-Fabrik-Deutz, Deutz-on-the-Rhine, Germany. Motor-engine worked by the combustion of spray of petroleum	407,234	July 16	1830	478	48	374
Otto, Nicolaus A., Cologne, Prussia, assignor to Gas-Motoren-Fabrik-Deutz, Deutz, Germany. Reversing mechanism	410,012	Aug. 27	2725	716	48	1223
Otto, Richard, Plauen, Saxony, Germany. Sewing-machine	408,427	Aug. 6	339	87	48	745
Oulton, James W., Cambridge, and D. A. Meister, assignors of one-half to C. A. Morse, Boston, Mass. Camp-stool	408,741	Aug. 13	829	219	48	844
Overhalt, Abraham. (See Myers, George W., assignor.)						
Overlack, Bernard, Boston, Mass. Non-conductive and elastic water-proof composition for pipe-joints, &c.	406,949	July 16	1397	.....	48	289
Overman, Albert H., Newton, assignor to Overman Wheel Company, Boston, Mass. Velocipede	406,461	July 9	648	182	48	140
Overman, Albert H., Newton, assignor to Overman Wheel Company, Boston, Mass. Brake for velocipedes	406,462	July 9	650	183	48	140
Overman Wheel Company. (See Overman, Albert H., assignor.)						
Overpeck, Lucien C., Hamilton, Ohio. Photographic light apparatus	406,299	July 2	378	103	48	76
Owen, Frederick D., Washington, D. C. Rotary engine	409,800	Aug. 27	2436	638 639	48	1167
Owen, John M., and J. R. Roberts, Youngstown, Ohio. Hat and coat rack	406,532	July 9	767	208	48	160
Owen, Silas R., St. Joseph, Mo. Street-car door	409,492	Aug. 20	1959	518	48	1073
Owens, William J., Utica, N. Y. Grate	411,391	Sept. 17	1901	507	48	1454
Pace, Jeff. D., Gibsland, La. Folding ironing-table	407,790	July 30	2652	686	48	550
Packard, James W., assignor of one-half to N. Hubbard, Brooklyn, N. Y. Vacuum-pump	406,110	July 2	122	30	48	25
Packer, Edmund H. (See Johnson and Packer.)						
Packer, George W., Rock Falls, Ill. Hoop-driving machine	409,297	Aug. 20	1680	442	48	1017
Packham, Frank R. (See Patric and Packham.)						
Packham, Frank R., assignor to Superior Drill Company, Springfield, Ohio. Grain-drill	410,436	Sept. 3	474	127	48	1361
Page, Albert A., assignor to Sargent & Company, New Haven, Conn. Spring-hinge	407,606	July 23	2389	620	49	492
Page, Clark D., assignor to Page's Patent Brick Kiln Company, Rochester, N. Y. Brick-kiln	406,463	July 9	651	183 184	48	140
Page, Samuel. (See Brown and Page.)						
Page, William N., Powellton, W. Va. Coal-conveyer	410,185	Sept. 3	75	18, 19	48	1282
Page's Patent Brick Kiln Company. (See Page, Clark D., assignor.)						
Paine, George C., Boston, assignor to J. A. Hurd, Salem, A. E. Towne, Boston, and C. D. Moore, Chelsea, Mass. Buckle	406,403	July 2	541	151	48	108
Paine, Robert A., Richmond, Va. Pool-table	409,060	Aug. 13	1306	345	48	937
Paine, Seth W., Rochester, N. Y., assignor to W. S. King, Minneapolis, Minn. Lasting-machine	406,763	July 9	1114	295	48	225
Paine, William H., New York, N. Y. Tension device for the cables of cable railways	411,675	Sept. 24	2325	616	48	1745
Painter, Park. (See Kornblum, Brashear, and Painter.)

Robinson, Matthew H., *et al.* (See Mansfield, George W., assignor.)						
Robinson, Rachel A., Boston, Mass. Calendar	411,061	Sept. 17	1408	376	48	1559
Robinson, Stillman W., and S. P. Watt, Columbus, Ohio, assignors to Wire Grip Fastening Company, Boston, Mass. Machine for uniting soles and uppers of boots or shoes	410,927	Sept. 10	1215	327 / 328	48	1512
Robinson, Walstein E., Bellport, N. Y. Spinning-top	408,749	Aug. 13	841	224	48	848
Robinson, William G. (See Rogers, Thomas B., assignor.)						
Robson, James A., New York, N. Y. Draft-spring for vehicles	408,437	Aug. 6	349	91	48	747
Roche, Emile, Rhéims, France. Weighing-machine	409,302	Aug. 20	1685	444	48	1018
Rockett, Thomas T., Philadelphia, Pa. Cover for radiators	406,772	July 9	1129	299	48	227
Rockett, Thomas T., Philadelphia, Pa. Grate	408,526	Aug. 6	488	129	48	775
Rockford Watch Company. (See Troller, Albert, assignor.)						
Rockwell, Albert F., Jacksonville, Fla. Door-bell	410,449	Sept. 3	493	131	48	1364
Rockwell, Albert F., assignor, by mesne assignments, to New Departure Bell Company, Bristol, Conn. Door-bell mechanism	411,395	Sept. 17	1906	504 / 505	48	1654
Rockwell, Frederick C. (See Furlong, Lawrence F., assignor.)						
Rockwell, Frederick C., Hartford, Conn. Pipe-coupling	410,293	Sept. 3	240	61	48	1316
Rockwell, Morgan F., and G. W. Pearsall, Chattanooga, Tenn. Timber-coupling for framed structures	408,750	Aug. 13	842	224	48	848
Rockwell, Walter S. (See Belmore and Rockwell.)						
Rockwell, Warren C., assignor to I. Goldschmidt and G. B. Renn, Mount Carmel, Pa. Attachment for miners' lamps	410,562	Sept. 3	645	173	48	1395
Rodecker, Peter W., Sidney, Ohio. Washing-machine	408,527	Aug. 6	489	129 / 130	48	775
Rodeheaver, Jared H., Terra Alta, W. Va. Device for locking a series of drawers	410,378	Sept. 3	373	96	48	1343
Rodh, Moses. (See McEnerney, John, assignor.)						
Rodham, William, Shullsburg, Wis. Hay-elevator	409,303	Aug. 20	1688	444	48	1019
Rodie, Robert S., Jersey City, N. J. Steam-boiler	406,235	July 2	292	80, 81	48	58
Roe, Alpheus E., assignor to H. L. Tatum and J. J. Bowen, San Francisco, Cal. Crushing-mill	411,614	Sept. 24	2239	594	48	1727
Roeder, Jonas E., Philadelphia, Pa. Powder-box	407,449	July 23	2171	560	48	447
Roeder, Jonas E., Philadelphia, Pa. Window	411,615	Sept. 24	2240	593	48	1727
Roemer, William, Newark, N. J. Bag or satchel frame	406,594	July 9	846	220	48	175
Roemer, William, Newark, N. J. Trunk stay or brace	406,595	July 9	847	220	48	175
Roensch, Hugo, Habelschwert, Germany, assignor to A. Schilling, San Francisco, Cal. Paper box	407,964	July 30	2923	761	48	600
Roepert, Frederic. (See Hansen and Roepert.)						
Roeske, Henry, Philadelphia, Pa. Apparatus for purifying water	407,250	July 16	1855	483	48	378
Roessler, Franz, Perth Amboy, N. J. Decorating base metals, glass, &c., with precious metals	407,305	July 16	1931	.....	48	393
Rogers, Andrew W., assignor to S. W. Winslow, trustee, Beverly, Mass. Abrading-covering for buffers	407,245	July 16	1847	482	48	377
Rogers, Andrew W., assignor to S. W. Winslow, trustee, Beverly, Mass. Buffer	407,246	July 16	1849	482	48	377
Rogers, Andrew W., assignor to S. W. Winslow, trustee, Beverly, Mass. Abrading-covering for buffers	407,247	July 16	1852	483	48	377
Rogers, Andrew W., assignor to S. W. Winslow, trustee, Beverly, Mass. Abrading-covering for buffers	407,248	July 16	1853	483	48	378
Rogers, Andrew W., assignor to S. W. Winslow, trustee, Beverly, Mass. Abrading-covering for buffers	407,249	July 16	1851	483	48	378
Rogers, Charles D., assignor to American Screw Company, Providence, R. I. Die for rolling drive-screws	408,528	Aug. 6	490	130	48	775
Rogers, Charles D., assignor to American Screw Company, Providence, R. I. Screw-swaging machine	408,529	Aug. 6	492	130 / 131	48	775
Rogers, Charles D., assignor to American Screw Company, Providence, R. I. Forming screw-threads upon screws	408,530	Aug. 6	495	131 / 132	48	776
Rogers, Charles D., assignor to American Screw Company, Providence, R. I. Wood-screw	408,531	Aug. 6	497	132	48	776
Rogers, Charles D., assignor to American Screw Company, Providence, R. I. Screw-swaging machine	408,673	Aug. 6	716	186 / 187	48	816
Rogers, Charles D., assignor to American Screw Company, Providence, R. I. Wood-screw	410,697	Sept. 10	860	223 / 224	48	1443
Rogers, Charles D., assignor to American Screw Company, Providence, R. I. Drive-screw	410,698	Sept. 10	862	224	48	1443
Rogers, Edmund D., Church End, Finchley, county of Middlesex, England, assignor to P. Wilcox, New York, N. Y. Means for securing stereotype-plates which are cast separately from their beds	406,371	July 2	486	126	48	97
Rogers, Francis M., *et al.* (See Morrison, Horatio B., assignor.)						
Rogers, Jonathan J., and O. S. Kennedy, Fort Worth, Tex. Seeding attachment for disk-harrows	406,147	July 2	174	50	48	35
Rogers, Junius, Fremont, Nebr. Account-book	406,478	July 9	671	182	48	144

Alphabetical list of patentees, July to September, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume		Official Gazette.	
			Spec.	Drg.	Vol.	Page.
Rogers, Newton, and J. A. Wharry, Terre Haute, Ind. Apparatus for vaporizing oil and water and superheating and burning the same	407,901	July 30	2294	735	48	581
Rogers, Seymour, assignor to H. W. Hartman, Beaver Falls, Pa. Wire mat	408,047	July 30	3038	795	48	623
Rogers, Thomas B., Brooklyn, assignor of one-half to W. G. Robinson, New York, N. Y. Railway chock or stop-block	406,855	July 9	1255	331	48	250
Rogers, Winfield S., assignor to Universal Radial Drill Company, Cincinnati, Ohio. Drilling-machine	411,616	Sept. 24	2242	596	48	1728
Rogers, Winfield S., assignor to Universal Radial Drill Company, Cincinnati, Ohio. Shafting-chuck	411,731	Sept. 24	2404	637	48	1762
Rohan, Philip, St. Louis, Mo., assignor of one-half to E. L. Babcock, Cuyahoga Falls, Ohio. Steam-boiler	407,251	July 16	1856	484	48	378
Rolled Steel Carriage Wheel Company. (See Everson, George H., assignor.)						
Roller, Louis F., Rutledge, Pa. Suspension-hook	409,239	Aug. 20	1590	419	48	999
Rollins, George L., Bridgewater, Mass. Friction-clutch pulley	406,063	July 2	61	16	48	15
Romain, Aristide, New Orleans, La. Car-coupling	410,928	Sept. 10	1217	328	48	1510
Romaine, Charles N., *et al.* (See Del Grande, Antonio, assignor.)						
Romig, Darwin S., *et al.* (See Banks, George L., assignor.)						
Rondinella, Lino F., Philadelphia, Pa. Drawing-instrument	411,617	Sept. 24	2343	596	48	1728
Roney, William R., Chicago, Ill. Furnace	409,650	Aug. 20	2190	577	48	1115
Roney, William R., assignor to Westinghouse, Church, Kerr & Company, of New Jersey. Steam-boiler furnace or other furnace	409,304	Aug. 20	1689	444 / 445	48	1019
Roney, William R., Chicago, Ill., assignor to Westinghouse, Church, Kerr & Company, of New Jersey. Furnace-grate	409,305	Aug. 20	1693	445	48	1020
Rood, Amos D., assignor to N. G. Rood and T. B. Bryan, Chicago, Ill. Type	407,195	July 30	3286	856	48	666
Rood, Amos D., assignor to N. G. Rood and T. B. Bryan, Chicago, Ill. Type						
Rood, Netta G., *et al.* (See Rood, Amos D., assignor.)						
Rooke, Henry A., Liverpool, county of Lancaster, England. Roller-bearing for pulley-blocks	407,693	July 23	2508	647	48	515
Roop, Jacob W. (See Duffins, Joseph H., assignor.)						
Roosevelt, James A., Hempstead, Tex. Mail-bag fastening	410,450	Sept. 3	494	132	48	1365
Root, Roswell L. (See Hamilton, Clarence J., assignor.)						
Roovers, Alfred W., Brooklyn, N. Y. Coin-operated machine	407,639	July 16	1524	399	48	313
Roper, Robert G., Needham, assignor to G. W. Simmons & Co., Boston, Mass. Bicycle-tights	408,472	Aug. 6	350	91	48	748
Roper, Sylvester H., Boston, Mass. Magazine-gun	409,429	Aug. 20	1870	493	48	1056
Roquemore, Peter G., assignor of one-half to J. H. Thompson, Marshall, Tex. Automatic air-brake coupling	407,839	July 30	2728	709	48	563
Rosasco, John, Healdsburg, assignor of one-half to J. Cuneo, San Francisco, Cal. Fruit-pitting machine	407,965	July 30	2924	761	48	601
Rose, George P., Fenton, Mich. Lag-screw	408,731	Aug. 13	843	224	48	848
Rose, George P., Fenton, Mich. Screw	411,902	Sept. 17	1634	435	48	1604
Rose, James M., Allegheny, Pa. Manufacturing gas	408,532	Aug. 6	497	132	48	776
Rose, James M., Allegheny, Pa. Apparatus for the manufacture of gas	408,533	Aug. 6	501	133	48	776
Rose, James M., Allegheny, Pa. Manufacturing gas	408,534	Aug. 6	505	133	48	777
Rose, James M., Allegheny, Pa. Manufacture of gas	408,535	Aug. 6	508	133 / 134	48	777
Rose, James M., Allegheny, Pa. Apparatus for the manufacture of gas	408,536	Aug. 6	512	134	48	777
Rose, James M., Allegheny, Pa. Apparatus for the manufacture of gas	408,674	Aug. 6	719	187	48	816
Rose, Robert, Calliope, Iowa. Grate-bar for fire-engines	410,929	Sept. 10	1217	328	48	1512
Rosenberger, Abraham, Chicago, Ill. Nail-extractor	407,371	July 23	2048	530	48	423
Rosenthal, David, Hudson, N. Y. Letter-box	410,379	Sept. 3	375	100	48	1343
Rosenthal, Felix L., *et al.* (See Pifferling, Emanuel, assignor.)						
Rosewater, Andrew, Omaha, Nebr. Flushing-tank	410,930	Sept. 10	1218	328 / 329	48	1513
Rosier, Thomas R., Sioux Falls, Dak. Ter. Fire-extinguisher	410,931	Sept. 10	1221	329	48	1513
Ross, Abbott Q., Cincinnati, Ohio. Roll-paper holder and cutter	408,752	Aug. 13	844	225	48	848
Ross, Christian H., assignor to Daschy Iron Works, Chicago, Ill. Vault-light	410,380	Sept. 3	376	100	48	1343
Ross, Josiah, Buffalo, N. Y. Automatic balancing device for swing-saws	410,199	Sept. 3	107	28	48	1290
Ross, Simon, Jr., Linwood, Ohio. Shoe-beading machine	408,537	Aug. 6	516	135	48	778
Ross, Simon, Jr., Linwood, Ohio. Shoe-burnishing machine	409,240	Aug. 20	1591	419	48	999
Ross, Simon, Jr., Linwood, Ohio. Heel-burnishing machine	410,932	Sept. 10	1222	329	48	1513
Ross, Simon, Jr., Linwood, Ohio. Apparatus for loading or unloading freight	410,737	Sept. 10	938	251	48	1455
Ross, William E., Sparta, N. J. Anti-friction bearing	409,430	Aug. 20	1872	493 / 494	48	1056
Rosser, David. (See McFaddon and Rosser.)						
Rossney, William C., Hyde Park, assignor of two-thirds to W. Threlkeld and C. L. Hunt, Boston, Mass. Gas-regulator	411,062	Sept. 17	1409	377	48	1560
Rossney, William C., Hyde Park, assignor of two-thirds to W. Threlkeld and C. L. Hunt, Boston, Mass. Gas-regulator	411,063	Sept. 17	1410	377	48	1560
Rost, Ernst, Dayton, Ohio. Hydrocarbon-burner	411,260	Sept. 17	1713	438	48	1630
Rote, Charles V., assignor of part to B. J. McGraun, E. G. Smith, and E. E. Snyder, Lancaster, Pa. Car-brake	406,958	July 16	1406	369 / 370	48	291
Roth, Lawrence, Cincinnati, Ohio. Truss-hoop	409,241	Aug. 20	1592	420	48	1000
Rothchild, Samuel, Pendleton, Oreg. Harrow	408,930	Aug. 13	1115	293	48	901
Rottman, William. (See Ortell and Rottman.)						
Round Valve Company. (See Reasor, Warren T., assignor.)						
Roundtree, John T., New Hampton, Mo., assignor of one-half to J. W. Coulter and E. H. Grantham. Horse-collar fastener	411,110	Sept. 17	1502	396	48	1577
Rousel, Theodore C., Chelsea, county of Middlesex, England, assignor to B. Rouxel, Légué, France. Artist's drawing-board	408,675	Aug. 6	722	188	48	817
Roux, Ernest J., assignor to Ancienne Fabrique Vacheron and Constantin, (limited,) Geneva, Switzerland. Hand-setting mechanism for watches	406,307	July 2	397	108	48	60
Rouxel, Benjamin. (See Rousel, Theodore C., assignor.)						
Rowbotham, John and W., Merchantville, N. J.; said W. Rowbotham assignor to said John Rowbotham. Sectional steam-boiler	407,744	July 23	2580	668 / 669	48	530
Rowbotham, William. (See Rowbotham, John and W.)						
Rowe, Edward, Indiana, Pa. Revolving jail	407,677	July 30	2790	725 / 726	48	575
Rowe, Ellis L., assignor to Rensselear Manufacturing Company, Lansingburg, N. Y. Hydrant	410,026	Aug. 27	2744	721	48	1227
Rowe, Willis H., *et al.* (See Dunlap, John W., Sr., assignor.)						
Rowell, Almon B., assignor to Bartlett & Rowell, Sunapee, N. H. Hame attachment	409,505	Aug. 20	1976	522	48	1077
Rowell American Switch Company. (See Rowell, Benton C., assignor.)						
Rowell, Benton C., assignor to Rowell American Switch Company, Boston, Mass. Automatic railway-switch	410,200	Sept. 3	109	28	48	1290

Alphabetical list of patentees, July to September, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.

Rowell, John S., Beaver Dam, Wis. Spring cultivator-tooth	410,769	Sept. 10	990	266	48	1466
Rowland, Thad. H., *et al.* (See Hopkins, Edwin F., assignor.)						
Royce, Charles. (See Miller, Charles W., assignor.)						
Royce, Charles F., and G. E. Gies, Allegheny, Pa. Wrecking-frog	406,236	July 2	294	81	48	59
Royer, David H., Millmont, Pa. Shutter-worker	407,119	July 16	1658	433, 434	48	340
Royle, Vernon, Paterson, N. J. Shedding mechanism for looms	410,718	Sept. 10	905	243, 244	48	1449
Rozzelle, Marion. (See Peck and Rozzelle.)						
Ru Ton, Hiram W., and H. A. Gore, Goshen, Ind. Broadcast seed-sower	409,373	Aug. 20	1793	472	48	1039
Rubber and Celluloid Harness Trimming Company. (See Read, James A., assignor.)						
Rubin, Mayer, Chicago, Ill. Suspenders	410,855	Sept. 10	1116	300	48	1492
Ruddock, Andrew, *et al.* (See Arnold and Yergin, assignors.)						
Rudy, William H., Hagerstown, Md. Velocipede	408,634	Aug. 6	654	170	48	805
Rueckert, Michael. (See Lawrence and Rueckert.)						
Rueckert, Michael, St. Mary's, Mo. Padlock	410,027	Aug. 27	2747	722	48	1228
Ruef, Charles S., assignor to Grand Detour Plow Company, Dixon, Ill. Disk harrow	408,196	July 30	3287	858	48	666
Ruffhead, Thomas G., Renovo, Pa. Car-door fastener	410,807	Sept. 10	1049	281	48	1179
Rullmann, John D., and G. Eckenroth, San Antonio, Tex.; said Rullmann assignor to said Eckenroth. Velocipede	406,148	July 2	175	50	48	36
Rumberg, Samuel S., Denver, Colo. Winding mechanism	410,254	Sept. 3	177	46	48	1303
Rummel, Joseph P., Mansfield, Ohio. Suspender attachment	408,538	Aug. 6	516	135	48	778
Rumsey, William D., Detroit, Mich. Sleigh	407,120	July 16	1660	434	48	341
Rundquist, William, Elgin, Ill. Holdback-snap	408,990	Aug. 13	1201	317	48	917
Rung, Henry, assignor of one-half to F. S. Upton, Rochester, N. Y. Chuck for rods or tubes	410,738	Sept. 10	940	232	48	1455
Runyon, Edwin E., Mountain Spring, Tex. Bent for suspension-bridges	410,201	Sept. 3	110	28	48	1290
Rusden, Ethelbert A., Manchester, county of Lancaster, England. Bleachery-keir	408,991	Aug. 13	1202	317, 318	48	918
Rush, Madison, Philadelphia, Pa. Stair-rod securer	406,959	July 16	1407	370	48	291
Rushton, Thomas I., Centre Valley, Ind. Wire fence	409,242	Aug. 20	1592	400	48	1000
Russel, Edward B. (See Hicks, William, assignor.)						
Russell, Calvin P. (See Dillard, Robert M., assignor.)						
Russell, Charles M., assignor of one-third to T. B. Lyne, Bowling Green, Ky. Telegraph-pole	406,406	July 2	545	158	48	108
Russell, Edward S., Worcester, Mass. Whistle	408,539	Aug. 6	517	135	48	778
Russell & Erwin Manufacturing Company. (See Burgess, Charles M., assignor.)						
Russell, William O., *et al.* (See Hinman and McCracken, assignors.)						
Russell, William V., Greenville, Ohio. Fence	409,243	Aug. 20	1595	421	48	1000
Rutherford, Adam, and J. Ranch, Basil, Ohio. Hay-rack	407,614	July 23	2399	622	48	494
Ruttan, William, Picton, Ontario, Canada. Device for sharpening saws	408,357	Aug. 6	224	57	48	723
Rutter, Allen E., assignor of one-half to J. A. Gamble, Salem, Ohio. Rail-joint	410,028	Aug. 27	2748	722	48	1228
Ruttmann, Ferdinand S., Plainfield, N. J. Steam-engine	410,451	Sept. 3	495	132	48	1365
Rutzler, Enoch. (See Pindar, Henry, assignor.)						
Ryan, Daniel W. (See Fletsch, Herman, Jr., assignor.)						
Ryan, James B., New York, N. Y. Wire mattress bed-bottom	411,302	Sept. 17	1774	474	48	1631
Ryan, Patrick, New York, N. Y. Saw-set	409,805	Aug. 27	2442	640	48	1168
Rylands, Dan. (See Wilson, John A., assignor.)						
Sabin, Ira A., Kalvesta, Kans. Churn-dasher	406,308	July 2	398	108	48	80
Sachs, Gustav A., Valley City, Dak. Ter. Ornamenting gun-barrels	410,678	Sept. 10	831	223	48	1437
Safety Hatch Door Company. (See Herman, Emile J., assignor.)						
Sageman, Ann M., *et al.* (See Sageman and Seibold, assignors.)						
Sageman, Henry C., and J. Seibold, assignors to A. M. Sageman, Mount Vernon, and G. W. Mabie, Brooklyn, N. Y. Fastening for carriage-curtains	406,773	July 9	1129	299	48	228
Sagendorph, Longley L., Cincinnati, Ohio. Metallic roofing, siding, &c	410,294	Sept. 3	241	62	48	1316
Sagendorph, Longley L., Cincinnati, Ohio. Metallic roofing	411,683	Sept. 24	2138	608	48	1748
Sagendorph, Longley L., Cincinnati, Ohio, assignor of one-half to C. N. Harder, Philmont, N. Y. Metallic finishing for buildings	406,668	July 9	971	262	48	198
Sagendorph, Longley L., Cincinnati, Ohio, assignor of one-half to C. N. Harder, Philmont, N. Y. Metallic molding-strip	407,694	July 23	2509	648	48	515
Sagendorph, Longley L., Cincinnati, Ohio, assignor of one-half to C. N. Harder, Philmont, N. Y. Metallic roofing-sheet	407,966	July 30	2925	762	48	601
Sagendorph, Longley L., Cincinnati, Ohio, assignor of one-half to C. N. Harder, Philmont, N. Y. Metallic ceiling and sheeting strip	410,856	Sept. 10	1117	300	48	1493
Sagle, Joseph R., Baltimore, Md. Coal-cart	407,121	July 16	1662	434	48	341
Sague, James E., Buffalo, N. Y. Apparatus for heating cars	409,306	Aug. 20	1695	446	48	1020
Saltz, Julius J., *et al.* (See Jacoby, Cornelia M., assignor.)						
Saladee, Cyrus W., Cleveland, Ohio. Running-gear for road-wagons	411,473	Sept. 24	2027	537	48	1683
Saladee, Cyrus W., Cleveland, Ohio. Spring-platform for road-wagons	411,732	Sept. 24	2405	637	48	1762
Salisbury, Wilber S., Chicago, Ill. Electric motor for street-cars	408,753	Aug. 13	845	225	48	848
Salisbury, Wilber S., Chicago, Ill. Motor for street-cars	408,754	Aug. 13	847	225, 226	48	849
Sallandrouze, Andre C. H., assignor to Société Sallandrouze Frères, Paris, France. Loom for weaving tufted fabrics	410,096	Aug. 27	2868	752	48	1249
Salmon, Ira A., Boston, Mass. Type-writing machine	406,064	July 2	62	19	48	15
Salom, Pedro G. (See Morris and Salom.)
